The latest silly story in yachting, apparently a pure fake, as it has been promptly denied by Sir Thomas Lipton, was to the effect that, as the Herreshoffs had never built any schooners, Sir Thomas would challenge in 1901 with a schooner, designed by Mr. Watson and built this winter so as to have a season's trial, the challenge being made in September, 1900, for a race in May, 1901. The only good purpose served by the yarn was the providing of big headlines for the evening papers. It evidently had no foundation whatever, but was cabled across for this purpose. At the present time there is no certainty as to any plans for next year. Sir Thomas Lipton will probably alter and refit Shamrock for the home racing against Meteor II. and the new Watson cutter for C. D. Rose, now nearly ready for launching. Columbia may or may not go abroad, either to the Mediterranean in the spring or later to the British races, but as no positive statement has been made by her owners, the reports circulated from day to day are but guesses at best.

On Nov. 16 Columbia was hauled out on the marine railway at Hawkins' Yard, City Island, Defender being already struck over on to the adjoining bulkhead, where preparations are being made to roof her over and protect her thoroughly from the weather. As she now lies on the railway, free to the eye or to the camera for a short time, Columbia is an interesting study, especially in comparison with Defender, a few feet away. The form of the old boat is in the main more pleasing to the eye than the new one. The midship section is a continuous S curve, with no straight tangent between the bilge and the hollow of the floor, while in Columbia the bilge itself is harder than in Defender, and below it is a marked flat to the floor, with a sharp hollow joining it to the fin. The form of middle body resulting from Defender's easy section is more pleasing to the eye than that of Columbia; but in the new boat the fore and aft lines are carried out more easily and smoothly, especially in the counter,

which is longer and finer than in Defender. The sternpost of Columbia is set further forward than in Defender, with about the same rake, and the horn timber, being, of course, longer, is also more curved on the lower end between the waterline and the tuck. The workmanship on Columbia is somewhat better than on Defender, the plating and the whole form being fairer. The lead keel of Columbia, perfectly flat on the bottom, both fore and aft and thwartships, except for a slight rounding of the corners at the fore end, is a tremendous lump of metal, looking to be about 7ft. high at the fore end and nearly 4ft. through on the bottom, tapering upward with almost straight sides into the neck of the fin, which looks even thinner than that of Defender. The plating of Columbia is in excellent condition, both above and below the waterline, but the aluminum topsides of Defender show signs of corrosion. Columbia will be entirely covered from view in a short time. Columbia's spars are stored in a lot on the other side of the road from the two yachts, with a house built over them. Much of her stuff, including sails and gear, is stored at Mr. Iselin's home, at New Rochelle.

On the beach beside Columbia and Defender are several interesting yachts—Colonia, Navahoe and Emerald in particular—all high and dry for the winter. In close company to these modern flyers is one of the historic yachts of the American fleet, the old Vindex. As she lies she is a sad sight to those old-timers who knew and loved her and her owner, "Watch-tackle Bob." She was condemned and sold several years ago, and has since laid on the beach awaiting a convenient time for breaking up, which has at last come. Her decks and joiner work are now a pile of kindling wood underneath her bilge, and a gang of men with heavy sledges and cold chisels are reducing her as rapidly as possible to old scrap. The process is a slow one, as she was built to last, in marked contrast to the flimsy racers of to-day. The frames, floors and gussets bear testimony to the staunch work of her designer, Mr. A. Cary Smith, in his first experiment in iron construction in 1871. Her joiner work, of solid mahogany, would fit out as far as amount of material goes, a modern yacht as large as Defender. It is a pity that Vindex has been allowed to go to the scrap heap in this way; she should have had a permanent resting place, high on the beach at Oyster Bay, with a solid foundation under her, where she could have been used for a bath house or similar purpose; a fitting and lasting monument to the greatest and best of American Corinthians, Robert Center.

The Seawanhaka Cup.

A general meeting of the Royal St. Lawrence Y. C. was held at the Windsor Hotel, Montreal, on Wednesday, Nov. 15. The main business of the meeting was the consideration of the recent correspondence between the sailing committee of the club and the race committee of the Seawanhaka Cor. Y. C. in connection with the races of 1899 and the challenge for 1900 for the Seawanhaka international challenge cup. In accepting the challenge of the White Bear Y. C. for a match in 1900, the Royal St. Lawrence Y. C. agreed with the challenge on certain new conditions, which were submitted to the Seawanhaka Cor. Y. C. as the original donor of the cup for its approval. The reply of the Seawanhaka race committee has not been made public in full, but it was of such a nature as to give great offense to the Montreal yachtsmen. The following extracts give its general tenor:

"We must decline to express any opinion or assume any responsibility concerning the proposed agreement. It is our opinion that the action was not only beyond the jurisdiction of your sailing committee, but also beyond the power of your organization. * * * All courses shall be laid out in waters of suitable depth for the competing yachts and of sufficient expanse to permit of each leg of each course being not less than three miles in length. * * * It follows you have no right to accept a challenge from the White Bear Y. C. Under these circumstances we shall feel impelled to advise our club, whom we have consulted, that, in our opinion, further relations between the two clubs are not admissible, so long as you support the award of your sailing committee."

The letter is signed by Charles W. Wetmore, Walter C. Kerr, Charles A. Sherman, Clinton H. Crane, Johnson de Forrest, who comprise the race committee.

Vice-Com. E. Kirke Greene presided at the meeting in the absence of Com. Ross. Two reports were read, from the executive committee and from the sailing committee, as follows:

International Races—The two principal events were the international races sailed in June and in July and August; the former series being the result of a friendly challenge from the White Bear Y. C., of St. Paul, to race the sloop Yankee, owned by Mr. Ordway, and designed by Mr. Reed, against Com. Ross' Dominion, designed by Mr. G. H. Duggan.

The White Bear Club had challenged for the Seawanhaka cup. Your committee, however, with a view to healing the differences between our club and the Seawanhaka Corinthian Y. C. (that had so marred the international series of season 1898), arranged that the Seawanhaka Club challenge should be accepted; and they were glad to accept also the friendly and sportsmanlike challenge of the White Bear Y. C. to race the Yankee, their selected yacht of 1898, against the Dominion. For this series the Royal St. Lawrence Y. C. provided a special trophy. The races were held, commencing on June 12. Four races in all were sailed, the third race being unfortunately made noteworthy by the Dominion breaking her mast short off when jibing round second buoy of the triangular course in the first round. The Dominion won the other three races and the cup.

A considerable amount of public interest here was evinced in the race, and a large party came from the West to support the challenging yacht.

Your committee desire to express their strong sense of the helpful and sportsmanlike attitude of the challengers throughout this contest on every question that arose for settlement; and the sailing committee's duties were considerably lightened in a way that is heartily acknowledged.

25ft. Class—Fixtures were made for this class beginning on May 13 to July 17, the date of the Seawanhaka trial races. Only one new boat was built—the Glencairn III.—and she was not ready till after the White Bear races. As a class these boats this year have been disappointing, the fixtures entirely failing to call forth anything like adequate racing for the "tuning up" of possible cup defenders. The Speculator was duly commissioned early in the season, but difficulty was often found in obtaining the necessary crews.

22ft. One-Design Class—This was a new class of boats altogether, and proved exceedingly popular. Three boats originally were built at the Yacht Company's shed. Owing to heavy weather, just after launching, one was disabled; and the season was well advanced before another boat was built and this one repaired. In consequence, the handsome trophy presented by the vice-commodore could not be fully competed for this year, but the class as a whole proved a complete success, and much racing took place between the boats on all parts of the lake. Mr. Greene's trophy, it was decided, should be reserved for next year's racing.

17ft. Class—This class was also well taken up this year, three new boats (making five in all) being commissioned. Racing between them was keen throughout the season. Owing to its size and limited cost, this class bids fair to be a popular one, and your committee urge that both these classes—the 22-footers and the 17-footers—should be amply provided for in next year's fixtures.

Larks—Fixtures were arranged for this class, but so few of our younger members appear to have built into it that no races were actually held. Your committee, however, feels the necessity of a class of this size of boat, or even smaller, for the junior members of the club. A new class of 20ft. dinghy is now being built at the Yacht Company's shed, and should fill the requirements of our younger members, who are learning to sail.

25ft. Class and Cruising Boats—Five races were arranged for these boats, at not one of which did sufficient boats turn up to make a race except on Dominion Day, on which day the Sir Donald A. Smith cup was sailed for in heavy weather. After certain after-dinner speeches it was shown that the total lack of interest in these races was a disappointment, and your committee would suggest that a special committee be appointed to consider measurement rules, so as to avoid the very unsatisfactory lack of system in our present methods of handicapping. There can, moreover, be no doubt that a club steamer would be found to be especially useful in facilitating racing in this class.

Squadron Cruises—Two cruises were held this year. Both were a success. Special thanks are due to the untiring efforts of one of our Upper Lake members in chartering a steam tender to accompany the yachts and in organizing all the arrangements that made the cruise an unqualified success.

Recommendation—Your committee beg to recommend that a strong effort be made to have a club steamer arranged for early next year, as they are persuaded that with its help races might be held to advantage both over the international courses and at various points upon the lake. In your committee's opinion, this is essential; only with it can racing on the lake be efficiently organized. Further, it is desirable to have built this winter proper permanent buoys of large size for marking the courses. It is also important that the incoming committee should have a clear understanding with the executive as to the responsibility for the control of the harbor and pier at Dorval.

Thanks are due to Mr. G. H. Duggan and to the crews who so ably assisted him for their successful work in the international races; to Mr. Barclay Stephens for his generosity in placing his steam yacht, the Dama, at the disposal of our committee, thereby rendering material assistance during the races; and to other gentlemen who were good enough to allow their steam yachts to act as a patrol fleet, and otherwise to assist the committee.

International Races for 1900—Your committee have pleasure in announcing that they have formally accepted the challenge of the White Bear Y. C., of St. Paul, to race for the Seawanhaka international trophy next year.

For the committee, J. J. Riley, Chairman.

Draft report of sailing committee of Royal St. Lawrence Y. C., of the Seawanhaka Corinthian international cup races.

By mutual arrangement these races were this year held in July and August, in order not to interfere with the international races for the Canada's cup on Lake Ontario.

Constance, the challenging yacht, arrived at Dorval on Saturday, July 22. On Monday, July 24, your committee, together with Mr. Duggan, met Mr. R. H. Post, who was authorized by a letter from the Seawanhaka Corinthian Y. C., to represent them, a copy of the letter being annexed to this report, and Mr. E. M. Post being also present, and arranged special conditions to govern the series of races. Mr. Post and Mr. Crane, who (with others) had been nominated as helmsman of Constance, subsequently expressed strongly their desire to modify the clause giving the sailing committee power to start the race up till 3 o'clock, with the object of allowing either party a veto upon the start, if not made at the hour definitely mentioned in the agreement, namely, 1:15, but the conditions as annexed were finally agreed to, and were signed by the representatives of the respective clubs on the 27th of July. They are also annexed hereto. The final measurements of the two yachts were as follows:

Constance	19,875
Glencairn III.	19,785

The first race, scheduled for Thursday, July 27, was, owing to heavy weather, postponed by the sailing committee, at the desire of both contestants.

The first race, windward and return, was held on Friday, July 28, Constance winning. The official timing is annexed.

The greatest loss of Glencairn III. was on the first leg to windward. It is to be noted that Mr. Duggan in error made for the wrong mark, thus losing considerable time.

The second race, triangular course, was postponed, owing to insufficient wind, from Saturday, July 29, to the Monday following, when it took place in a stiff sailing breeze, Constance winning. The official timing was as annexed.

Glencairn III. again suffered her greatest loss in the first leg of the course, beating to windward; it seemed to all that Constance stood up better to her work in the weather prevailing.

The third race, windward and return, was held on Tuesday, Aug. 1, and resulted in a victory for Glencairn III., which passed Constance on the second run to leeward, and was not again overtaken. The official timing was as annexed.

The fourth race, held Wednesday, Aug. 2, was marked by very varying weather, a thunder squall striking the boats just before the completion of the first round. In the end Glencairn III. won, the official timing being annexed.

The fifth race, windward and return, was held on Thursday, Aug. 3. The committee boat, Dama, was on the course shortly after 12 o'clock, and proceeded forthwith to log out the course to windward. This was completed, and the Dama returned in time to start the race about 1:15 P. M. On her return to the starting point, she was hailed by Mr. Crane, who pointed out that the course as laid out was not then dead to windward, as in the interim the wind had veered to the southward. Mr. Post, who, on this occasion, had not desired to come on board the committee boat, formally protested the course on this ground. The committee, anxious to avoid any possible misunderstanding or ground of complaint, decided to alter the course, although they did not consider themselves under any obligation to do so. The starting line was accordingly shifted further inshore, and toward Pointe Claire, but shoal water prevented the starting buoy being placed exactly to leeward of the weather buoy, although practically so, and Mr. Post again protested on the same ground. It was then decided to log out a third course in consequence of this protest. This was done by a member of the committee, accompanied by Mr. Post, on board the Constance tender, Sirius. It was found that the course thus relaid was short a nautical mile and a half, the log registering 1.45 when the proximity of the Beauharnois Shoal made it unwise to go further. Mr. Post again protested on the ground that the course would be too short, and the water too shallow for maneuvering near the weather buoy. The member of the committee on board the Sirius thereupon offered to shorten the course to a mile, but Mr. Post repeated his protest against any course under a nautical mile and a half.

Unfortunately, in returning to the starting buoy the Sirius was slowed down, and considerable time thereby lost. When she reached the committee boat, Mr. Post came on board. So much time had been consumed by the numerous protests and delays that it was doubtful whether the course could be laid in time to start the race by 3 o'clock, at which hour the power of the committee to order the race to be started would expire.

The starting line was again shifted further up the lake toward the Government steamboat wharf, and the fast steam yacht Monaco was at once dispatched with a member of the committee to lay the windward buoy, which was placed in 11ft. of water one and one-half nautical miles from the starting buoy.

Shortly after the Monaco had started, the preparatory signal was given. The boats maneuvered up the lake, and approached each other about the time the second signal was given, Glencairn III. being to windward and a short distance astern. They headed down the lake, passing between the range buoy and the committee boat. When abreast the committee boat Glencairn III. had gained, and was then close on Constance's weather quarter. After passing inshore of the committee boat, and when some 300yds. from the range buoy, Constance, who was still leading, touched her centerboard; but having raised it, was sailing again within a few seconds.

Glencairn III. went about and crossed the line fifteen seconds after the final signal. Constance meanwhile sailed about, eventually coming alongside the committee boat after Glencairn III. had crossed the line. Mr. Crane came on board the committee boat, and after consultation with Mr. Post they gave notice of protest.

Subsequently Mr. Post offered, if the starting line were shifted further off shore, and Glencairn III. recalled, to sail the race over the course thus shortened, but the race having started, the committee considered they had no power to then interfere.

Constance thereupon retired without having crossed the starting line, and Glencairn III. sailed the course alone, finishing it.

During the race the committee located and examined the shoal, which proved to be an isolated patch of limited extent, with a minimum depth of 4ft. of water. This, as well as the different courses laid during the day, and the maneuvering of the boats, is shown on the accompanying diagram, as nearly as possible without an actual survey.

On their return to the club house, a written protest was handed to your committee.

A meeting of the committee was at once called, which was attended by all the members, and this protest having been carefully considered, the committee was unanimously of opinion that the protest should not be sustained. The formal decision of the committee was as follows:

"Royal St. Lawrence Y. C., Montreal, Aug. 3, 1899.—The sailing committee having received the following protest, namely:

"'The sailing committee,

"'Royal St. Lawrence Y. C.—Dear Sirs: I beg leave to enter a protest against the course as laid out for to-day's race, on the ground that there was not sufficient water for the boats to be sailed in. Respectfully yours,

"'Regis H. Post.'

"'Dorval, Aug. 3, 1899.'

for sloop Constance, and having heard the evidence of Mr. Post, Mr. Crane, Mr. Duggan and Mr. W. Riley,

"And having carefully considered all the circumstances of the start in to-day's race of the Seawanhaka Corinthian challenge cup series, decides that there is no sufficient ground for ordering the race to be re-sailed, and accordingly awards the race to Glencairn III.

"Jas. J. Riley, Jr., Chairman,
"Harrison B. Young, Secretary."

Having all the facts before them, the committee unanimously decided that the course was "laid out in waters of suitable depth for the competing yachts." The shoal was too far from the starting buoy to be considered a part of the course laid out; it was inshore from the committee boat; 300yds. from the range buoy; 2,000ft. from the starting buoy, in a line with it and about at right angles to the course.

The committee was most anxious to deal generously in every way with a challenging yacht; and while the formal

protest left them no option but to render the decision as above, they very carefully considered further how far the fact of touching her centerboard could be held to have militated against Constance had she started. Constance did not go fast aground; she merely touched her centerboard, as shown in evidence, about two minutes before the final gun; the incident was absolutely trivial; notwithstanding unnecessary delay in getting Constance under way again, she was sailing when fully a minute and a half had still to run; and the incident would not, in the committee's opinion, have affected her chances had she chosen to start.

This latter report was accompanied by a diagram of the various courses laid out on the last day.

The letter of the Seawanhaka race committee was read to the meeting. Concerning the material points of the dispute, Mr. Duggan made the following statement:

There are a number of our members here who were not present at the last race, and who would perhaps be interested in a fuller account of the events of the day.

When we left the club house at Dorval there was a good working breeze, in which the Constance and Glencairn would have been very evenly matched, and the same condition prevailed at the time Dama started to lay the buoys, but as she was returning the wind hauled to the south and noticeably died away to a breeze of about the same strength as that in which Glencairn had won the previous Tuesday and Wednesday, and which was undeniably in her favor. The wind had shifted about two points off the course, so that the buoy, instead of being dead to windward, could be made in a long and a short leg, one leg, perhaps, twice as long as the other, and the run home would have been with the spinaker guyed well forward, or, perhaps, with a balloon jib.

The practical effect of leaving the course as it was would have been equivalent to laying out a course dead to windward, but slightly shorter, the run home being a very broad reach instead of dead before it, conditions distinctly favorable to Constance, as her previous performance had not shown her better to windward in light weather, and in Tuesday's she was not greatly inferior to Glencairn when on a broad reach, but much slower when dead before the wind. Mr. Crane, however, made protest, claiming that windward work was Constance's best point, a plea undoubtedly correct for fresh breezes, but having no weight in the weather then prevailing.

It may be noted that later in the day the wind hauled again, so that on the third leg it was exactly in its old position, making the first course dead to windward. On the course as finally laid, Glencairn sailed the last three legs with tacking to windward.

The second attempt to lay the course shifted it about a point, making it for all practical purposes dead to windward, although not actually so. The cause for protest was thus even weaker than the first.

The committee then for the third time laid a new course, but unfortunately the weather buoy was close to the sand shoal at the south end. The Seawanhaka representative protested the course on the ground that there was not sufficient water to maneuver round the buoy, which in itself was reasonable, but he then refused to have the buoy set a few hundred yards to the north, or to shorten the course to two miles, six times around, although after the race had started they did offer, if Glencairn were recalled to sail it over a mile course, making it apparent that the objection to the shortened course was to gain time.

It may be noted that the third attempt to set the buoy was made by the Constance's tender, Sirius, and that as she returned to the committee boat, having failed to place it, she stopped almost entirely in the center of the lake, finally reaching the committee boat very close to 3 o'clock. After putting the member of the committee on board the boat, she at once steamed off with the committee's log, so that they were for a time powerless to relay the course. When the Monaco was dispatched to lay the course for the fourth time, Sirius raced her out, having by that time apparently fully recovered her steam, which she had lost shortly before on the run in. The delays had been so considerable that it was apparently only by the utmost exertion that the committee succeeded in making the first signal at five minutes to three, and the Monaco had barely started when the preparatory signal was given.

Referring to the Constance accident, she was, at the time it occurred, under the Glencairn's lee bow, both being on the starboard tack, and if no accident had occurred Glencairn was practically assured of the advantage of the start. This, however, was of small moment, as she was sailing noticeably faster in the wind then prevailing, which was even lighter than it had been when the earlier protests were made. Constance was observed to touch her board slightly, keep on sailing without making any effort to alter her course for perhaps 20ft., and again strike it so that it stopped her altogether. Two of her crew, following a natural impulse, at once raised it slightly, but dropped it again, and all four stood up protesting that they were aground. Glencairn at that time went about, exactly two minutes ten seconds before the gun, and about 30ft. from Constance. Constance's crew afterward raised her board, when she sailed away. The time when this was done was not actually noted, but it was noted that she was sailing one minute forty seconds before the start, and she would even then have had time to reach the starting line but a few seconds, if any, late. It was not realized for some time on board the Glencairn that Constance did not intend to start, or until Glencairn was well on her way and Constance sailing up to the committee boat. The matter was then fully discussed as to whether we should go back and give up the race, but it was unanimously felt that nothing would induce Constance's crew to race in the light wind then prevailing, and that they had seized on a most trivial excuse to postpone the race beyond 3 o'clock, after which hour she would have had the right to demand a further postponement until next day, and that had we returned we would simply have consummated a result that they had strenuously worked for since the wind began to fall.

The commentators on the deed of gift have ignored the fact that during the first race on the preceding Friday, while the boats were in the race, and working to windward, Glencairn's board scraped for some distance over the sand shoal, and that when it was raised she had so far lost way as to refuse to come about, causing her to lose perhaps a minute by the accident. Again, in the preceding Monday's race, in working to windward off Pointe Claire, Glencairn struck very heavily, driving her centerboard almost home in the box, but as the breeze was strong she did not actually stop. Both of these races were lost by Glencairn, but no protest was entered, nor did Constance offer to give up the race.

I might also say that when racing at Oyster Bay, in 1896, Glencairn I. struck her board several times off Lloyd's Neck. Indeed, the incident of grounding when off the course is one for which the crew must always be held responsible.

The excuse has been made for Constance that she was racing in waters strange to her crew, and that the shoal was unknown to them. As a matter of fact, her skipper and most of her crew spent several weeks on Lake St. Louis prior to the races of 1897 and 1898, and they must have known the general character of the water. At all events the shoal in question was known to them, as they had touched it about half an hour before while the third course was being laid. After striking she came in the wind, apparently with the object of locating the shoal, and ordinary prudence must have prompted them to note its bearings.

The subject was discussed at length and it was finally decided to ignore the letter of the Seawanhaka race committee and to lay before the Seawanhaka Corinthian Y. C. that part of the report of the Royal St. Lawrence sailing committee dealing with the final race. The following resolution was adopted:

"Resolved, That the secretary be requested to forward a copy of that part of the report of the sailing committee referring to the international races for the Seawanhaka cup for 1899 to the proper officer of the Seawanhaka Club, informing him that a general meeting of this club has unanimously confirmed and adopted the same."

The question of the annual ball was then touched upon, and it was decided to leave the matter in the hands of the executive committee, to be held some time in January.

The meeting then adjourned.

Mahogany.

There are two woods which above all others are especially adapted for a great variety of uses about a vessel. For planking, waterways, bulwarks, rails, skylights and companions, bitts, gangway ladders and other deck work, and for interior joiner work and furniture, there is nothing the world over that can compare with mahogany and teak. While the latter has certain advantages of its own and is the more generally used in England and many foreign countries, the former is the favorite in America, both for ship and yacht work. Teak wood, or "Indian oak," is marked by the possession of a certain oil, which not only prevents it from checking and warping when exposed to the weather, as in deck work, but is a preservation of iron and steel when the wood is in contact with these metals, which makes it admirably adapted for the sheathing of the outer plating of steel and iron vessels, as well as for the covering of the metal deckhouses, bulwarks, etc. It has a rich color of its own (brown as compared to the red of mahogany), and it is a handsome wood for both deck and interior work. Up to 1880 it was practically unknown in American yacht building, but about that time it was imported from England for use in the early cutters, Bedouin, Wenonah and Oriva. Some of the teak thus used was procured from the yards of ships from the East Indies, Oregon or yellow pine spars being substituted for the teak ones while the vessels were in the port of New York.

There is an African teak, from Sierra Leone, but it is very hard and brittle, inferior to the India teak, from Burmah (India), and Java. The India teak is very extensively used in Europe for ship building and other uses. It is now used in this country on the large steam yachts in preference to mahogany, being imported direct from Burmah, or indirectly from England, but it is still expensive and difficult to obtain, the demand being limited.

Mahogany has been a common wood in America for two hundred years, the favorite material for furniture, from its appearance and lasting qualities. Being easily obtained from Central America and the West Indies, even in the days of sailing ships, it has been universally used in ship and yacht building for the deck and interior joiner work; but it has been little used for planking, the native woods, oak, pine and cedar, being so much cheaper. At the present time it is the favorite wood for the outer planking of all fine yachts. Though really inferior to teak for this purpose, it is much more easily obtained. We are indebted to the Boston Globe for the following interesting particulars of the mahogany trade of to-day:

Looking at grandmother's old mahogany bureau, that weighs 200lbs. and has lumber enough in it to build a whole parlor set of to-day, one is apt to think of the days when it was manufactured as the mahogany era—a time gone beyond recall.

While this thought is in a way justified, there is some fallacy in it, for inquiry into the mahogany trade shows that there never was a time in the world's history when more mahogany was used than now. It is being used differently, that is all, than in the days when grandmother's bureau left the cabinetmaker's shop.

Boston can claim, in the firm of George D. Emery, of Chelsea, the largest mahogany importing house in the world. In this firm's yards, at the end of Chelsea bridge, there are millions of feet of the finest mahogany in stock at all times.

Coming from the Nicaragua coast by steamer, in a type of craft specially designed and built for the trade, the lumber reaches Chelsea in the natural log. Here it is sawed into timber and boards, and is transshiped to all parts of the country, and to foreign countries as well.

The firm of George D. Emery—consisting of George D. and Herbert C. Emery—holds a concession from the Government of Nicaragua entitling it to the exclusive right to cut mahogany along the Atlantic coast of that country. It has hundreds of workmen in the forest along the rivers working on the lumber, and getting it to tidewater, where it may be taken aboard ship for Boston. Most of the logs are floated some 150 miles down river to the coast when the water is high.

The steamer Manchurian, a mammoth English-built craft, makes regular round trips for the firm to their base of supply in Nicaragua, and brings back fabulous cargoes of logs. On her last trip she arrived on May 23, 1899, with no less than 1,100,000ft. of mahogany in her capacious holds and on deck.

Representatives of the firm are constantly in the Nicaraguan forests looking after the selection and getting out of lumber. The natives in the country, Carib and Mosquito Indians and Nicaraguans, look to the great American firm as their patron and employer. Hundreds of colored laborers from the Bahama Islands are in the employ of the firm, both at river driving and cutting and handling timber. The Manchurian calls at Inagua nearly every trip to take out laborers from that and other islands. She is under charter for two years to the firm. A small steamer sent out from Boston is employed on Great River to tow rafts of logs and carry men and supplies up and down the stream. The men are boarded by the firm in camps. They earn about $30 a month.

When the Manchurian discharges cargo at Emery's wharf, at the end of Chelsea bridge, travelers across the bridge and the Chelsea ferry are treated to an interesting sight. The great steamer is so broad of beam as to be noticeable to the veriest landlubber. Her cargo brings her deep in the water, and the piles of great reddish logs on her deck indicate that she has a cargo of outlandish character.

Woods from the tropics have an attraction for the average mind. There is a suggested story of travel and adventure under the Southern cross, in the great ship and her rich cargo. A dreamer may make a delightful voyage to balmy Southern shores, even while leaning on the bridge rail and looking at the ship and its deck load.

But such a voyage is more pleasing in a dream than in reality. The crew of the Manchurian find her repeated trips to the Mosquito coast on the Caribbean rather monotonous. The English officers on the vessel, who describe themselves as being "under charter out here for two years," would prefer to be where they could see their families oftener. They don't see any romance in the coast where the green is perpetual, and is, as Daudet describes the South Sea Islands in "Port Tarascon," "a greasy and rheumatic green."

But thither the Manchurian goes once in thirty-five days, sometimes in ballast, at other times taking out cargo. She visits Great River and other points on the coast, enters and clears at the port of Bluefields, and then starts off for Chelsea, making about nine miles an hour. Arriving here she is tied up alongside a piling dock, that incloses a considerable expanse of water, and the work of discharging the cargo begins. It is easy, compared with what the getting aboard of these great logs, each weighing tons, must have been when they were hoisted from the rafts in Nicaraguan waters.

The process of discharging is most simple. The logs are hoisted to the rail, one end is pointed over the side, and a loose strap is placed under the other end. A donkey engine hoists the end of the log into the air, and presently the great trunk of a mountain giant slips out of the strap and goes splashing overboard into the mill pond.

From the pond the logs are hoisted out at the sawmill, and here they are cut into lumber of various sizes to suit the demands of trade.

Mahogany is to the American what the teak wood is to the Chinese. Everybody wants it. Parlor cars are finished in it; private houses are paneled and wainscoted with it; hotels, offices, drug stores and bars are finished in it. All furniture dealers carry heavy lines of goods made from it. Yachts are fitted with it in their cabins—it is everywhere, this wood of luxury—until the American public has what would seem to be a surfeit of it.

Where 1,000ft. of the woods were imported twenty-five years ago 1,000,000ft. are imported now. Where it was put to one use then it is put to a dozen now. A single parlor car requires 3,000ft. of mahogany in its finish, and 3,000ft. would make a good many bureaus, even as heavy as grandmother's.

In the old days the mahogany trade was not done on the regular timetable scale that it is now. Sailing ships brought the precious wood from the tropics, subject to wind and wave, and a regular supply could not be depended on.

To-day the world's markets are supplied through the agency of steam transportation from the bases where the concessionaires have the cutting and handling of the great trees down to a science.

So large is the business done in mahogany at the present time that more than one family in Boston burns mahogany kindling wood. This would seem to be a profligate way of keeping up a fire, but it is not. At the Emery mill there are so many slabs from the logs cut up that they are converted into kindling wood and the wood is sold to a company which vends it. The slab of mahogany, as of almost any tree, being largely sap, the lumber in it is not worth saving. And so it comes about that Boston is supplied with a considerable amount of mahogany kindling wood. The wood is a little more expensive than ordinary kindling wood, but it is so solid that it burns beautifully and makes a great deal of heat for the amount consumed.

While there is more mahogany used now than ever before, the character of the wood has changed. Formerly most of the world's mahogany came from Cuba and San Domingo, on the Island of Hayti. Before the ten years' war in Cuba, 1868-78, a tremendous export business in mahogany was done in the island. All the forests near water courses and roads were stripped of the largest trees, and the best mahogany the world ever saw was given to the market.

After the beginning of the ten years' war Cuba began to fall off in its supply of mahogany. The trees were no longer so easily available as before. The insurgents held the interior, the Spanish soldiery stuck to the towns, and in a short time a great business was killed. After the ten years' war the cutting of mahogany in Cuba was not resumed to any great extent, and what little was done came to end with the last insurrection.

Cuba still has immense amounts of mahogany in its mountain forests, but prospectors who went to the island last winter, immediately after Spain's relinquishment of sovereignty, found that it would cost more to get the timber to the seaboard, in the present condition of the island, than the profit on it in open market. Owing to the great weight of mahogany logs, they are best handled

by water transportation. That is not available in many parts of Cuba, and as there are practically no roads in the island at present, the growth will probably remain undisturbed in the forest until prosperity has led capital to invest in railroads to bring the lumber to the coast.

While Cuba has still a good store of mahogany, though hard to reach, San Domingo, once a most favored source of supply, has been exhausted. The timber cut there now is small and crooked, and not at all what is wanted in the trade, as it does not cut to advantage. The superiority of Cuban and San Domingo mahogany lies in the hardness of the wood, the beauty of its grain and its susceptibility to finish. Next to it in these qualities is the Nicaraguan wood, which comes in such great quantities to Boston. This wood is in such large logs that it cuts to advantage, and as it is a hard and close-grained wood it is quite as satisfactory for the demand of to-day as the Cuban wood was in the days of grandmother's bureau.

That there is danger of an exhaustion of the world's supply of mahogany does not seem probable. There are still millions of feet growing along the Mosquito coast that is ready for cutting. To preserve the supply in Nicaragua the firm of George D. Emery, sole concessionarie on the Atlantic coast of that country for as many miles into the interior as it cares to go, is obliged by the terms of its contract with the Nicaraguan Government to plant two trees for every one cut down. It is estimated that these trees will grow in fifty years to a marketable size.

Africa is a source of supply that to date has been little drawn upon to meet the growing demand for mahogany. It has millions of acres of mahogany forest that only until recently was practically untouched. Now the supply is being drawn upon, and in a short time African wood will be a strong factor in the market. It is not, so far as has been shown by the marketed product to date, as satisfactory a wood as the Nicaraguan. The best selections, however, have undoubtedly not been reached as yet, for the supply of the dark continent has only been tapped, not tested.

The world's supply of mahogany is carefully watched in the markets of England, where brokerage firms issue statements at intervals of a month or oftener, giving cargoes received at various ports, and the market price of the wood in London and Liverpool.

Recent quotations showed that while there was practically no Cuban wood to be had, and San Domingo wood was very scarce, Nicaraguan wood was third in the cost list. Cuban wood is quoted as high as from 7d. to 10d. a square foot of 1in. thick in the log. That is from 14 to 20 cents a foot. San Domingo was quoted from 8 to 13 cents, and Nicaraguan from 9 to 11 cents. By the time the latter wood is milled its cost to the buyer is from 16 to 20 cents a foot.

The brokers' lists of cargoes show that nearly every steamer sailing from Boston to England carries in her cargo consignments of mahogany logs sent from Boston to help supply the world's demand for the beautiful wood which the white man worships.

Bilge Keels on Power Launches.

A CORRESPONDENT asks for information as to the advantages of bilge keels on small power launches, upward of 45ft. long; whether they appreciably diminish the rolling, and whether they are detrimental to the speed.

YACHTING NEWS NOTES.

During the last few weeks work on the new club house of the New York Y. C. has progressed. After the foundation was laid there was a long delay owing to the contractors not being able to get the iron work, but as that was received it was soon set up and then the walls were erected. The workmen hurried because they wanted to get the building roofed before the fine weather breaks up. The building is now roofed in and men are at work on the interior. Some slight modifications have been made in the original plans, but only in the way of simplifying the arrangements and the decorations. It is expected that the new house will be finished early in the spring and will be formally opened before the next yachting season begins. It will be one of the handsomest in the club house district. It occupies three lots on West Forty-fourth street, and will be a fitting home for the largest yachting organization in the country. The models of Columbia and Shamrock have been placed in the model room of the present club house of the New York Y. C. and have attracted considerable attention. Columbia's model is hung over that of Shamrock and one can easily see the difference in the form of the two yachts.—New York Sun.

Capt. George Washington Comstock, one of the best known yachtsmen along the Atlantic coast, died suddenly at New London on Nov. 21 while hauling his favorite sloop out for the winter season. Capt. Comstock was sixty-nine years old, and spent the greater part of his life as a fisherman and yachtsman. He was the youngest of seven brothers who were born in the old Comstock homestead, New London. All of the boys took to the water in their early life, and "Wash," as he was familiarly called, like the rest, followed fishing when a young man. He became captain of a smack and later, as did his brothers, turned his attention to yachting. He was master of the schooner yacht Sylva for many years and later commanded a steam yacht. While in charge of the Sylva he contested with three of his brothers to see which yacht should be chosen to meet the Cambria, which came across the ocean in 1870 to battle for the America Cup. In that preparatory race, besides Capt. Comstock there were Capt. Peter, in the Phantom; Capt. Nelson, in the Columbia, and Capt. Andrew J. Comstock, in the Magic. The latter was selected as the defender. Quite a number of years ago Capt. Comstock gave up the water and branched out in the meat business. In October, 1894, he was chosen a member of the police, and has acted as patrolman and station house keeper, holding the latter position at the time of his death. Of the six brothers with whom he was brought up, only two, Andrew J. and Horace T., survive him. Of three sisters, only one, Mrs. Eliza Etsell, of Brooklyn, is living. Capt. Comstock is survived by his wife and two sons, George W. and Clarence. The captain was a member of Union Lodge No. 31, F. and A. M. Coincident with the sudden death of Capt. Comstock was the funeral of Capt. James Crandall, aged seventy-two, who was drowned in the harbor three weeks ago. His sloop was in collision with the British schooner Wanderian. Capt. Crandall's body was found near East Hampton last week and brought here for burial by steamer on Monday afternoon. He also was a skillful sailing master and had commanded yachts.—New York Sun.

Endymion, schr., built at Lonbey & Sons' yard for George Lord Day from designs by Tams & Lemoine, was launched on Nov. 18.

The schooner yacht Duen, Countess Schimmelmann, of Copenhagen, is at the Erie Basin, New York, where she will remain for some time, her owner doing mission work among the seamen of the port. Last winter was spent in Chicago in similar work.

A deed was filed on Nov. 17 by which J. Pierpont Morgan and Lewis Cass Ledyard transfer to the New York Y. C. the property on the north side of Forty-fourth street, 370ft. east of Sixth avenue, with plot 75 by 100.5 for a nominal consideration. The stamps attached to the deed show the value of the property to be $148,000. This is the property which Mr. Morgan presented to the yacht club several months ago as the site for a new club house, which is now in the course of construction.

A Few Stray Leaves from the Log of the Frankie.

BY THE COMMODORE.

We found the dam at the Hazard mill repaired and in good condition, as indeed all of the fish dams and mill dams along the river appear to be this year, the prolonged low water affording the needed opportunity. We usually shoot this dam without trouble, but to-day we found no available shoot, and were obliged to make a portage, which was easily done by shooting the canoes by hand over the old broken-down fish trap in the dam after they were lightened of our weight. We had expected to camp here at the Hazard mills, but on landing below the dam to prospect for an available camp site absolutely none was found—the sandy bank was densely overgrown with willows and weeds, and there was no water nearer than the mill, which is not on the river, but on the smaller arm to the left of the broad island which lies here; and as the mill was nearly half a mile away it was unanimously voted unavailable; so we reluctantly re-embarked and pushed on down, scanning the banks closely as we proceeded, hoping to discover a spring and room to camp near it. We had a troublesome time negotiating the rough, intricate falls, which extend for half a mile or more below the dam, and all had to disembark more than once before we succeeded in working through them.

Around the bend to the right, a couple of miles below, we sighted an old house not far from the river, and as it was rapidly growing dark, and we could at least get water here, we decided to land and make the best of it. Investigation developed a peculiarly unfavorable location, but a camp was finally made. Lacy's and the Doctor's canoes were carried up on top of the high bank, where they lay completely hidden from sight in the weeds and high stubble of an old wheat field; George's canoe was laid out on a little gravel spit projecting from a little gully in the bank, her stern lying up in the gully, while her bow dipped down into the water, the boat lying at such a steep angle that George had to dig his elbows and toes into her ribs all night to keep from fetching away bodily down into her extreme bow, while I made up my camp with my canoe afloat for the night, securely moored to the bank by her bow and stern painters.

The camp stove was buried in the weeds and stubble, and getting supper proved to be a matter of some little difficulty. To crown my discomfort, the wind chopped around after I had the fire made and the supper well under way, and I had the smoke and draft from the stovepipe squarely in my face. To cap the climax, just as I had finished the coffee and was reaching for it to set it off the stove, I managed to upset the lid off the coffeepot into the frying pan full of eggs, and to drop the dirty, greasy, smutty old rag I had been using all through the cruise to handle the hot cooking utensils with, into the pot of boiling coffee. With a volley of forceful and expressive language (quite unfit for publication, George says, but perhaps excusable under the circumstances), I kicked the coffee pot off the stove on one side, and the frying pan on the other. Lacy, who was beautifying himself for supper, retired behind his tent to laugh; the Doctor took a walk down the bank for the same purpose, while George stood his ground and hee-hawed like an infernal donkey until he could have been heard across the river. A fresh start was made, and supper finally accomplished by lantern light. The place was unanimously and not inappropriately named Camp Damnation.

I enjoyed the sensation of sleeping afloat last night, and a very peculiar one it was. After getting in there was a good deal of moving around to do, in getting things arranged for the night, and at every turn or motion the canoe rocked violently, and the same care was of course necessary to prevent a capsize that is required in running the boat. The close quarters and the rocking and swaying of my little canopy gave me a decidedly seasick sensation, and I felt quite qualmish until I was snugly and comfortably ensconced in my blankets, when the boat lay still enough; but all night, at every move or turn, the canoe would sway and rock from side to side. Take it all in all, the experiment was a success, and I quite enjoyed it.

After breakfast this morning a formidable looking, heavily bearded mountaineer, heavily armed and horribly reel-footed, accompanied by two or three big, strapping, well-armed boys and as many dogs, was observed bearing down on the camp. Consternation prevailed for a few moments, as we were not hunting for trouble; but we stood our ground, never having experienced anything but kindness and good-will from the natives on our several cruises before. The party on joining us proved to be both harmless and good- natured, for on my remarking that we had taken the liberty of squatting on his land over night and hoped he had no objections, he replied that he had none whatever, and that we were perfectly welcome. They were on squirrel hunting intent, and watched our packing and departure with great interest.

The muddy water barely reached us last night, and we passed out of it this morning in a couple of hours and into water of marvelous purity, such as we have rarely seen, even in this beautiful mountain river. The day's cruise was short—only ten miles to our camp at the mouth of Flint Creek, where we arrived at about 1:30. We waded up the soft, muddy creek to the spring in its right bank, about 50 yards above the river, where we took lunch, after which we went leisurely into camp and went a-fishing for the rest of the afternoon. The event of the day's cruise was the successful running of the vast expanse of reefs known as McCoy's Falls.

The river is extremely broad—nearly half a mile in places—and correspondingly shallow, and at such a low stage the water is so thin that the following of the boat channel is a matter of necessity, and even then the falls are hard enough to navigate. The channel goes in at the head of the falls, close up under the left bank, and is very plain for half a mile, when it veers out into the middle of the river and goes through a long, intricate series of reefs and small grassy islands in a long, narrow, rippling mill race of a canal about 100yds. long, after which it continues on down more or less closely to the right bank. We have heretofore always failed to hit just the place where it veers out, and have gone too far down and have gotten tangled hopelessly in the reefs, where all that could be done was to wade and lift and drag the canoes around, over and among the reefs until the channel was regained, when we have had the provoking experience of looking up that rippling little canal from below; and the last time we had that experience I vowed that next time I would run down that channel if I had to drag my canoe back up over the reefs and start over again; so this cruise, having previously taken my bearings and noted well the appearance of the reef—an interminable series of rocks and grassy islands, which seem to completely block the river—I paddled out carefully above it, and after a little search soon found the head of the canal, and we had the pleasure of dancing down over its rippling surface. We finally worked through the rest of the falls successfully, although at the expense of innumerable hang-ups for each and all of us in the shallow boat channels.

As we approached the old stone dam at the head of the short, steep rapid a mile below the falls, caution was necessary, and considerable reconnoitering was done by standing up in the canoes. The water was so pure and transparent that every pebble and grain of sand on the rough, rocky, uneven bottom—in 6 to 10ft. of water—was visible, and it made all of us curiously dizzy as we glided along so far above the ground, apparently suspended in air.

Investigation revealed the fact that care must be exercised here. The river pitched boisterously down a steep, rocky incline, about 100yds. in length, with an old stone dam at the head of the falls. George went down first to kodak the rest of us. He hung heavily on the old dam, and had to disembark in order to get off, but made the rest of the descent without special difficulty. I slipped over the dam successfully and made the run in safety at the expense of a few bumps from the rocks. Lacy got one or two heavy thumps before he reached the still water below, while the Doctor got down with his canoe right side up, but full of water, having nearly ripped the bottom out of her in coming over the dam. His canoe was baled out and he managed to keep her afloat till we reached our camp at Flint Creek, where, after lunch, she was inverted, when four or five long cuts were revealed all in a row, showing that she had had a tremendous rake from a sharp rock. Repairs were quickly and easily made after the canoe had thoroughly dried out in the sun.

As we approached a long series of reefs, half a mile above Bloomery, which seemed to extend clear across the river, we noticed a tall, Apollo-like darky, with as villainous a face as I ever saw, propelling a long, flat punt with the usual long pole, a little way ahead of us. He was a graceful cuss, and we couldn't help admiring his splendid physical proportions and the careless ease with which he sent his cumbersome craft over the water as he stood on the stern thwart wielding his long pole, albeit we voted that we would not care to meet him alone on a dark night if he thought we had the price of a drink about our persons. He gazed at us curiously and with interest as we approached. Not caring to go to the trouble of hunting out the boat channel, I inadvertently

asked him where it was, and suggested to him to go ahead and we would follow him through. He obligingly did so, but his opinion of us at once fell to 0. He told us that we would never live through Watson's Falls, two of three miles below, and we affected to make light of his warning, which he attributed to our ignorance. We finaly left him astern, and we heard him say to an ancient fisherman anchored in midstream in a boat close at hand, "Them fellers don't know no more about the river than nothin'." "That's all right," said George to Lacy and me, "but I noticed that he hung up twice in working through those reefs, while we didn't touch a rock."

While we were paddling leisurely through the broad, lake-like expanse of Newcomer's Eddy, we were hailed several times by men along the bank, fishing, road mending, etc., and warned that Watson's Falls at the foot of the eddy below were dangerous, and that we risked our lives in attempting to run them. We appreciated the kindliness that prompted these people to warn us—strangers to the river apparently—of the danger we seemed to be blindly drifting into, but assuring our friendly monitors that we were familiar with the river and had run the falls before we pushed on.

We found Watson's Falls not at all dangerous, for the reason that at this low stage of the water they were simply unnavigable. At this point the river runs over a massive limestone ledge, which forms a complete dam, and which extends with a sloping face of some 10 or 12ft. fall for a couple of hundred yards down stream. This face is worn into innumerable crevices and fissures by the water, and at the present stage the river simply resolved itself into hundreds of little brooks, which ran off down these fissures and crevices, uniting and reuniting into a wonderful lacework of brooks, rocks and islets. Innumerable bush-covered islands, large and small, dotted the surface of the ledge, and so filled the river bed that it was impossible to see very much of the falls from any one place.

We landed on the ledge at the head of the falls, near the right bank, and George and I waded and scrambled and climbed over the rocks and through the water and across the brooks and among the islands, until we were in sight of the foot of the falls, giving the river a careful inspection, and after picking out a practicable route we returned to the canoes. Near the foot of the falls a number of the channels unite in a full, bold stream, about the size of Middle River; this stream falls over a broken rocky part of the ledge in a heavy, rough fall, with such sharp twists and turns among the rocks below that it is unsafe to attempt to run it, so a portage was decided upon here.

On reaching the canoes we embarked and worked our way carefully down the falls, running down the little brooks wherever practicable, and where a passage could not be made, or where a canoe would stick, getting out into the water or on the rocks and working them over by hand until we finally lay bunched above the rough, impassable fall. This was portaged by George getting out on a rock in the fall, while Lacy and I swung the canoes out around him into the fall. As they swung past him one at a time he eased them down over the fall and into the proper channel up under the lee of the fall by means of the bow and stern painters. It was a ticklish piece of work, and two of the canoes were nearly swamped in the passage, and I held on to George's painter too long, and she careened against the rocks until her decks and hatches were awash before George got control of her, while Lacy, who was handling my canoe, thoughtlessly threw the stern painter into the water after swinging the canoe out into the falls, instead of tossing the end of it to George, waiting to receive it out on the rock in the falls. All that saved her from disastrously swamping was the fact that just as she was on the point of smashing up broadside on upon the rocks a length or more out of reach, the loose painter was washed across George's foot and around his ankle, and he snatched it up just in time to gain control of the canoe and avert an imminent disaster. The remaining 50 or 75yds. of the falls were easily run.

F. R. WEBB.

Prolonging an Old Boat's Life.

SOME time ago I cut from FOREST AND STREAM a receipt for patching canvas canoes, thinking it might come in handy at some future date. Later it occurred to me that the principle might be adapted to repairing wooden boats. I had a St. Lawrence River skiff that was badly cheeked and rotten in places, and I had about given up all idea of ever using it again; but on looking it over I decided to try the FOREST AND STREAM receipt, and now, after several months of use, I am in a position to say that the result has proved satisfactory.

The boat is of lapstreak construction, and many of the seams had opened. I went entirely over the boat, first closing the seams as much as possible by drawing together with clout nails. Next, where there were cracks through the 3-16in. planking I cleaned the painted surface, and where the paint had blistered I removed all paint by scraping. When the surface was in proper condition, I cut a strip of 8oz. duck of a length and width to cover the crack (generally 3/4in. was wide enough), and smeared one side by means of a stick with Lepage's liquid glue. The canvas was applied to the crack and pressed down, and the glue-stick drawn over the raveled ends, from the center outward, to make them adhere closely to the boat, and then the canvas and surrounding wood was brushed over with enamel paint.

The painting must be done before the glue sets, as the canvas is apt to warp otherwise.

Open cracks 1/8in. wide were covered in this manner, and also cracks at the butts of the strakes. After all the cracks were treated, I gave the boat two good coats of paint over all, and the result was a comparatively smooth surface, and one that was absolutely watertight.

Of course, an old boat repaired in this way will not stand any rough usage, and the patches are not proof against being dragged over rocks or even a sand beach, but by a little labor a boat that is practically worthless may be made serviceable for an indefinite time.

J. B. BURNHAM.

Rifle Range and Gallery.

Cincinnati Rifle Association.

CINCINNATI, O., Nov. 26.—The Cincinnati Rifle Association held its regular shoot to-day, at 200yds., off-hand, German ring target. Gindele was high on the king target with the score of 210. Trounstine was high on the honor target with a score of 66.

King score:

Fixtures.

Nov. 30.—Brooklyn, N. Y.—Thanksgiving Day shoot of the Brooklyn Gun Club. John Wright, Mgr.

Nov. 30.—Buffalo, N. Y.—Thanksgiving Day shoot of the Audubon Gun Club. Live birds and targets.

Nov. 30.—Newark, N. J.—Smith Brothers' grounds; 25 live birds, $10 entrance, and miss-and-outs.

Nov. 30.—Buffalo, N. Y.—Fourth annual Thanksgiving Day tournament of the Bison Gun Club. F. P. O'Leary, Prest.

Nov. 30.—Chicago, Ill.—Thanksgiving Day shoot of the Garfield Gun Club. Live birds. J. W. Meek, Sec'y.

Nov. 30.—Hutchinson's Mills, near White Horse, N. Y.—Thanksgiving Day shoot of Walsrode Gun Club. Geo. N. Thomas, Sec'y.

Dec. 5-6.—Rahway, N. J.—Live-bird shoot of the Rahway Gun Club. Clarence Lambert, Mgr.

Dec. 5-8.—St. Thomas, Ont.—Thomas Donley's third international tournament. About $1,500 guaranteed. Targets and live birds.

Dec. 12-15.—Burnside Crossing, Ill.—Watson's Park tournament. John Watson, Station R, Chicago, Ill.

Dec. 16.—Batavia, N. Y.—E C cup contest for championship at targets, between Messrs. W. R. Crosby, holder, and Fred Gilbert, challenger.

Dec. 19.—Dexter Park, Brooklyn, N. Y.—Open shoot of the Emerald Gun Club. Live birds. L. H. Schortemeier, Vice-Pres.

Dec. 31-Jan. 1.—Milwaukee, Wis.—Amateur tournament of the Wisconsin Gun Club. P. Himmelstein, Sec'y.

Brooklyn Gun Club.—Third Saturday of each month, Francotte gun contest. Fourth Saturday of each month, Grand American Handicap free-entry contest.

Watson's Park.—Burnside Crossing, Ill.—Medal contest the first and third Fridays of each month.

1900.

Jan 16.-19.—Hamilton, Ont., Can.—Annual tournament of the Hamilton Gun Club; $1,500 in prizes. Open to the world. H. Graham, Sec'y.

Jan. 17-18.—Danville, Ill.—Sconce-Cadwallader invitation shoot. Live birds and targets. John Parker, Mgr.

Feb. 13-17.—Hot Springs, Ark.—Third annual midwinter tournament; $1,000 added; 2-cent targets (Rose system) and live birds (high guns). Capt. A. R. Smith, Sec'y.

April 2.—New York Vicinity.—Interstate Association's Grand American Handicap. Edward Banks, Sec'y.

April 18-21.—Lincoln, Neb.—Third annual amateur tournament of the Lincoln Gun Club. Live birds and targets. W. S. Stein, Sec'y.

May 7.—Chicago, Ill.—Twenty-sixth annual convention and tournament of the Illinois State Sportsmen's Association. W. B. Leffingwell, Sec'y.

June 3-8.—Utica, N. Y.—Forty-second annual tournament of the New York State Association for the Protection of Fish and Game. Henry L. Gates, Sec'y.

June 5-7.—Columbus, O.—Ohio Trapshooters' League tournament. J. C. Porterfield, Sec'y.

June 11.—New York Vicinity.—Interstate Association's Grand American Handicap target tournament. Edward Banks, Sec'y.

Aug. 28-30.—Arnold's Park, Okoboji Lake, Ia.—Budd-Gilbert tournament.

DRIVERS AND TWISTERS.

In the absence of the Editor of this department all communications intended for publication should be addressed to the Forest and Stream Publishing Co.

Owing to a surplus of orders, the Savage Arms Company are now enlarging their works, having secured a ten-acre site on which new buildings are to be erected. They are quadrupling their power and machinery, and expect that the new factory will have a capacity of 30,000 rifles per year. They desire to announce to their customers that the delays which have arisen in filling orders are due solely to the lack of sufficient quantity of guns. They regret these delays, and assure the public that next year goods will be supplied promptly. For the enlarged business of the year the company states that FOREST AND STREAM is in a measure responsible, for, since they key all their advertising, they are able to know positively as to this.

When Mr. Abel Crook and Dr. Wynn, of Brooklyn, members of the well-known Fountain Gun Club, of that city, planned to take the members of the club and their friends to the monthly shoot at Dexter Park on Thursday of last week in the sumptuously fitted parlor car Columbia of the Brooklyn Rapid Transit Company, they evolved something new and startling. Lunch and trimmings were served en route, both going and coming, and a pleasant social shoot was also enoyed. While every member of the Fountain Gun Club is possessed of several gray hairs, many of them—and the two above-named in particular—also show traces of considerable gray matter.

Preparations for the Elliott-Doty matter at Lyndhurst, N. J., Saturday, Dec. 2, are all completed, and Tom Morfey has secured a stock of live birds. In the match, as well as in the sweepstakes shot before and after the race, he will provide the best birds obtainable, following up the precedent he has establishel for similar gatherings at his grounds. The easiest way to reach Lyndhurst is to take the train to Rutherford on the Erie R. R., and thence by car—seven minutes' ride to Morfey's grounds. Passengers coming by way of Newark can take the trolley at that city direct to Lyndhurst; it is about a short hour's ride from Newark by trolley.

The Audubon Gun Club, of Buffalo, N. Y., will hold an open shoot at Audubon Park on Thanksgiving Day. There will be live birds and target events, and also a match at live birds. After the shoot a Thanksgiving lunch will be served.

E. D. Fulford, of Utica, N. Y., was in the city the latter part of last week, and on Saturday afternoon took a trip out to Interstate Park in company with J. A. H. Dressel, secretary of the Interstate Park Association, with a view to looking over the grounds. In all probability the park association will install four full sets of Fulford's live-bird traps, as the same have given complete satisfaction wherever installed. The Riverton Gun Club, of Philadelphia, is about to take out one of its old sets and put in a set of Fulford's traps. This is a testimonial to the excellence of Mr. Fulford's inventions.

The recent victories of King's semi-smokeless powder are undoubtedly very gratifying to Tom Keller, the Eastern agent of the King Powder Company, through whose hustling ability this powder has become very popular among the rifle experts. The wonderful performance of M. Dorrler in the recent 100-shot championship match at Greenville, N. J., in which he scored 2,246 on the German ring-target at 200yds., broke the record that had been held for fifteen years, and L. P. Hansen at the same range scored 240 points, equally the best 10-shot score on record.

During the progress of the shooting at the New South Wales Gun Club's meeting last month the trapper drew a bird from the basket, and was just about to place it in the trap, when he noticed something unusual. On examination the bird was seen to have four legs. The supplementary ones were placed just behind the ordinary ones, and were joined together and attached to the body by a piece of gristle. Otherwise the bird was perfectly formed and evidently a strong flier. A suggestion was made that the club supply birds with four wings, and long ones at that.

Mr. L. H. Schortemeier, vice-president of the Emerald Gun Club, writes: "The Emerald Gun Club, of New York, having no regular club shoot during December, will hold an open shoot at Lebohner's Dexter Park on the club's regular monthly day, Tuesday, Dec. 19, beginning at 10 A. M. The day will be devoted to handicap sweeps and miss-and-outs at live birds. This will be an open shoot, and all shooters are welcome. Mr. Lebohner promises to supply a fine lot of birds.

The great Omaha-Kansas City intercity team race is now a thing of the past, and the Nebraskans have gone home with colors flying and bands playing. About two years ago Kansas City defeated the cream of Chicago's trap shots, and hope ran high within the breasts of the Kaw shooters that victory would again perch upon their banner, but it was not to be, for Parmelee's crack shots finished two birds ahead of their opponents. Such are the fortunes of war!

John Wright has chosen Tuesday, Dec. 12, as the date for the Brooklyn Gun Club's all-day shoot at Dexter Park. This will be a live-bird shoot, and the programme will consist of three events at 5, 7 and 10 birds respectively. If Mr. Wright doesn't have too many shooters, something that is liable to happen at his invitation gatherings, there will be miss-and-outs to follow as long as the daylight lasts.

Catalogue No. 12 of the Ideal Mfg. Co., which has just been received, contains new matter and supersedes all former lists. The improved tools appeal strongly to the specialist with rifle or shotgun. Copies of this catalogue will be sent free on application.

The Brooklyn Gun Club will hold a shoot on the club's grounds at Brooklyn on Thanksgiving Day. Shooting will begin promptly at 1 o'clock P. M.

Omaha—Kansas City.

KANSAS CITY, Nov. 25.—The intercity team contest between ten men from Omaha and a like number of local shooters was concluded here to-day, and resulted in a win for Omaha by two birds, the final score being Omaha 439, Kansas City 437, a percentage of 878 for the victors and 874 for the vanquished. The contest began Friday morning, and six men from each team shot their 50 birds on this day, and at its close Omaha had a decided advantage, being 11 birds in the lead and having won four of the six individual contests, tieing one and losing the other. While the local men got little glory out of the first day, they more than made up for it to-day, and though they did not succeed in winning the contest, they can get some satisfaction out of the knowledge of having won five of the ten contests and tied in another. This was brought about by their winning all four of the races to-day—that, too, from Omaha's strongest quartette.

The weather during the two days of the contest was cold and bleak, and not such as would be conducive to good birds. Nevertheless, those trapped during the shoot were as fine a lot, taken collectively, as one will see in many a day, and Elliott Brothers, who furnished them, are entitled to no little credit for their quality, while the Fulford traps that were used also added snap to them. Mr. John J. Hallowell was referee and Mr. Hugh Carnahan scorer.

The affair will be concluded with a banquet to-night.

First Day, Friday, Nov. 24.

PORTER—SCHROEDER.

This was the first pair selected to oppose each other in the intercity team race, and these inaugurated the contest at 10:35. Porter was the first up, it having been decided to have first a Kansas City man and then an Omaha man lead off. This contest was something of a surprise for the Kansas City men, as Porter is rated one of their very best shots, while on the other hand Schroeder is not looked upon as particularly strong, though of course he is a good shot. He is also somewhat handicapped by having only one finger on his left hand. Porter did not shoot up to expectations, especially at the finish, when he let down perceptibly. His first loss occurred on the 4th round, when he lost a circling incomer dead out of bounds, which was by no means a fast bird. His 8th, a rapid driver, was missed clean; the 20th, a direct left-quarterer, went over the boundary. The 25th, a wicked twisting outgoer, beat him. The 40th was a very similar bird, and it, too, got away. The loss of his 47th was a piece of hard luck. In the round he drew a bird that was caught in the trap, and though he killed it nicely after it got free it had to go as a no bird, and the substitute that he got was too fast for him. Poor head work lost him his 49th, for he permitted this bird to walk quite a distance from the trap without calling it, and thereby it gained an advantage that he could not overcome, especially as it went very fast after it started. He wound up by missing his last one. His score of 42 is not up to his average. He used his first barrel quite effectively, but when this failed to connect he was not very strong with his second. His best kills were his 13th, 14th, 16th, 21st, 24th, 29th and 37th. He also had 4 sitters in his lot.

Schroeder started in very raggedly, and for a time his first barrel was practically worthless, but he atoned for this in a great measure by sensational execution with the second. This made it appear that he was getting much the hardest birds, but such would not have been the case had he used his first with better effect. He had one bad streak during the early part of the race, as he lost 4 out of 5 from the 5th to the 19th round inclusive. None of these birds was hard, with the exception of the first, which had a peculiar carrying flight. After the loss of his 9th he ran 22 straight. Then he missed his 32d, a fast left-quarterer. His 42d was dead out, and his 47th got away clean.

Thus he finished with 43, and beat his strong opponent 1 bird. There is some glory in this. However, he had good luck, for his 37th was gathered against the wire. In this round he killed a bird that was caught in the trap, and this was the substitute. In this particular instance he outlucked his opponent, as he was not so fortunate when he had a similar bird. His best kills were his 4th, 13th, 18th, 32d, 33d and 37th. One sitter was all that fell to his lot.

The birds in this race were quite ordinary, taken as a whole, though there were some very fast ones among them. The weather was dark, cloudy and raw, and the wind, which chilled one through, blew directly to the shooter.

Porter shot a Rieley gun, Trap shells and Du Pont powder. Schroeder shot a Greener gun, Smokeless and Trap shells and Schultze powder.

BERESHEIM—ALLEN.

The second couple in the race was Gus Beresheim and W. S. Allen. This time it was the Omaha man's turn to lead off. Great things were expected from this pair, as each had a local reputation for excellent performance. In this respect no one was disappointed, excepting perhaps in the total; but it is often the case that big scores do not always signify good shooting, and this was largely the case here, for each of the principals gave a good account of himself, and made numerous marvelous kills. The character of the birds in this race was simply remarkable, and nothing equaling them has come under my observation since the Parmelee-Brewer match. Their vigor and activity was pleasing to behold, at least to the spectator, and the total of 43 that each of the principals put up was a most creditable piece of shooting. To enumerate all the good kills made would require a mention of nearly every bird scored, while to the credit of the contestants it can also be said that the lost birds were all very fast. This lot showed but a single sitter, Beresheim's 46th.

Beresheim had 3 dead of out bounds, and Allen 1. Allen's 12th, which is scored lost, he never shot at. On this occasion the shooter went to the score and called "Pull." A bird was liberated from No. 1 trap promptly, and flew directly to the shooter; the latter made no effort to shoot, and after the bird had flown away claimed a balk because the trap did not go all the way down. This the referee would not allow because the bird flew promptly and because the failure of the trap to open all the way had in no way interfered with the shooter, nor having obstructed his view, as the bird came toward him from the trap. This brought about a vigorous protest, but the decision stood, and the bird was recorded lost. At this juncture the Omaha men are still 1 in the lead.

Beresheim shot a Greener gun, Smokeless shells and Schultze powder. Allen shot a Parker gun, Smokeless shells and E C powder.

HICKMAN—BRUCKER.

The two above mentioned were the next called to put forth their efforts in their respective clubs' behalf. Hickman showed the best form, though he was weak on low-flying left-quartering outgoers. At one time in his second string of 25 he drew a bunch of this kind and lost 3 birds right together, though 2 of these were dead out of bounds. He lost 2 birds of an incoming tendency; but both these birds were very fast and also towered somewhat. Taking it altogether, his shooting was very good, as the birds were nearly on a par with those trapped in the previous contest. The only ordinary bird he lost was his last one. His best kills were his 26th, 28th, 36th and 43d. One sitter was all that he got. Brucker is one of the older class of shooters, and being somewhat advanced in years his sight is a trifle impaired. He states that it is difficult for him to locate a dark-colored bird promptly in such light as prevailed during this contest. Then he is also weak on incoming towerers, as half of his misses occurred on birds of this kind. Some of these were fast birds that came back rapidly. His 1st, 24th, 26th and 43d were outgoers of much activity. His 44th, however, was lost through carelessness and the failure to use his second barrel promptly. This bird was knocked down with the first, and the shooter supposed that it would be readily gathered, but such was not the case, and the bird succeeded in struggling out of bounds, which the second barrel would have readily prevented. This showed rather a lack of head work on the part of the shooter. His best kills were his 6th, 19th and 47th. One sitter is all he drew. His aggregate was 40, 2 birds short of his opponent's, so that to Hickman belongs the credit of putting Kansas City in the lead, as Omaha was 1 to the good at this stage of the race. The birds in this race were also a superb lot, though not uniformly so fast a lot. One of Hickman's losses was the hardest kind of luck. This was his 40th, which was stopped by an excellent second, but afterward struggled out when the boy went to retrieve it.

Both Hickman and Brucker shot Smith guns, Trap shells and Schultze powder.

READ—CURTICE.

When this pair got together the expected happened—that of pitting a man out of form against one who is shooting strongly, which invariably occurs in races of this nature, though of course it is difficult to say who this man will be. Unfortunately it devolved upon Curtice, whom the knowing ones would readily concede to be the better shot of the two. However, in this instance he displayed most irregular time, and also shot with little judgment, so that his opponent, who was right on edge and brimful of confidence, actualy ran away from him and beat him 6 birds. The plumber negotiated his first 24 birds in captivating style, and the Omaha men were correspondingly elated, for this was materially increasing their lead all the while. The run of 24 was the best up to this point in the match. His first miss occurred on the 25th bird, a very fast driver. In his second string of 25 he did not fare so well, as he lost 4. All his losses were good birds, with the exception of the last one, and this was an incomer. His best kills were his 18th, 20th, 32d, 33d and 38th, while he got but one sitter. His score of 45 was the best so far, and gave his team a decided advantage.

Curtice's shooting was very poor, as well as irregular, and it was evident by the time that he displayed that he was out of form. At times he would shoot quickly, and then again he would become methodical, while his misses occurred on all kinds of birds and at any time. He lost his first bird, which was a good one; but a little later on he bunched 3 misses together on very ordinary birds, and this is the style he showed all through the race. Omaha now has a lead of 6, 5 of which were secured in this race.

Read shot a Smith gun, Trap shells and Schultze powder. Curtice shot a Greener gun, Trap shells and Schultze powder.

COCKRILL—SMEAD.

This brace gave a good account of itself and put up a most interesting contest, which was only decided in favor of the Omaha man by Cockrill missing his last bird. The Kansas City man showed plenty of speed, for he actually scored his first 29 straight and then lost an incomer that was only an ordinary bird. His try next one got away also, but this was a fast one, and died out of bounds. His 34th was a similar bird, and brought about a like result. Then he lost his 41st, an incomer, also dead out; but this was poor shooting, and finally he let his last one deceive him, though this was not a hard one. His best kills were his 23d, 30th and 31st. Two sitters were his portion.

Smead showed good form, too, and was equal to most occasions, and though he made no great runs he succeeded by consistent shooting in landing his man. Excellent time and judgment accomplished this, so that it is only proper to add his form was good. His best kills were his 2d, 8th, 11th, 18th, 47th and 50th. However, he had four sitters, more than any other one man. The birds at this juncture had deteriorated considerably and were about on a par with those shot in the first race.

Smead's score of 46 is the best up to date, though the birds are in some measure responsible for this, as they were not nearly so active as in the three previous races. The outcome of this race adds one more to Omaha's lead, which is now 7. Smead shot a Greener gun, Trap shells and Schultze powder. Cockrill shot a Smith gun, Smokeless shells and Schultze powder.

Technically Smead really scored one more bird, as his 41st, which was lightly hit, lit in bounds, and the boy that went to retrieve it actually got hold of the bird, but let it get away, and it afterward flew out of bounds. According to strict interpretation of the rules, this was a dead bird.

BRAY—HERMAN.

C. C. Herman is looked upon as one of Kansas City's best pigeon shots, while there are plenty of Nebraska people who are willing to pin their faith to Dan Bray. When these shooters met every one looked for a capital competition; but here again they were disappointed, as Herman failed to make good, and was actually beaten 5 birds. Bray was about right, and put his loads in the proper place with seemingly little effort, so that at the finish he had the great aggregate of 47. The birds in this race were far superior to those of the preceding one, and it took quick, accurate work to negotiate many of them, so that this score of Bray's, which is the best of the day, was a very creditable piece of shooting. Bray's best kills were his 3d, 7th, 12th, 29th, 35th, 43d, 44th and 46th. He drew not a single sitter.

Herman shot poorly, and used equally bad head work, and the loss of his first bird must be attributed to this. The bird was a sitter, and he permitted it to walk 5 or 6yds. from the trap, so that when it started it had a very good chance to get away. When it took wing it proved a very fast one, and the shooter was unable to negotiate it. This he followed up by missing the very next one, an ordinary bird. He now pulled himself together and killed the next 19 in fine style; but after this he again seemed to lose his time, so that he lost 4 out of the next 6 birds. Three of these were dead out of bounds. One he should not have lost at all, for a man went to retrieve it and a dog got loose and chased it out of bounds, when apparently a cautious man would have gathered it. Had he claimed a balk the referee would very probably have allowed him another bird. He made one more run of 19 and then lost 2 out of his remaining 4. Incomers were evidently his Jonah birds, as he missed 3 of this kind. His best kills were his 11th, 12th, 46th and 48th.

Bray shot a Smith gun, Smokeless shells and Schultze powder. Herman shot a Smith gun, Trap shells and Schultze powder.

Second Day, Saturday, Nov. 25.

DAVE ELLIOTT—R. KIMBALL.

These were the shooters who resumed operations on Saturday morning, and as they are nearly equal in shooting skill a close contest was in order if each shot up to form. Elliott fulfilled expectations and put up a fast race. He was pitted against a most active lot of birds, and to show a total of 46 required fine kills on his part, which he was fully equal to. His first loss was on a very fast twisting bird, but his second one, an incomer, should have been stopped within bounds. The next one to escape was also a wicked one; but his final one, an outgoer, was an ordinary bird. The kills he made that merit mention were his 3d, 6th, 7th, 9th, 30th, 33d, 46th, 47th, and 48th.

R. Kimball lost his 2d and 3d birds, both of which should have been killed, as they were easy; but from this on he seemed to collect himself and shot a very mixed race, for though he lost 4 more birds, all of them were good, strong birds, while his 30th was probably the fastest trapped during the entire contest. He was very lucky in gathering his 24th, as this bird went far out and fell almost against the wire. This was an exceptionally fast bird. His deserving kills were his 12th, 13th, 24th, 26th, 29th, 34th, 37th and 41st. However, he had two sitters, while Elliott had none. By beating his opponent 2 birds, Dave Elliott reduced Omaha's big lead of 11 birds to 9. The birds in this race were very good, notwithstanding the bleak, raw and very cold day. This lot of birds was almost on a par with the Allen-Beresheim birds. Elliott shot a Winchester gun, Leader shells and Schultze powder. Kimball shot an Evans gun, Smokeless and Trap shells and Du Pont powder.

T. KIMBALL—STOCKWELL.

When this couple showed up it was surmised that Omaha would increase its lead somewhat, as Stockwell is a man of matured years and his eyesight is none too good, so that it was expected the bad light would have some effect on his shooting. On the other hand, Tom Kimball is one of Omaha's very best shots, and a man in the prime of life, so that his fellow members expected him to score 45 or better, and Stockwell was looked to for 43. However, the old man not only showed the best form and did the best shooting, but also used his head to better advantage. He made many fine kills and did great execution with his second barrel, so that it is impossible to enumerate all his good kills, as more than three-fourths of his birds were extra fast ones, and of the 5 he lost, all but one were good ones. Doubtless he surprised himself—and every one else—by beating his strong opponent 4 birds, and thereby cut down Omaha's lead to 5.

Tom Kimball's showing was the disappointment of the Omaha contingent. He gave a good account of himself in the first 25, but in the final string he lost his time and his head. Once he forgot himself to such an extent as to accept a bird when two were liberated from the same trap; but after shooting once and missing he permitted the birds to fly out of bounds without shooting his second barrel. Of course, this bird had to be scored lost. In the second string he lost 6 birds out of his first 12. Regardless of the fact that he shot raggedly, he made some fine kills, among which were his 2d, 11th, 21st, 31st, 39th, 45th, 48th and 50th. There was not a single sitter in this lot of birds.

Stockwell shot a Greener gun, Trap shells and Schultze powder. Kimball shot a Grant gun, Smokeless shells and Du Pont powder.

CAMPBELL—CRABILL.

Each team had been reserving its strong men for the finish, and now Campbell and Crabill were to try conclusions. The Kansas City man was not expected to show up very strongly, as he had been confined to bed by illness for several days previous. Nevertheless, he demonstrated that he possessed marked ability, and his friends' confidence in him had not been misplaced, as he beat his man, one of Omaha's best, by 1 bird. Four of his six misses were the result of hard birds, while one, his 41st, an incomer, was dead out. His 23d was lost by his gun failing to work. He also scored many good kills, of which his 5th, 10th, 16th, 19th and 29th deserve special mention.

Crabill got a running start, as he killed his first 19 straight, after which he got in a rut and lost 5 out of 12. He followed this up with another run of 15, and then lost 2 together, so that he finished with 43, which left Omaha 4 in the lead and one more race to be decided. The majority of Crabill's misses occurred on good birds. He also killed his share of fast ones, and his total is very good for such a fast lot of birds. His star kills were his 5th, 21st, 22d, 35th, 39th and 46th.

Campbell shot a Winchester gun, Smokeless shells and E C powder. Crabill shot a Greener gun, Trap shells and Schultze powder.

PARMELEE—GOTTLIEB.

As a final, this brace was put on, and as each is conceded to be the strongest representative of their respective teams, as well as the pride of his city, this was of course the race in which the most interest centered. Then, too, it was the Kaw town shooters' only hope, for if their man would put up a great score and his opponent showed ragged form it was yet possible for them to overcome the Omaha lead of 4. Kansas City's man did not succeed in winning the race for his team, for this was impossible in view of the score his opponent shot; and had he not lost that one duffer and finished with a clean score, his team would still have been 1 bird short. However, he got all the glory possible, as he outshot his man from every point of view, and also made the longest run and the highest score of the entire shoot. It is questionable if he ever showed such form, and though I have seen him shoot many times I cannot recall an instance when he approached his shooting of to-day, for it is rarely one sees such good birds trapped.

Throughout the entire race his precision and judgment was great, his only miss occurring on a little hoverer, that dropped out of the load, and which was the poorest bird of the entire lot; but this one fooled him, as above mentioned. The best kills he scored were his 2d, 4th, 7th, 8th, 17th, 22d, 26th, 27th, 33d, 34th, 35th and 36th. His only loss occurred in the 12th round, and thus he finished with a run of 38 straight.

Parmelee shot his usual good race, and maintained his reputation as a shooter of marked ability, and his score is an excellent one, owing to the fact that he was using a strange gun, having had the misfortune to break his regular pigeon gun a day or so previous. He was quite lucky in several instances, as he got 5 birds that flew almost to the wire before they succumbed. Every one of them was a good strong bird and was hard hit, and in nearly every case they were stone dead when they stopped. Incomers troubled him most, as two of his misses were the result of such birds. His good kills were his 8th, 12th, 29th, 34th, 41st and 49th.

Both shooters used Smith guns, Trap shells and Schultze powder.

PAUL R. LITZKE.

St. Louis Doings.

ST. LOUIS, Nov. 21.—John J. Sumpter and J. L. Crawford shot a match for the Busch medal to-day at Dupont Park, and this resulted in an easy win for Sumpter, as every one expected it would, for Crawford is virtually a novice at match shooting, and of course has little chance to beat such an old seasoned pigeon shooter as Sumpter. However, he showed some ability to-day, as the birds were very good, and there was a good wind. While he scored but 19, he had 3 birds dead out of bounds.

Sumpter finished with 22 and 1 dead out of bonds.

This makes Sumpter's third win of the medal. The score:

```
Sumpter .....222222222*222022022222222—22
Crawford .....0*2022222222*02222*222222—19
```

Keystone Shooting League.

PHILADELPHIA, Pa., Nov. 25.—The regular club shoot of the Keystone Shooting League was held to-day. A combination of fast birds and strong wind made good scores hard to make. Eames again won the shoot for the Keystone challenge cup, which is his second win in this series. The race now stands: Eames 2, Vandergrift 2, Henry 1. Event No. 2 was the regular weekly club shoot. Vandergrift won with a clean score from a field of twelve shooters.

On Thanksgiving Day the club will hold a 15-bird open sweep, $7.50 entrance, Rose system, to divide purse.

The scores made for the championship cup follow:

Keystone championship cup, 10 live birds, 30yds. rise: Eames 10, Gerkle 10, Henry 9, Vandergrift 9, Foster 9, Johnson 8, Fitzgerald 7, Felix 7, Van Loon 7.

Shoot-off: Eames 3, Gerkle 0.

Club shoot, 10 live birds, handicap rise: Vandergrift 10, Henry 9, Fitzgerald 9, Landis 8, Foster 8, Van Loon 8, Johnson 8, Gerkle 8, Stevenson 7, Eames 7, Felix 7, McFalls 7.

Clearview Gun Club.

PHILADELPHIA, Pa., Nov. 25.—The monthly shoot of the Clearview Gun Club was held to-day. The main event was the shoot for the Fisher cup at 25 targets, handicap, unknown angles. Scores:

Fisher, scratch, 24; Urian, scratch, 22; Elwell, 5yds., 22; Downs, 1yd., 20; Simon, 4yds., 17; Edwards, scratch, 15: Johnson, scratch, 15; Hassan, 2yds., 13; Hill, 2yds., 10; Oliver, 2yds., 10; Stevens, scratch, 9; Carr, 4yds., 7; McConnell, 6yds., 8.

ON LONG ISLAND.

Fountain Gun Club.

Nov. 23.—The Fountain Gun Club, about the oldest organization of the kind that has any life in it, held a most enjoyable shoot this afternoon at Dexter Park, L. I. It was a purely social affair, the almighty dollar cutting no figure in the events shot off.

Invitations were issued to some lucky individuals asking them to join the members of the club at the corner of Flatbush avenue and Fulton street, Brooklyn, at 12:30 prompt. At that point the club had the parlor car Columbia, of the Brooklyn Rapid Transit Company, in waiting, ready to convey the passengers—club members and their guests—to the grounds over the rails of the surface car company. While in transit, lunch was served on the car in true dining car style; nothing was lacking; it was just great.

The shoot was not playing second fiddle to the lunch by any means. There were twenty-one entries in the club event, 10 birds per man, each man to pay for his own birds, and to make his own handicap. In the 5-bird event which followed the club shoot a few put up $2 as a sweep, and a dark horse or two annexed the pot.

At 4:15 P. M. the special car called for the crowd, the Brooklynites escorting the New York city contingent over the Brooklyn Bridge to the New York terminus, where, it being the height of the rush hour for home, the car and its contents attracted considerable interest from the crowd that was struggling for a foothold on the outgoing cars.

One feature of the trip home was the holding of a club meeting at which Col. Sloane, Capt. Money, Jacob Pentz, W. L. Gardiner, Edward Banks, etc., were elected members of the organization.

The credit of all the enjoyable features of the day must be given to Mr. Abel Crook, for a long time president of the club, and to Dr. W. Wynn, one of the oldest and best live-bird shots in and around New York city.

Scores were as follows:

Capt Money, 31	1122212221—10	Adams, 29	2111022201— 8
Banks, 30	2222220121— 9	Gardiner, 29	1110220211— 8
Wynn, 30	1101111111— 9	Van Wicklen, 28	0211102011— 7
Allen, 28	2212012222— 9	Hunter, 28	2001102110— 6
Eddy, 28	2112111011— 9	Brixey, 29	1000210111— 6

Oceanic Rod and Gun Club.

Nov. 27.—Following are scores of the Oceanic Rod and Gun Club's shoot, held to-day at Rockaway Park. In the team race between the Fulton Gun Club and the Oceanics, seven-men teams, 25 targets per man, the home team won by a good margin. The return match will be shot on Dec. 11, on the grounds of the Fulton Gun Club. Scores:

Oceanic—Schorty 22, Dudley 22, Schubel 21, Jones 18, Diffley 13, Coleman 11, Owen 10—117.

Fulton—Schneider 18, Blake 17, W. Woods 16, Schoverling 13, Martens 6, A. Woods 6, Belts 5—81.

The following events were also shot:

Brooklyn Gun Club.

Brooklyn, Nov. 25.—Regardless of high winds, a dozen or more of our members put in an appearance at our club grounds this afternoon to participate in the afternoon's sport, it being the fifth monthly shoot for the free entry to the G. A. H. of 1900.

In event No. 5 a special prize, a handsome leather gun case, was offered, and after a lively struggle the prize was won by Wm. Hopkins, of Aqueduct, L. I., the champion bluerock smasher of the club. The scores follow:

Fifth shoot for free entry in G. A. H., 1900:

Sweep, 5 birds: Sands 5, O'Donoghue 4, Wallace 4, Stillman 4, Creamer 4, Kemble 4, Lincoln 4, Pillion 4, O'Connell 3, Short 3, Amend 3, Dressel 1, Mohrmann 1.

Crescent Athletic Club.

Brooklyn, N. Y., Nov. 25.—The final shoot for the November cup was held to-day on the club's grounds, at Bay Ridge. Kenyon won to-day's race, making a 25 score with the aid of his liberal handicap. W. W. Marshall with a handicap of 6 wins the cup with a score of 68. Banks, the scratch man, is second with 67; H. L. Kenyon, 10, and Henry Kryn, 3, are tied for third place with 66; L. Rhett, 5, is next with 63, and John Hallock, 3, follows with 62. The conditions of the event are that a member must take part in at least three weekly shoots in order to become eligible for the cup, and by taking part in more than three shoots in a month he has the privilege of counting his three best scores. Ties in the prize shoot, at 15 singles and 5 pairs, will be shot off next Saturday. The scores:

Kenyon, 10	1011111101101111000111100111010111	—25
Rhett, 5	1101011010011111110011111111101	—22
Marshall, 6	0011101111011111001111011011110	—22
Notman, 4	0111111111000111011101101101	—21
Banks, 0	1011100111011111110111111	—20
Kryn, 3	1011101111010110011111011000	—18
Hallock, 3	1110011100101111001100111101	—18
Rasmus, 8	1001100011011001100011101001010 01	—16

Prize shoot, 10 pairs: Harrison, 1, 15; Banks, 0, 14; Kryn, 2, 14; Kenyon, 4, 14; Hallock, 3, 13; Rhett, 3, 13; Marshall, 5, 12; Notman, 2, 12; Adams, 1, 10; Chapman, 5, 7; Hagedorn, 2, 6; Wyckoff, 4, 10.

Prize shoot, 15 singles, 5 pairs: Banks 19, Hagedorn 19, Rhett 19, Wyckoff 19, Notman 18, Kryn 17, Hallock 17, Harrison 16, Kenyon 15, Chapman 9, Bretton 9.

IN NEW JERSEY.

East Side Gun Club

Newark, N. J., Nov. 23.—The East Side Gun Club held its regular club shoot on Smith Brothers' grounds to-day. The birds were a mixed lot, some fairly good, but none very fast. Five men made clean scores, of whom three were in Class A. The club shoot was at 10 live birds, optional sweep, three moneys, Rose system. Following the club shoot were three sweeps, each at 5 live birds. The scores:

Club shoot:

Herrington, A, 29	1211221212—10	P O N, A, 29	*210122122— 8
Hassinger, A, 29	2112122211—10	Ferguson, B, 27	0210220212— 7
Sinnock, A, 29	2112112111—10	Koegel, A, 29	0100212221— 7

No. 3, same: Hassinger 5, Leuthauser 5, Sinnock 5, Schorty 4, Davis 4, P. O. N. 5.

WESTERN TRAPS.

The Holiday Season.

Nov. 25.—Nothing much is doing in trap matters in this city the present fall outside of the regular club shoots and the open trophy contests, whose scores are regularly reported in these columns. The Eureka Gun Club comes into the live-bird field next Saturday, shooting every other week on Saturdays, and hence following each contest of the Chicago sportsmen's trophy series. Garfield Gun Club shoots to-day, as see scores in another column, and they are having pretty good live-bird weather this afternoon.

The two main holiday events of the season will be the Thanksgiving shoot of the Illinois Gun Club, at Springfield, next week, and the regular winter tournament of John Watson, which will come just before Christmas, beginning Dec. 23 and lasting till the boys are broke. John Watson will of course get together a warm shooting crowd, and this will stir things up a little bit here. The Illinois Gun Club shoot next week will be a pretty swell affair, with Governors, Archdukes, etc., mixed up in it. There will be a good Chicago attendance, and this will be the leading Western affair of the week.

Chicago has not been a storm center for some time in the trap-shooting world. We have settled down into a sort of jog-trot which has no great interest for any one so far as trap news is concerned. So far as I know, we have no match shooters left anywhere in the West—that is to say, men who will come out and shoot for their own money. You may be able to get a pigeon match with the employee of some gun or powder house, but nowadays the Simon-pure is hard to pick up for pigeon purposes.

I was talking to Dr. Carver this morning, and the latter tells me that as his business season is now over he is going to load up some shells and see if he can shoot a few pigeons down at Watson's. He would like to entertain any one ambitious enough to shoot a series of live-bird races, each day for a week or so if necessary. I wish somebody would come along and stir things up, for Chicago is a dead one this fall in pigeon matters. We want to see a nice 100-bird race, shot in a good wind storm, between two good ones. If something of that kind does not happen before long we are apt to go utterly to sleep.

E. Hough.

480 Caxton Building, Chicago, Ill.

Garfield Gun Club.

Chicago, Ill., Nov. 25.—There was a large attendance at the Garfield Gun Club's shoot to-day, twenty-five members and two visitors shooting in the trophy event. The visitors were Mr. D. L. Cramer, a member of the Arkansas State Gun Club, of Stepguard, Ark., who is now a resident of Chicago, and Mr. S. M. Savage, of this city, who just came out for a little excitement. Several ladies were also present. There was a mean wind blowing, which carried the birds toward the score. The birds were as a rule very lively and very good flyers. The sweepstake could not be shot out, for lack of birds. The scores:

Elliott—Doty for Republic Cup.

We have received from Mr. J. A. R. Elliott a check for $50, to cover forfeit of Mr. Aaron Doty in his challenge of Mr. Elliott to contest for the Republic cup. As reported in these columns last week, Mr. Elliott has named Thomas Morfey's grounds at Lyndhurst, N. J., and to-day, Dec. 2, at 1 P. M., as the place and time of the match.

Blauvelt's Invitation Shoot.

Ridgewood, N. J., Nov. 22.—The invitation shoot given by Mr. H. H. Blauvelt, of the Brooklyn Gun Club, was held on the baseball grounds, near the Rouclere House, to-day. The day was not propitious for a shoot, the weather being dull and cloudy, with no wind and occasionally some rain. There was a good attendance of spectators, but shooters were not as numerous as had been hoped for. The birds were a mixed lot, occasionally bringing forth a good one, while several were very good. There were three events on the programme. No. 1, at 5 birds, $3 entry, birds extra, 28yds. rise; No. 2, at 7 birds, $5 entry, birds included, handicap rise; No. 3, 10 birds, $10 entry, bird included, handicap rise. All purses divided; three moneys in Nos. 1 and 2, four moneys in No. 3. In addition to the programme events an extra sweep at 4 birds was shot. Following the sweep was a match at 25 birds between T. O. Wright and P. O. N. This was shot late in the afternoon, and it was quite dark when the race was finished. Wright grassed all his birds, while his opponent missed two fast ones, which lost him the match. Scores:

Audubon Gun Club.

Buffalo, N. Y., Nov. 25.—The attraction at to-day's shoot of the Audubon Gun Club was the Clinton Bidwell challenge trophy event, at 25 live birds per man. There were eighteen entries, but not a straight score was made. George Cooper won with 24 kills. H. D. Kirkover and C. S. Burkhardt were second with 23 each. The final shoot for the cup will be held on May 30, 1900, at 50 birds per man. All those who have one or more wins to their credit may compete.

Two target events were also shot to-day. E. C. Burkhardt and H. D. Kirkover tied for first place in each. In the club badge shoot they scored 29 out of 25 for the Class A badge, Jacobs winning Class B badge with 19.

There will be an open shoot here on Thanksgiving Day, at live birds and targets, and a live-bird match will also be shot.

Scores in the Clinton Bidwell Trophy event:

Cooper, 28	1021122211121121211211222—24

Sconce-Cadwallader Invitation Shoot.

Sidell, Ill., Nov. 21.—*Editor Forest and Stream:* On Jan. 17-18, 1900, at Danville, Ill., an invitation shoot will be given by Mr. H. W. Cadwallader and myself. The first day will be given to target shooting. Targets at 2 cents. There will be twelve events, six at 15 targets and six at 20 targets. On the 18th will be shot the Sconce-Cadwallader live-bird handicap at 25 live pigeons, $25 entrance, handicap distance 26 to 31yds. Handicapping to be done by Uncle John Watson, of Chicago.

We are going to give this shoot as near cost as possible. Our object is to get our sportsman friends to come to Danville and get better acquainted. Therefore the pigeons will cost but 15 cents each. This puts 10 cents of the price of each pigeon in the purse, according to all other shoots, where the price is 25 cents per bird, and in the handicap will make about $100 more money in the purse than if 25 cents were charged. As you can see, this is no money-making affair, with targets at 2 cents and pigeons at 15 cents, but a nice, social shoot, with a chance to break even.

There will be about 100 invitations issued, and an answer must come from every one invited, "yes" or "no," as we want to know whether we will have an attendance large enough to insure success. When we have received all the replies we will notify those invited how many entries we have received or promises, and if we have enough to make a good shoot will then require a $10 forfeit and the other $15 on Jan. 18. By this plan every shooter who comes will know that he will have plenty of company and a grand time. Jack Parker, of Detroit, Mich., the veteran tournament manager, will manage this shoot, and everybody knows that it will be run up to date. All mail to be addressed to Sidell, Ill.

H. J. Sconce.

Answers to Correspondents

No notice taken of anonymous communications.

W. L. H., Fayetteville, N. C.—Will you be so kind as to give me some idea of the crappie? I made application to U. S. Fish Commission for bass and could not get them this season, but was offered the crappie in place of bass. I am anxious to know something of this fish, and to know if they are game and good for food—size, etc. How about buying small-mouth black bass? Can you tell me where to get them? Ans. The croppies, or crappies, are esteemed as game fish. There are two varieties, the small-mouth and the big-mouth. While not so game as the black bass, they give good sport, and are excellent for the table. See notes on them and illustrations in our issue of Junes 25 and July 2, 1898. We do not know where black bass fry can be had.

PUBLISHERS' DEPARTMENT.

The Big Four Route.

The popular line from Chicago to Indianapolis, Cincinnati, Louisville and all points South and Southeast. The scenic line to Washington, D. C., and Hot Springs, Va., via Chesapeake & Ohio Ry. The direct line to Asheville, N. C., and Florida points. J. C. Tucker, G. N. A., 234 Clark St., Chicago.—*Adv.*

There is perhaps no keener suffering than that of rheumatism or gout; and rheumatism is far too common among anglers and gunners, who are so often subject to exposure in the field. Those who suffer in this way are advised to try Simon's rheumatism remedy, advertised in another column, which promises speedy relief.—*Adv.*

The pictures sent out by the Northwestern Hide and Fur Co., as advertised elsewhere, are now sent out rolled instead of flat, so as to guard against breakage.—*Adv.*

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1899, BY FOREST AND STREAM PUBLISHING CO.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, SATURDAY, DECEMBER 9, 1899.

VOL. LIII.—No. 24. No. 346 BROADWAY, NEW YORK

FOR 1900.

FOR 1900, the concluding year of the nineteenth century, the FOREST AND STREAM, in the abundance, variety and high grade of its subject matter, will maintain the standard of its past and present. The weekly instalments of good reading in one of the most attractive fields of current literature have long given the journal a secure place in the favor of a very wide and valued constituency. In this close feeling of interest and regard entertained for it by its subscribers, the FOREST AND STREAM is unique; we question if another paper is published which enjoys in fuller measure such intimacy of feeling. For one thing the journal is what its contributors make it; for while in editorial conduct it aims to be always in the lead, pointing the way and encouraging constantly toward the attainment of a higher standard in all that concerns the sportsman's interests, it is none the less the purpose to reflect the sentiment and feeling and to stand for the defense of the principles of the clientele it represents. In so far as it does this, the FOREST AND STREAM seeks the support and co-operation of its friends. No journal, we are assured, can be more acceptable to the man of rod and gun nor hold a closer place in his regard than that one of which he himself helps in the making.

It is not all of fishing to fish, nor all of shooting to shoot. There is something more in each. In 1900, as heretofore, the FOREST AND STREAM will give not only the shooting and the fishing, but the something more.

FAWNS.

SOME question exists in the North Woods, we are told, respecting the meaning of the term "fawn" as employed in the prohibition which reads that "no fawns shall be caught or killed at any time." In a number of States fawns are protected only while in the spotted coat; and some of the Adirondack hunters construe the term fawn as meaning the young only while it shows the spots. As the fawn born in the spring loses its spots in the autumn, when it assumes its cold-weather coat, when only a few months old, it is clear that the term of fawnhood extends far beyond the spotted coat stage. Without regard to spots, a fawn is a fawn until it becomes a yearling, just as a domestic calf is a calf until a year old. The deer in the fawn stage of the first year is protected simply because of its weakness and innocence of the perils which surround it. The legal code and the hunters' code undertake to protect it while it does not know enough to protect itself; and the period of a full year is all too brief for this immunity.

If there are men in the Adirondacks who want to kill deer in the fawn age and who take advantage of the present wording of the law, it would be well to make the statute more explicit by embodying in it the age limit of a year.

THE HEMPSTEAD DEER CHASERS.

THE Meadow Brook Hunt Club, of Hempstead, Long Island, indulged in a deer hunt Thanksgiving Day, a report of which is given in another column. The deer was one which had been captured and held in confinement pending the meet. It was turned loose in a field, and not having the sense to run away was lashed with a whip to give it a start, and eventually jumping the fence of the inclosure made away across country, followed by a pack of twenty-five hounds and the mounted huntsmen. It was chased for five miles and then took refuge in a barn. The dogs followed after it into the barn, but the grooms in attendance got there in time to save its life. The whole performance smacked strongly of the carted-stag hunt of Great Britain, in which a tame deer is carried in a cart to the hunting ground and there put out and started off for huntsmen and hounds to chase about the country. The form of sport is one which may do for Great Britain, but does not belong here; as Mrs. Harrison once said at a White House reception: "Many things are done in Washington which don't go on the Wabash." However much the chase of a tame deer may be enjoyed by those who participate in it, the practice is regarded with disgust by most sensible people. But quite apart from any consideration of the Hempstead hunt as a legitimate or illegitimate form of sport, the fact is pertinent that those who took part in this Thanksgiving deer chase acted in clear violation of the game laws. It was illegal to hunt deer on Long Island in any way whatever at that time. This chasing of a buck with a pack of hounds was just as much hunting as to chase a buck with hounds in the Adirondacks. For the offense the Hempstead hunters should promptly be prosecuted; and we trust that Game Protector Pond will not permit any delay in the matter. The time to move is now, when the occurrence is fresh in the public mind; and the Hempstead hunters should be brought up with a round turn.

THE NEW YORK FISH COMMISSION.

IT is familiar history that the constitution of the New York Fisheries, Game and Forest Commission as a board of five members was a political creation, and that its president was given his place as a political job. Governor Roosevelt is reported to favor the substitution of a single-headed Commission in place of the present board of five. While it might be possible to find one man who could do the work of the five if he gave his entire time to it, we believe that a wiser plan would be to separate the several divisions which are not of necessity combined and to provide for each branch a single head who should have the control of that particular work and the responsibility for the way in which it was done or left undone. The forestry, the game and the fish protection, the fishculture and the oyster farming are four distinct interests, which should be in charge of four individual directors. There is no more reason for combining them in a joint commission than there would be for uniting the excise, the banking and the public works boards. The survey of an oyster plot in Long Island Sound has no reasonable connection with the task of running down the deer hounders in Essex county, and the administration of the forests has no logical connection with the conduct of the Caledonia trout hatcheries. Give each distinct department to a commissioner fitted to conduct it, and let him do his work unhampered by the diverse interests of the other departments. Exercise care that the man chosen for the responsible place shall be one who by education, training and attainment in this special field is fitted to do the work intelligently and efficiently. Let us have no longer the spectacle of a politician holding a place at the head of a commission as a reward for political services and enjoying his place as "something equally as good." In short, conduct the fisheries, game and forests business in a business way.

TO MAKE IT A CRIME.

THE numerous mortalities and casualties to human beings resulting from the shooting of men by hunters who mistake their fellows for game have prompted a movement in several States to take cognizance of the careless shooting in legal enactments providing punishment for it. For example, in New York a proposed addition to the penal code reads:

"Section 1. It shall be unlawful for any hunter, or other person carrying firearms, to shoot at any object without knowing by actual sight and observation that such object is not a human being, and any such hunter or other person who, by so offending, shall kill any human being, shall be adjudged guilty of manslaughter in the second degree; and any such hunter or person who, by so offending, shall wound or injure any human being, without thereby causing death, shall be adjudged guilty of an assault in the second degree.

"Sec. 2. It shall be the duty of the Forest Commission to post notices reciting the provisions of this act, in the same form and manner and in like places as notices for the prevention of forest fires are now posted by said Commission."

Such killings as are here concerned would appear to come legitimately under the definition of manslaughter even as the law now stands; but to incorporate in the statute some such specific provision respecting these particular acts would doubtless emphasize the criminal aspect of the deed, and the effect could not but be salutary. As we have often pointed out, the knowledge that it is a crime to shoot at an object without knowing that the thing aimed at is not a human being, and the consciousness that one violating the rule incurs a penalty for this criminal act, must exert a constantly restraining influence. The thing to be attained here is restraint; the necessity is for caution and precaution which shall prevent the act, not for an added penalty after the deed has been done and the perpetrator has punished himself with the remorse which follows. If we had such a law and the warning notices containing it were posted where they could not fail to impress themselves upon every hunter who goes into the woods, the list of hunting "accidents" would certainly be lessened.

GAME ON THE FARM.

A MASSACHUSETTS correspondent of the Country Gentleman, to whose farm city gunners resort for shooting woodcock and quail, suggests that farmers might very reasonably ask the sportsman to share with them the fruits of the hunt, and he estimates that a quarter part of the game shot would be a fair share to claim. To this the editor responds that the farmer should have something more than a share of the game, he should be paid in money for the privilege of shooting. There is something in this, as many land owners have already discovered. The farm is more generally posted to-day than ever before. In many sections, in the South especially, the shooting rights are reserved for visiting sportsmen, who in return pay the taxes on the land. In such cases the owner cares little or nothing for the shooting, but is very glad to piece out his income in such a way.

We believe that the system is one to encourage. There is little likelihood that the time will soon come when the prices asked for shooting privileges will be exorbitant, or in excess of what the gunner would be perfectly willing to pay provided he actually received in exchange for his outlay a chance at game that was worth while.

From the present widely prevailing conditions of utter disregard of the landowner's rights by the visiting—that is to say the invading and trespassing—gunner, to such a common recognition of the rights of others as shall make payment for shooting privileges obligatory, is a far cry; but the new order of things would be for the true interest of the sportsman.

The more fully the privilege of shooting is regarded as a privilege, and the more commonly the recognition is insisted upon, so much the more game will there be for the decent sportsman, and so much the less for the rowdy. When those conditions shall prevail the problem of a game supply will in large measure have been solved. We would be glad to see the agricultural papers give increased attention to this subject. The farmers of this country have the game situation largely in their own hands; and the sooner they recognize the fact and it is recognized by shooters, the sooner will come an end to the raids of the ruffians who are no more entitled to be regarded as sportsmen abroad than as respectable citizens at home.

SNAP SHOTS.

We are indebted to Mr. John Price Wetherill, President of the Pohoqualine Fish Association of Pennsylvania, for the full text of Judge Craig's opinion in the famous landing net case. The opinion contains not only good law, but good common sense; and the ruling is precisely what was anticipated. We are not informed as to whether or no Judge Craig is an angler, but certainly his opinion is worthy of one who finds solace in the streams; and even if he has not fished before, we do not see how he can very well help going fishing next spring after having read up in the angling authorities from Dame Juliana Berners down.

Pine Tree gets pretty close to it in his explanation of why he makes war on the serpent kind. It is impulse based on an underlying sympathy with the snake's victims. We are inclined to believe that Coahoma and other advocates of snakes may reason and argue to the end and yet fail to overcome this prejudice which is seated so deeply in human nature.

John I. Blair, who died last week, aged ninety-seven, and worth $70,000,000, started out on the road to wealth at the age of ten as a trapper; and he used to say that never in his life had he felt richer than when he got his first dollar for sixteen rabbit and muskrat skins.

The Sportsman Tourist.

Sam's Boy.

II.—A Rainy Day in the Shop.

One day when the grass was growing perceptibly in the steady downpour of rain, Sammy grew tired of watching the ceaseless leaping of a countless host of little men as he imagined the upspringing drops in the puddles to be, none of whom ever stayed long enough for him to get the least acquainted with, nor to individualize, as he could the robin and the sparrow that came down to the same puddle to drink and bathe. He would have known them the next day, for all their looking so blurred and distorted as they were by the streaked wash of the window panes, and they put him in mind of something that made him run into the shop to his friend and boon companion.

The old man was closing up the seam of a boot leg with long, strong pulls of two waxed ends, the crooked awl going out on one side and jabbing the air, then coming back and stabbing the leather, the threads following with a squeaking swish and a tight-drawn tug.

"Hello, my man! An' what's he a-doin' on this wet mornin'?" he accosted his welcome visitor.

"Oh, not much; only watchin' the little men a-jumpin' up tu ketch the rain, an' the birds a-washin' off the' feathers; an' now I come for you to tell me a story. You said you would some rainy day, abaout them fishin' birds an' the mink—an' I guess this is that kind of a day."

"Wal, yes; I most guess I did. Le' me see!" He scratched his head thoughtfully with the awl. "Was't the kingfisher? Yes. Wal, they was tew on 'em was borned right on this brook, in a hole in the bank, on a mess o' fish bones for a nest, I've hearn tell by them 'at's seen 'em. An' here they lived an' growed up one summer, quicker'n what leetle boys does, 'at takes twenty year, an' they l'arned tu fish as handy, 'thaout usin' any hook an' line or worms, but jest the' bills an' the' wings, a-hangin' in the air over a fish 'at didn't think no more harm on 'em 'an of a thistledown a-floatin' by, till, kersplosh! daown come bill an' feathers atop on him, an' in he went along wi' a dozen others, an' a-sailin' off over the water afore he'd done a-kickin'.

"When it come along in the fall o' the' year an' got cold 'nough so't the' was spikes of ice made along the banks, these tew kingfishers started off on a long journey, followin' the streams saouth, a-stoppin' tu ketch 'em a fish when they got hungry, a-seein' shell-duck a-scootin' arter 'em under water, an' loons a-divin', an' fish-hawks a-swoopin' aouten the sky, an' men a-ketchin' on 'em in all ways, so it seemed as if the' couldn't be a fish left nowheres for another year, an' so at last they come to a country where the rivers never froze an' the fields was allers green. There was black men and women a-workin' in 'em an' a-fishin' in the streams, an' one day as they went clatterin' along a river, one on 'em lit on a stake nigh where tew black men was a-fishin' an' one on 'em says: 'There's one o' aour kingfishers, an' when he goes north in the spring, I'm a-goin' tu foller him, come what will.'

"An' sure 'nough so he did. When the birds looked back they seen him, fur or nigh—sometimes in a boat, sometimes a-wadin' when the' was bloodhounds arter him, goin' up streams when they run saouth, an' daown 'em when they run north, till he come clean here, an' then the black man bid 'em good-by, an' thanked 'em, an' another man 'at I know put him intu a boat an' he went off tu Canady, where Ann Twine come from."

"That's a real nice story, Unc' Lisher; an' naow won't you tell me another?" said Sammy, settling more comfortably on a squeaky roll of sole leather.

"Wal, the' was a leetle boy, 't was as hungry for stories as a kingfisher is for minnies, an' you couldn't fill him up no easier," said the old man.

"Not that, but another, Unc' Lisher," the child pleaded.

"Wal, I'll tell ye a story.

"'Baout ol' Mother Morey,
An' naow my story's begun."

"Oh, not that ol' tory," Sammy interrupted, kicking out impatiently, "but one about a mink. Oh, please, Unc' Lisher, it rains like everything!"

"Wal, so I will, dear heart; an' it is tew bad tu plague a poor leetle boy 'at hain't a duck an' can't go aout an' play in the mud puddles," said the relenting raconteur, cleaning his pipe with the awl, filling and lighting it while he planned a beginning and trusted to luck for a happy ending.

"Once the' was a' ol' man mink an' his wife lived in a hole in the bank o' Stunny Brook—thet's aour brook—'nunder the rhuts of a big maple tree, an' they wa'n't the pleasantest o' neighbors for the fish an' birds an' frogs 'at lived nigh 'em, I'll tell ye, 'cause they was a hungry lot, an' more'n all that, killed when they wa'n't hungry. Why, they'd ketch an' kill frogs till they got a pile they couldn't see one 'nother over, an' they was allers a-robbin' birds' nests o' aigs an' young; an' fish—my land! the' wa'n't no sati'fyin' on 'em. An' they'd kill mushrat tew, bigger'n they was. An' when they had a fam'ly o' young uns tu feed, it was ridic'lous the way them mink slaughtered right an' left.

"One day in June a man 'at I know come along there an' he seen where them mink had killed ten young pa'tridges, an' he was mad, an' says he, 'I'll pay you for that in the fall when your fur gits good, for them was my pa'tridges.' An' so when cold weather come he took some traps an' sot 'em some in holler lawgs an' some in holes, an' one in under the big maple, an' he baited 'em all wi' mushrat, which no mink can't never go by, an' when he went 'raound tu 'em he had three o' them black thieves, an' he jest knocked 'em in the head and stretched the' skins on some boards, an' took 'em daown tu Clapham's an' sol' 'em. An' I expec' he'll buy a jack-knife wi' some o' the money, for his name is Sam Lovel, an' his leetle boy wants one tu dress his fish with.

"Naow, I see a shadblow tree over there in the woods 't looks jus' like a haycock ketched in a snow storm, an' 'long in June, when the bar'ies gits ripe, me an' Sammy'll go an' git some on' 'em, an' mebby shoot a wild pigeon, if daddy'll go 'long wi' his gun. An' that's stories 'nough for one rainy day, hain't it?"

Sammy unwillingly assented and went back to the kitchen to comfort himself with a slice of bread spread thickly with maple sugar.

Rowland E. Robinson.

[To be continued next week.]

On the Edge of the Town.

Five hundred yards from my door a ravine opens out from the upland beyond. On the one hand is a lofty, rounded hill, divested of trees and laid out in cultivated fields; on the other is a wooded summit, which, in memory of good old Gilbert White, of Selborne, I am fond of calling the Hanger. Along the foot of the Hanger passes a street railway. Within the radius of a mile from this hollow live 10,000 people, and scarcely two miles away is a community of not less than 400,000 souls. *Rus in urbe.*

The other day, near the end of November, I turned up into this ravine for a walk. There had been indications of rain, and I don't know why it didn't rain, unless it was to confound the weather bureau man, whose predictions are usually to be interpreted by contraries. But the clouds cleared away in the afternoon, and the sun shone out somewhat feebly, but pleasantly. Not much can be expected in a rural walk in this latitude at this season of the year. But tired of the house and of books I felt impelled to go forth.

"Nor rural sights alone, but rural sounds,
Exhilarate the spirit, and restore
The tone of languid nature."

On the slopes at the entrance to the valley the plumes of the goldenrod still showed up in great profusion, but they were all white and frowsy—not much like the vision of yellow which but a few weeks earlier had clothed the hillsides. The asters, too, were still in abundance, but faded and withered, the mere ghosts of flowers. The herbage was generally dead and desiccated as an Egyptian mummy; but I noticed a bunch of dandelions as green as in the summer, and the yellow flowers as bright and fresh looking as ever. A very short distance up, the hollow contracted to a mere glen, little more than the channel of a diminutive wet-weather stream of water. The sides were high and steep. Bushes and trees grew along there in abundance, leafless now, or at most boasting a few brown and rustling reminders of better days. In the bushes I noticed a flock of sparrows flitting about, but entirely noiseless. I saw no other birds. I was surprised to see a black and brown caterpillar crawling along as industriously as in August, and I recalled what I had read but a day or two before in "Carpenter's Physiology" of the immunity of this creature from the effects of cold. He relates that caterpillars have been frozen so hard that they clinked like bits of ice when thrown into a tumbler, and when thawed afterward did not seem to have been at all injured by the cold; and one individual that had been thus frozen four times afterward developed into a butterfly. He relates in the same connection that frogs and snakes have been kept frozen solid in an ice-house for three years and afterward, when properly warmed up, proceeded to business as usual.

A few hundred yards up this hollow, not a house was in sight, and except the noise of passing trains no sound of human voice or industry was heard. One seemed as completely isolated as in a cañon of Colorado. Here on a slight shelf stood an immense buttonwood tree. The earth was high up against it on the upper side, while on the lower side the great arching roots stood up a foot or more above the ground, revealing a ledge of rocks behind them. The evidences of fire were under this tree, and it is said to be the favorite haunt of night prowlers who occasionally descend upon the neighboring hen coops. I could imagine the vagabonds basking in the firelight in this secluded dell, and their fragrant regale on the corpus delicti of fruitful biddy, or of chanticleer purloined from his accustomed perch. Not a leaf was now on this tree, but a wonderful crop of buttonwood balls were pendent from the branches. I wondered why nature should produce so abundantly a fruit that seemed to be of no use. And this led me to consider the vast waste that is continually going on in nature—the millions of seeds of plants and ova of fishes that never fulfill their manifest destiny, and the floods of light that are forever streaming off from the sun into the regions of empty space. The front of this tree I observed had been used to support a target; but I should judge from the scattered mounds in the back that he who had been practicing there was not a skillful marksman.

Up through this hollow came at intervals the voice of the barnyard fowl, crowing defiance to all his tribe. The brown leaves rustled faintly in the light breeze. On the hillside the cattle moved leisuerly, cropping the scanty pasturage. Here upon the ground lay an odd-looking piece of limestone, in shape resembling a pack-saddle, such as our fathers used in transporting goods across the Alleghanies, but in size suggesting the pelvic bone of some monster of the preglacial age. The ravine leads on up the slope, becoming more and more shallow as it proceeds, until at the top, where the turnpike passes along the ridge, it reaches the level. A little beyond is the summit of the hill.

"Now roves the eye;
And, posted on his speculative height,
Exults in its command. The sheepfold here
Pours out its fleecy tenants o'er the globe.
At first, progressive as a stream, they seek
The middle field: but scattered by degrees,
Each to his choice, soon whiten all the land.
There from the sunburnt hayfield homeward creeps
The loaded wain; while, lightened of its charge,
The wain that meets it passes swiftly by;
The boorish driver leaning o'er his team,
Vociferous, and impatient of delay."

Such the scene presented to Cowper from the hills about Olney—not such to us from this coign of vantage. Off to the east only a mile or two distant we see the outskirts of the city; to the west the fair valley of the Chartiers, not occupied as was the valley of Bagdad in the famous vision of Mirza, by oxen, sheep and camels "grazing upon the sides of it," but with scores of handsome dwellings, each standing in its plot of green.

Descending the hill by way of the Hanger, I stopped to notice where there had been a recent landslide. The railroad below had weakened the underpinning of the hill, and in a recent wet spell a mass of land, nearly a quarter of an acre in extent, had slipped forward and downward a distance of 2 or 3 feet. I had observed the laborers removing the débris below. I noticed that great roots 5 or 6 inches in diameter had been broken short off like pipe stems. The force that could pull two such roots must have been immense. The trees had not fallen or changed their relative positions in any manner, except that they had migrated in a body 2 or 3 feet further down the hill. Had Macbeth beheld that movement he might well have thought his time had come.

From the hillside I looked forth over the landscape already growing dim in the early dusk.

"I saw the woods and fields at close of day,
A variegated show; the meadows green,
Though faded; and the lands, where lately waved
The golden harvest, of a mellow brown,
Upturned so lately by the forceful share.
I saw far off the weedy fallows smile
With verdure not unprofitable, grazed
By flocks, fast feeding; and selecting each
His favorite herb; while all the leafless groves
That skirt the horizon, wore a sable hue,
Scarce noticed in the kindred dusk of eve."

Ingram, Pa. T. J. Chapman.

Doctor Novice.

If you think a whole lot of a man, you will demonstrate it more fully perhaps than in any other one way, by asking him to go on a hunting trip with you. It implies a heap of real admiration for the man; you take him into the "solitary confines" of confidence, and often become his bed-fellow. If he be a novice and you know him to be of the level-headed sort, you can take him along and retain or increase your admiration. If he be of any other kind, you can only do better in the way of friendship and respect by leaving him home, for if you do take him you may tell of your manly achievements on one leg or minus an arm, or go through life blindly, and call yourself an ass in love with a fool, and one would naturally think an ass too stupid and a fool too blatant to love a shotgun, but this unfortunately is not altogether a fact. (Read the daily papers for daily particulars.) In many cases the fool fortunately exterminates himself, but the ass unfortunately hits the other fellow; so in inviting the novice to go shooting with you, be quite sure he is entirely a man in most all things, and he is more than apt to be on the sunny side of your affections when you get back home, and you won't need any repairs.

My recent experience was of this kind, and I feel that I have launched an enthusiast of no mean order, not to mention the good time spent in watching the slow, but sure, development of my Doctor Novice.

Grouse hunting in Pike county sounds interesting; to know anything about it, however, is like Masonry—you can only know it after various stages of "being there." Many have tried this kind of hunting and quit; others have seasoned it once or twice and have declared for something easier; others again will realize their aproaching years at this game as in no other way. English setters of a positively well-known mettle have been known to balk and lie down at it, while others will whine at the peep of day to remind you of the limited rest for the weary. Yet, for me it has a fascination stronger than any other hunting, and even though my locks are getting frosty and dear old Jennette begins to "look the weight" of time, I shall hope to look yearly into those ravines, and cross those tangled barrens, and good Jenn's children and grandchildren shall be my companions. It takes one very much out of the beaten paths of man, tries very hard his gun judgment, experiments so nicely with his skill, taxes all of his used and unused muscles, and makes so many of them feel as though he could never use them again, strikes so viciously the bullseye of his patience, and gives him such an incentive to shoot and do it quick when a bird rises.

At this sport, as in many other things in life, 'tis the unseen things that are to be dreaded; prominent and positive, among other things, are the leaf-covered broken rocks, that one must step over, on, in under and around. To do this correctly and systematically one must be born among them; it cannot be acquired; the trapeze performer or a master of terpsichorean art would break every bone in his body hunting in Pike county, just as quickly as any one else. I am just out of bed from a fall during my last trip, and find sweet and soothing consolation in the fact that it didn't occur on the first or second day out, and that the Doctor, while fall down he did, didn't get a scratch, and was at all times (but once) as fit as sweet cream to ripe fruit.

A hundred miles in a whist game and nine miles in a mountain hack brought us to our destination at 8 o'clock; at 9 our host and family and guests retired, or rather the family did; Doctor and I went to our room; at 10 o'clock the Doctor wanted to know the habits of rattlesnakes on Oct. 16, and if I thought they could "hit" through his brand new dollar and a half leggings; at 11 o'clock he said: "It's too early to go to bed; let's smoke"; at 12 o'clock he sought my theory as to the most expeditious way to get away from a wildcat with No. 7 shot; at 1 o'clock he thought a man a double-barreled ass to tackle that bear-ridden country with only a 12-bore shotgun as a weapon of defense; at 2 o'clock he reported from his window at the side of the bed that the fog was lifting; and at 3 that it had lifted, and he thought we would have a nice day; at 4 he thought he had better begin dressing, as he wasn't just sure where his good wife, mother and baby had packed his things, and the room was small for two to dress in at one time any way. At 4 that afternoon the Doctor's whole argument was that a man should not do too much in one day, and from a scientific point of view he ordered himself to go to the house and lie down; he had caused enough slaughter for one day anyhow—he had killed the first two grouse he had ever seen on the wing—certainly a satisfactory day for my Doctor Novice.

That night he slept with the rattlers, the wildcats and the bears, and was not disturbed—neither was I.

Each day added to the Novice's laurels, every day brought its feathery reward, and all days brought about scenes and incidents that the door to memory will never close on. Sensations that had never been born came to light on that memorable trip in us both, and as I sit now alone and away from those rocks and tangles, I can hear and see the Doctor as he calls: "Elmer, hurry here; Jennie is pointing; be quick." The Doctor and Jennie are in an old woods road, while I am breaking brush at the edge of a swamp—Jennie had followed a bird out to the edge of the road, gone into the clearing and come to a full point. The situation was such that I could do a flank movement where I was and give Doctor the experience and the shot. I called to him to cool off, step in, flush the bird and shoot. Instantly I heard a cracking of brush, a whirr, a whizz, a roar, a bang and a flutter, and then the Doctor calling: "Dead bird, Jenn; fetch, fetch, Jenn; dead bird." The Doctor stepped into the road, I called my congratulations and proud Jenn presented him with a "wing-tipped" grouse, handling it as gently as a hospital nurse; imagine my new born sensation, however, as I heard the Doctor calling. "Shake it, Jenn; shake it; kill it, Jenn; kill it; shake it, Jennie; kill it Jennie." I hurried the guide to this scene of anxiety, while I rested my aching sides against an old log. Shortly after this I fell and wounded my kneecap—Doctor's idea of a "retriever" had weakened me. I have since asked him what part of that bird he would have preferred had Jennie obeyed his terrier demands.

In another year he will be my Sporting Doctor. He was ever careful, but enthusiastic, untiring and uncomplaining (after his theory had exploded itself the first day). If birds were scarce, look elsewhere—if he missed one, it was but too natural. Our bag was not heavy, but my fall was. I would never have known the bore of his gun from "seeing the muzzle," and it only went off when pointed at a bird, and my location known. He strained it perhaps at times. Ruffed grouse don't give one long to study time, space and distance, and the Doctor liked the noise. They are racy birds, and are apt to convince both man and dog how much and how little they both know all at once.

The remembrance of this outing with the Novice still warms the blood, and allows the palate to rest on sweet things.

THOS. ELMER.

ELIZABETH, N. J., Nov. 1.

On Kansas Prairies.

LANG, Kan., Nov. 17.—This morning there came to my notice one of those little incidents that linger so long in the thoughts of those who love the outdoor life, and I have thought that others might like to share it with me. Perhaps I might first put over against it a bit of New England life that came to me years ago.

Having business that called me to one of the little towns on the B. & A. R. R. up among the Berkshire Hills, I took the early train and reached my destination before daybreak. As the station was deserted, I lay down on a settee out on the platform. The morning was dark, warm and damp, with the coming of a summer rain, but as the day dawned the forms of the hills that surrounded the station, clothed in all the beauty of the New England forest, came into sight. Down from their heights came the morning notes of the wild birds, at least apparently vieing with each other which should give thanks sweetest and best. Absorbed in all this, I lay still until a slight noise drew my attention up the track, and there, but a few rods away, coming down grade, as silent and noiseless as a wild beast creeping on its prey, was one of those monsters of civilization—a locomotive. Of course, in a moment the air was full of its rush and roar, but as I write, the memory of the sweetness and music of that morning so suddenly broken into comes to me clear and strong, although miles and years—many in number—lie between me and the day and the little station up among the everlasting hills of New England. This for New England.

This seventeenth morning of November here in Kansas dawned bright and warm, and though the quail were whistling in the slough close by the house, and I knew that among the grass and stubble the rabbits and prairie chickens were hiding, yet, dutifully, I went afield to a day of hard, distasteful labor. As the morning wore on, a great bank of fog—something very unusual for Kansas—came drifting up from the southward well up from the earth; then down from the north, as if to drive it back, loudly honking out their discontent, came a great flock of those forerunners of cold and sleet and snow, the wild geese. Slightly blinded and bewildered by the fog, and realizing that they were too near the earth for safety, they swung to the east, and then, true to their wildfowl compass, resumed their southward course, and were swallowed up in the great beyond.

Several times through the day the rabbits have scudded away almost from under my feet; the plaintive cry of the quail scattered out by some one of their many enemies, came floating across the fields; and just after sunset from more than one direction came their call as they sought their nightly resting place. Add to this the swift, silent passing of a shadow that draws the eyes upward to see an object—always of deep interest to me—one of those keen, matchless hunters, the prairie hawks, seeking its daily food; and sometimes just at dusk from two to twenty great brown-backed grouse of the prairies swing by on their way from their feeding to their bedding grounds. All these things help to make up the fascination that binds one like invisible but none the less powerful bonds to these great boundless prairies. Each one also a reminder of the glad to-morrow, when, free as the wild creatures themselves, I shall seek out their hiding place, and (though very seldom is that the case) I may return, so far as fur or feather is concerned, as empty-handed as I went out, yet it is with an ever-increasing store of memories that are good to think upon, so long as mind and memory shall do their appointed work.

PINE TREE.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

Boyhood Days in Florida.

III.—My Winter Home.

The Lodge was a plain, low-roofed, one-story building. By itself it had no special claim to beauty, but with its setting of rich green orange trees it made a pretty picture. Besides, it was to be my winter home, and imagination at that moment would have made a palace out of the rudest log cabin. A few wooden blocks served for foundation, a most rickety one in windy weather. No paint covered her sides, though a close inspection revealed traces of whitewash now almost obliterated. The windows were small and low, while an open hall from which doors opened into the various rooms extended through the middle of the building. A covered porch adorned the front of the edifice, while in the rear a low platform with long benches on each side served as a wash room and woodshed. Such was the building which marked the end of my long journey. Here I was to live, and cook, and eat, and sleep. From this place among the fragrant orange trees I would start off on my hunting and fishing trips into the yet unexplored paradise. Here at night I would bring the results of my day's shooting. Here I would spread out before the envious eyes of my new companions specimens of game that even my boyish fancy could not adequately picture. Within these rough walls I would write on rainy days to my friends at home, and, oh, what wondrous tales I would have to relate to them! No wonder then that a feeling almost of awe crept over me as I gazed for the first time on that rough but cozy building.

The gate is open, and we drive inside. The picking has begun, and the Lodge is consequently occupied. Most of its tenants are just at this moment down at the packing house or up the ladders among the thorny branches clipping off the golden fruit or thrashing wildly at the swarms of gnats—the pest of Florida—that dance wildly about their heads. One of the boarders, though, remains at home. It is his day to cook and wash dishes, I afterward learn. As we drive up to the back door he is out on the porch chopping—what? Kindlings? No, it can't be that. We drive nearer, and as I dismount from my seat he looks up from his work with a sickly, sheepish grin on his boyish face, and then he begins to apologize in a confused way, and we learn the cause of his embarrassment, for there by his side lies the still warm baking pan, and in his hand he still holds a batch of warm biscuit partly split asunder by the blows of his hatchet. Gus breaks into a good-natured laugh; the hard-working cook grows red and tries to smile, and I—well, I just stand with my mouth wide open and my eyes sticking far out of my head. This was a phase of life that I had not associated with my new paradise. But Gus brings me back to a normal condition again by formally introducing the cook, and now that the ice has been well broken I begin to feel more at home. We enter the house, and for the first time I gaze upon the interior of my new home.

There was certainly nothing portentous about the interior of the Lodge. The rooms which led directly off from the open hallway were square, with whitewashed walls, unadorned save by the carcasses of hundreds of mosquitoes that former occupants had inartistically nailed to the wall, with newspapers for hammers and blood for spikes. Three of these rooms were used for sleeping rooms, and the other for the kitchen, while the hallway served as a dining room.

As we investigated all the mysteries of that rough building, I began to get well acquainted with my new friend the cook. He was a fellow only a few years older than myself and had been turned loose in Florida under conditions so nearly like my own that we had at once a common bond of sympathy on which to base our friendship. From him I learned many points of interest about the life that was in store for me, and the class of men with whom I would be thrown. The "crew" consisted of fifteen or twenty men, mostly darkies, and of these the larger part lived in the neighborhood, so that at night our rather narrow quarters were shared by only half a dozen of the number. But they were all good, jolly fellows, I was told, and such indeed did time prove them to be.

Interesting as I found the Lodge, it is not strange that my thoughts were still for the most part concerned with the surroundings. The place where I was to live was of course full of significance; but after all what interested me most was the grove itself, and more especially the wild stretches of hammock which bordered it on its lower side, and which stretched away for miles even to the banks of the St. Johns River. A thick, richly colored, luxuriant swamp—an ideal game country. I strolled down through the grove, past the yellow piles of lately picked fruit; past the packing house, where, through the open door, I caught a glimpse of the bustle and activity within, until at last the orange trees came to an end and before me lay the swamp through which our road had led us on our recent trip from the lake. To my eyes the place before me was a veritable fairyland, full of rich promise. In that wild tangle of vines and underbrush there must lurk all kinds of game. The huge white-limbed cypress suggested squirrels, coons, possums, wildcats and perhaps even panthers, while the underbrush, I felt sure, concealed unnumbered rabbits and turkeys. I had been assured that numbers of the panther family were still occasionally found in the neighborhood. There was a certain charm connected with the thought, but still I must admit that my mind preferred to dwell on game more in keeping with my thirteen years and 12-gauge shotgun. Even in the grove itself I found that ample opportunity would be afforded for testing my skill as a marksman. Flocks of sand pigeons were continually rising before me and hurrying away with that peculiar whistling of wings which I came later to know so well. A flock of quail, too, had given me a glimpse of their fleeting forms, as they made for a neighboring grove. And even while I stood watching the lights of the setting sun as they were beautifully reflected on the rich green of the orange trees and palmettos a rabbit stole cautiously out of the deep grass in search of his evening meal. Surprise followed by disgust at this new intruder must have seized him, for stamping angrily he beat a hasty retreat. I had been at my new quarters only a little over an hour, and already my heart beat fast and my enthusiasm was growing. By the next day I would be ready to start on my campaign, and right here in the grove itself I saw evidences of plenty of sport for the present. Those poor fellows working all day in the packing house, or fighting gnats up in the tops of the orange trees, would now have all the fresh meat they could eat, and I promised myself that I should become a most necessary addition to the little colony at the Lodge.

But the daylight was fast leaving; the packing house was already deserted, and reluctantly I made my way back to the dingy looking building, where noises were already arising suggestive of the evening meal. I was introduced to my new companions, and which eyed the other more curiously it would be hard to say. I watched the cook as he busied about his preparations for the coming repast. I smiled as I saw the famous biscuits carefully located on tin plates on the rough table. Fried mush, biscuits and coffee composed our humble fare, and then the chairs were pushed back, the table placed at one side, and the darkies were allowed to take charge of the evening's festivities. Two rusty harmonicas were soon produced and began to squeak out a typical Southern plantation jig. Two of the best dancers jumped into the middle of the floor, where, inspired by the spasmodic notes of music, the clapping of hands and stamping of feet, they commenced a series of lively shuffles and wild leaps. The crowd applauded and stamped more vigorously. The contagion spread, until half a dozen ecstatic figures were shuffling, jumping and whirling around the circle. But at last physical endurance no longer could stand the strain, the music ceased and the dancers, from sheer exhaustion, sank into their seats. It was a novel form of entertainment for me, and one which strongly appealed to me. As the days slipped by I came to feel that no day was complete without our after-supper "shuffle."

But it was now late. The journey with all its novelty and excitement had just about exhausted me, and I was only too willing to seek my room and bed. Even the combined attacks of mosquitoes and fleas—evidences of which were plainly visible the next morning—failed to disturb my rest that night, and when my companions roused me early the next morning I was ready for whatever the new life might have in store for me.

A. E. STEARNS.

Natural History.

Birds of the Ojai.

THE ornithology of Southern California, especially in the case of small birds, such as hummers, and sometimes in that of larger birds, frequently exhibits purely Mexican types, which are more noticeable and more interesting for being seen where they can be compared with Northerners of the same class. Seeing the two races in this way brings out the peculiarities of each. The foreigners are not only interesting in themselves, but by contrast make the natives seem more interesting, and differences of action, habits and appearance are plainly seen.

The Ojai, which is pronounced "ohi" and means "nest," is a mountain valley that runs inland from Ventura and spreads fifteen miles from the coast like the bowl of a spoon, the broadened part being at least eight miles long and two miles wide. Mountains that are, oh, high, nearly surround the place. Live oaks like great green buttons stud the plain. Several timbered streams cross it in erratic lines. The Indian chieftain Matillija, a renowned hero and horse-thief of the Mission era, held the valley against the Spaniards for years. A sturdy population of fruit growers own it now. The orchards are beautiful when seen from the hilltops. They are visited in fruit season by birds of every description.

Our home is a suburban residence in a live-oak grove a mile from Nordhoff, the valley postoffice, and the premises are equipped with numerous hydrants that are fed by a large tank, several spigots near the house having beneath them large stone Indian mortars as basins, which are very attractive to the birds, and with the fruit cause many to come every day from the dry creek bottom behind the place and from elsewhere. There could not be a better opportunity to study ornithology, and our knowledge in that line has increased with strides.

We have spent many pleasant hours this summer in watching the bathers that come to the pools in shrieking flocks, the numbers greatest on close mornings and hot afternoons, to drink and plunge and preen and sing, all of them with a picnic spirit determined to have a pleasant time. Filling the basins with fresh water by any of us is a signal for all feathered creation to assemble a few at a time or in large flights, some individuals bold and some shy, some quiet and some noisy, some amiable and some pugnacious, but all of them very happy. A pool full of small birds surrounded with ripples and spray of their own making is a charming sight.

The linnets, or house finches (*Carpodacus frontalis*), pretty crimson-headed birds that resemble the Eastern purple finches in appearance and the English sparrows in their preference for dooryards, come in great flocks to chirp and sing musically while a few of them at a time bathe fearlessly and perform astonishing feats, even to swimming back and forth over the deepest part of the basin—exploits that arouse enthusiasm in every sparrow's heart, and also within us. These birds are mentioned repeatedly in the story of Romona; they make the yard of every California home seem cheerful.

The Arkansas goldfinches (*Astragalinus psaltria*), the canaries spoken of in Romona, also come in large numbers, and with them the American goldfinches, or lettuce birds, a more beautiful variety. Sometimes a black-faced Lawrence goldfinch will appear with a flock of other kinds. A black-backed Mexican that stayed around for several days was harassed by young birds of the Arkansas variety until he asserted himself and drove them off. His plight at first was sad, for he was very thirsty; but by a desperate plunge into a very hostile camp he obtained a few sips of water. The next time I saw him he was chasing the young birds.

The black-headed song grosbeaks (*Zamelodia melan-*

cephala), heavily built birds with plumage very much like that of the Baltimore oriole, enthusiastic bathers that plunge and spray vigorously for a long while whenever they enter the water, are very pugnacious and chase every venturesome tomtit in sight to the brush bottom. The song of these grosbeaks is not equal in beauty to the song of the rose-breasted variety of Wisconsin, but is more like that of the robin or scarlet tanager. During the nesting season their notes are heard mornings and afternoons from every direction. The propensity of these birds to destroy fruit has made them exceedingly unpopular with ranch owners.

Scrubbing the basins with a broom several times a day is pleasant labor to me, as the birds seem to be so grateful for the pure water they always find, and so many of them come. Orioles in every shade of yellow, California jays feathered in blue, slate-colored cañon towhees, Oregon towhees with white shoulders, sapsuckers, Western wood thrushes and wood pewees, fly-catchers with plumage like that of Eastern snowbirds, yellow-breasted chats, golden warblers, tufted titmice, nuthatches, vireos, bush tits and so many other visitors come to the pools I tend that it is impossible for me not to feel as though I with my well water were a reformer and might in time win every straying chickadee from the gutters and other low haunts of the neighborhood—a worthy ambition, surely. Little bush tits in swarms, shoulder to shoulder, often line the shores of a basin. They are a pretty sight. Almost any depth is "over head and beak" to them. The California woodpeckers, grotesque with their black and white faces, are clumsy harlequins that endeavor to assuage their thirst from leaky spigots while clinging to the upright pipes. I think they never bathe.

Lark finches (*Chondestes grammaca*), enormous sparrows that exhibit a great deal of white on head and long tail, are not only very handsome, but are also very able songsters, and great numbers come here every morning to perch in the trees after a visit has been paid to the water and entertain us with music that is even sweeter than the notes of the delightful little song sparrows, the chorus seeming to be most animated during the hottest weather and thus becoming an incentive to us to be courageous too, for the heat is something remarkable at times in these valleys. The performers deploy themselves over the ground at intervals to search for food; but even during these slight cessations a few persistent birds are likely to warble on among the limbs. The cheeriness of these birds has made them great favorites with us.

The California thresher is a peculiar individual. Their slaty plumage, like that of many other local ground feeders, corresponds very nearly with the color of the dark soil. One of these large thrushes gave me an opportunity to study him a few mornings after we arrived. After taking a deliberate drink he approached within a few feet of where I was sitting and then probed with an odd motion of his head the insect holes in our walk. The ungainly, bent-billed creature could not have been proud of his looks or his awkward stride. His flight afterwards was that of a clumsy bird.

The hummers are feather gems. The green of their back is various. Throats are black, white, rosy, and otherwise marked. These bird midgets are very tame and sometimes touch my hand in their efforts to drink from the hose. Flocks of them play in the mist of the garden sprinkler when it is running. Numbers of them come from the weeds in the pasture lot whenever the spigot near my tent is allowed to flow early in the morning, and are daring.

The red-shafted Mexican flickers are very handsome. They are quieter than the yellowhammers of the East and seldom utter a note. Flocks of common doves forage about the grain fields, where they become very fat. They are protected by a game law and offer great sport to the wing-shot. Some of the stray specimens I have observed as they darted down mountain cañons had acquired a terrific speed. They recalled to me the frightened doves I had seen in the Florida wilderness. The meadowlarks are less like the Eastern variety. A noticeable difference can be detected in their song. It begins with the simple notes of the Eastern bird, but becomes a frenzied outburst delicious to hear.

Valley quail can often be heard in the creek bottom calling to one another in raucous voices not unlike those of the Virginia bird when half grown. A few couples have even been flushed from distant rosebeds. During a walk down the creek road I saw many coveys. One lot had started across the road when they perceived me coming up from a ford and wheeled; but after a short pause they began crossing again to climb the mountain side, their gala head plumes waving, their blue uniforms a striking display. Some hid and a few took to their wings. A puffy general concealed himself far up the hill and screamed for help. Dewey and Schley ascended the fore-tops of the nearest saplings to inspect me. The rank and file behaved courageously. The troops went out of sight. The piping could be heard among high-up boulders; the review was a thing of the past. California game birds are very pretty.

Deer and quail had become almost extinct here a few years ago from indiscriminate slaughter by would-be sportsmen, but efficacious laws were passed, as results already prove, and game is becoming plentiful again, for I flushed at least a dozen quail coveys during my walk that morning, and I have heard from reliable sources of the deer being more numerous in the cañons this summer than they have been for some time. Deer hunting, which is a summer sport in this part of the country, tests the endurance of the toughest when pursued among mountains where every hill is a red hot stove thousands of feet high and every breeze scorches, where shade is not abundant and water is scarce; but many of the local guns go, and some day I may try my luck. The cañons are driven for game, I have been told. Quail hunting, a winter sport, is good in the valley and must be delightful where the atmosphere is so bracing and the natural surroundings are so beautiful.

Singular, isn't it, how writing about the birds at the pool has led me astray till I seem once more to be an astonished creature among whirring coveys and hopping bucks? Forest birds, when seen about the house, always did recall to me life in the wilderness with its pleasures, and dooryard birds, when seen around camp, have just as surely reminded me of home—with its pleasures!

H. R. STEIGER.

VENTURA COUNTY, Cal.

The Angora Cat.

THE saying that "a cat has nine lives" may be true of certain felines whose tramp life has made them tough, but an intimate acquaintance with the aristocratic and pampered household cat has brought to my consideration the painful fact that not only has it but one life, but that this one hangs on a very delicate and precarious thread. Frequently what might have been superb specimens of the Angora species have come under my observation emaciated creatures, with rough, dry fur, lack-luster eyes, and a cough which a stage Camille might well envy. Tuberculosis, pneumonia and various bronchial diseases have in each case been assigned as the cause, but long experience has brought its wisdom, and when such a sufferer comes under my treatment I diagnose its symptoms as "milk," and I have yet to find where my diognosis has failed, for all cats, whether of high or low degree, if fed on milk, sooner or later come to this condition. I have long since given up wondering why the cow, that creature of coagulation and curds, was ever invented. It is responsible for nine-tenths of the suffering and mortality among the creatures who come under the misnomer of "pets."

"But my darling loves milk" is often brought forward as an argument in favor of this erroneous diet by ladies, who are more sentimental than hygienic. I can only answer, "Yes, but your darling does not love the caseine and the lactic acid which the milk produces after it has undergone its chemical change in his stomach. The parasites which are bred from these conditions and thrive on them do love milk, and it is only a question of the survival of the fittest—which shall live, the cat or the worm."

Not long ago a skillful veterinary made an autopsy on an Angora milk-fed cat which had died presumably of consumption, and I am convinced that had the people who persist in giving milk to their pets seen the waxen lump, swarming as it was with biting, squirming, hungry life, in the animal's intestines, they would have forever more forsworn milk.

The cat is essentially a meat-eating animal, and in order to keep it in good condition it must have meat. By meat I mean beef or mutton, for I do not dignify by the name of meat either veal, pork or liver. These will produce all sorts of disorders. The meat is better if given raw, and beef kidney is nutritious and easy of digestion. Second to meat is fish, if it is fresh from the water, and is supremely wholesome if given alive to the animals. Even so great an authority as good old Dr. Johnson erred when he went to the fishmongers for oysters for his cat, for the oyster is a pernicious ptomaine poison in the cat's system. Lobsters, clams, muscles and scallops, on the contrary, are wholesome.

Now and then I have had the pleasure of meeting an Angora in exuberant health. These shaggy animals had been fed in kittenhood on malted milk, or some prepared food in which the deleterious properties of milk are destroyed, and in addition to their daily raw meat, they would eat cooked vegetables (notably carrots); eggs, raw and hard-boiled; bananas, and baked sweet potatoes.

In order to keep the fur of the Angora glossy and luxuriant it must be thoroughly brushed and combed every day, and a sponge dipped in tepid creoline water (twenty drops of creoline to a cup of water) will keep the coat lustrous and long. The fine, silky hair on the cat's belly is apt to become a tangled mat unless say once a week vaseline is rubbed in and permitted to remain over night. The dead hairs comb out easily in the morning. Unless it is removed the cat will be covered with fleas, for these pests use the warm cocoons as incubators in which to hatch their eggs. But under no circumstances must any preparation of carbolic acid come near a cat's skin, for it means certain death.

In purchasing an Angora, it is always well to look at its mouth. If the roof, gums and tongue are the color of pink coral you may be sure the animal is in good health.

The ignorance in regard to the hygiene not alone of cats, but of all pets, is something stupendous, as well as pathetic, because it too often goes with a very sincere affection, and a very poignant grief when all is over with the unfortunate sufferer.

As a certain kind old lady once said to me when her kindness had brought to an unnecessary death a magnificent white Angora, whose value was $100, "I don't see what killed poor Muftie. My butler made him a lobster mayonnaise every day, and I kept an Alderney cow so that he should have a bowl of fresh cream for his breakfast, and I bought him all the marron glacés he could eat." I had no heart to enlighten the poor lady—her grief was so genuine—that the secret of love for one's pets lies in the word "abstain." To give animals food that is distinctly bad for them because they like it is after all only a form of self-indulgence which hurts the cat more than its mistress.

In a word, then, if you really love your cat and would keep him in health, happiness and a good long life—the allotted term of which is from ten to twenty years—you must bear in mind that one word—"abstain."

JUSTINE INGERSOLL.

NEW HAVEN, Conn.

Just Because a Snake is a Snake.

Editor Forest and Stream:

I read with much interest the various comments on the serpent family that find their way into the columns of FOREST AND STREAM, and although I know that for the most part, so far as the human race is concerned, they are harmless, yet I seldom spare even the least of them. The trail of the serpent—great or small—is ever marked by a line of suffering indescribably horrible. I have heard too often the agonized cry of the helpless toad and of the suffering mother bird robbed of her young, ever to stay my hand. The snake is but taking his food in his own way, and as he has a perfect right to do; but it is such a loathsome, horrible way, and it is always the innocent that suffer; for the fighting tribes, the cranes, herons, hawks, crows, and to some extent, at least, the blackbirds (for once while fishing at the Southwick Ponds in Massachusetts I saw a flock of them chase a fair-sized water snake across a narrow strip of water), can fight him off and even carry the war into the enemy's camp. But the smaller tribes must give up their lives. I fully recognize the extreme beauty and grace of the serpent's form and coloring, but none the less crush him when I can.

PINE TREE.

Perhaps a Varying Hare.

MORGANTOWN, W. Va., Dec. 2.—*Editor Forest and Stream:* Last Thursday a party went rabbit hunting from here and killed and brought home with them the largest common gray rabbit that has ever been heard of about here. It measured 32 inches from tip of ear to tip of tail, and weighed 9 pounds. It was to all appearances an ordinary "cotton tail" in all but size.

Hundreds of people came to see it. It was run about three miles by hounds before being killed. The hide is preserved as a curiosity by Mr. Kiger, who killed it.

EMERSON CARNEY.

Linnaean Society of New York.

REGULAR meetings of the Society will be held in the American Museum of Natural History on Tuesday evenings, Dec. 12 and 26, at 8 o'clock.

Dec. 12.—Thomas Proctor. "Our Chewink and His Friend: A Story from an Aviary." Living illustrations.

Dec. 26.—William P. Lemmon. "Notes on the Taking of a Duck Hawk's Nest on the Palisades." Illustrated by a series of photographs.

Long Flight of a Partridge.

SING SING, N. Y., Nov. 28.—What is the limit of the flight of a partridge? Not long ago two were scared, probably by the blasting in the gravel quarries under Hook Mountain, and flew from the top of the mountain across the river to the edge of the bluffs here, a distance of four and one-half miles. One was so tired that he was killed with a stick. The other managed to get away.

CHAS. G. BLANDFORD.

Game Bag and Gun.

West Virginia Game.

"ARE you going hunting to-morrow?" This question is asked in Romney more this fall than for thirty years. Why? Because game is more plentiful than for the past ten years. To the sportsman desiring to hunt within easy access of Washington or Baltimore there is no place that presents the advantage that he can secure in Hampshire county. Owing to the law not allowing the hunting of deer for five years the deer have had an opportunity to breed unmolested, excepting in rare instances. But as the game has increased our wise or otherwise Legislature has seen fit to pass a prohibitory law demanding of the hunter of another State a license of $25, good only for one season and in the county which the license is issued. This license practically shuts out the sportsman and gives the game hogs and pot-hunters who hunt to sell a "trust' on the hunting business. Of course the license law exempts the gentlemen who own game preserves. The whole cry of law makers on the game subject is Protect the game! In the State of West Virginia we have to-day a game warden drawing a salary who has never appointed a deputy game warden, nor has never been heard of since his appointment east of the mountains. Consequently strangers are coming in hunting without a license; residents are pursuing deer with hounds, and no particular effort made to punish violators of the game law.

Then we have a law which prohibits the shipping of game outside the bounds of the State. This law works an injury to the real sportsman who might possibly come and take out a license. He, if lucky enough to kill any game, is confronted with this, and if a man of very strict views on the game question will not attempt to take it out of the State. Not so with Mr. Man who hunts for the money. He brings his game to town, sells to the merchants, and as is being done here, he ships to Martinsburg to a party there who is running the risk of being caught and is reshipping to other States.

This being in the height of the season, and the weather being fine, our local sportsmen are bringing in lots of deer. The past week showed up nine deer brought in, all killed within five miles of Romney. They have commenced the week beginning the 20th by killing four deer, one being a six-pronged buck weighing 180 pounds. Altogether there have been over forty deer killed near Romney since the season began, commencing Oct. 15. The season for deer ends Dec. 15; but last fall although against the law the grand-dad deer of West Virginia was killed on Middle Ridge, eight miles from Romney. It was an enormous buck, weighing 284 pounds, gross. This deer head was mounted by a taxidermist of Pittsburg, and the gentleman who owns it has refused several offers of $35 for it. Strangers will find our people as a rule very hospitable, and our game territory not as rough to hunt over as one would expect. Romney is situated on the South Branch of the Potomac, 150 miles west of Washington, and is reached by the B. & O. R. R.

In the early fall wild turkeys were plentiful. But at present the flocks have become scattered, and consequently are not as easy to kill as they were before becoming scattered. Pheasants are more plentiful than they have been for years. With a dog broke for pheasants, and a man that can hit them, a splendid bag could be made in a day. During the summer months partridges seemed to be plentiful; later on they seemed to disappear from the fields, and I have flushed several large coveys in the woods while driving for deer. A gentleman from Martinsburg secured twenty-two here in one day's hunt.

As to our black bass fishing, many Washingtonians can testify that years ago this stream was unexcelled. But owing to many and varied causes, it is not as good as it used to be, but still affords some fine fishing. Our fish laws are as peculiar as our game laws. For

tance, one part of the law says it shall be unlawful to ch fish between the 15th of April and the 15th of the lowing June, which is supposed to be during the wning season. This is a good law, but makes the e too short, as the bass caught early in July are still of spawn. The law then goes on to say that it is ine to have bass in your possession, caught in any excepting with a hook and line. This summer a ty of men rafting cross ties down the river caught of bass in the muddy water by running the rafts out t to the shores over the bass spawning beds, and bass in order to escape would jump on the rafts. The did a nice business, as they got 10 cents per pound heir bass; but, becoming bold, they at one time brought ack containing sixty-three bass into town, dumped n on the sidewalk and commenced selling them to ry one that would purchase. They were promptly sted, and it being their first offense they were let with a small fine and a lecture by the magistrate. s fall the United States Fish Commissioner placed in South Branch a nice lot of young bass, and next on we look for a good catch of bass. JIM B.

MNEY, W. Va., Nov. 29.

Two Days' Hunt at North Hudson.

the eastern part of the town of North Hudson, some- g more than a hundred miles north of Albany on the road that was the only highway connecting north south in the early days of the century, is a wild, ntainous region that, though overlooked by tourists travelers in general, is not lacking in natural beauties. region is, and always has been, a good breeding nd for deer and partridge, and were it not for a ewhat lawless spirit which characterized local senti- t as regards the hounding of deer, the place would t present an ideal point for sportsmen.

ough the hills along the post road are ledgy and h-covered, there are numerous hardwood ridges to west clothed with giant first-growth beeches and es, and at a higher elevation a continuous forest of ce and other evergreens.

is only half a day's climb to the summit of one of main ranges of the Adirondacks, culminating in the t mountain masses of McComb and Dix, just under feet in height, and from these mountains, as well as lesser ones, Niagara, Camel's Hump, Buck Moun- and Spotted Mountain, a dozen fine trout brooks take rise.

ese brooks, in conjunction with streams from the unite to form the Schroon River, one of the effluents e Hudson.

e nearest railroad station is Port Henry, on the Dela- & Hudson R. R., which is reached by a drive of t twenty miles.

ere is practically no village at North Hudson, and a handful of houses, scattered for the most part at intervals along the road.

e last house in the little settlement before the woods reached at the north is Mrs. McAuley's, which has been headquarters for lumbermen and adventurous tsmen of a not over pretentious type.

e sportsmen have found Mrs. McAuley's entirely eir taste. The beds are clean and fresh and the table ; prices are moderate and there is plenty of hunting fishing territory on all sides open to the public.

ad hunted once before in the neighborhood, and was a stranger at Mrs. McAuley's when I drew up at her one evening early in the present October. My des- ion was an old lumber shanty three or four miles , on the slope of McComb, where I had camped the ious fall, and I expected to take up my quarters there following day.

An Accommodating Deer.

rs. McAuley received me hospitably, and treated me to unusually nice venison. At breakfast she explained the deer had been killed by the hired man. Her hter, Bird, who is, by the way, a devoted trout rman, was largely responsible for the venison. She seen the deer walking across the flat back of the e, and had called the hired man to get a rifle and run e place where they drew their water from the brook head it off. The hired man did as he was directed, he and the deer arrived at the water hole simul- ously, and though the man was no hunter, and had r before killed a deer, the shot was too easy to be ed, and he bowled the animal over within a few rods e kitchen door. The deer proved to be a dry doe cellent condition, dressed 175 pounds.

ad just left the breakfast table when a young man e by the front of the house with a small deer tied e back end of his buckboard.

He's going through to Keene with it," announced McAuley. "That same man carried through a big the fore part of the season, and he sold it to St. ert's Inn for $40. It was the first venison they had."

Lumber Shanties Burned.

e venison and the deer on the buckboard were good s, but a little later I learned a piece of news that like a dash of cold water. My horse had been put d I was ready to start, when one of the men about place volunteered the information that the camp e I was going had been burned.

he next one to it further west has been burned, too," the man. "I don't know who set 'em afire, or why it done, but you won't find any place to camp back in country unless you go to the Pepper's camp. They hay around that and stored it in the shanty, and dy's burned that one. It's on a State lot, and you've s good a right to it as anybody."

e news was depressing from more than one stand- , for aside from the inference which I drew that still- ers were not wanted and that the burning of the lings had a personal application, I realized the un- ant fact that I should have to camp in a poorer ing territory, the best part of an hour's walk from place I hoped to make headquarters. Except in ny weather there is not much use hunting in the ile of the day at this time just before the running mences, and I had counted on being on my hunting nd so that I could take advantage of the hours just after sunrise and before dark, when the deer are most apt to be on the move.

There was nothing for it, however, but to put up with an inferior camp, and about 7 in the morning I made my start for the Pepper shanty. The morning had been overcast, and about the time of leaving it began to rain in a gentle, soothing kind of way. My spirits rose again, for I knew that the rain was softening the newly fallen leaves and that the day would be all that could be desired for hunting.

The Cedar Point Road.

The first part of my route was along an old highway of travel that years ago was noisy with the shouting of teamsters and the creak of wagons. This was the old Cedar Point road that ran from the iron mines in the center of the mountain region to Port Henry, fifty miles away. There are men still living who have hauled ore over the road, but at the present time it has reverted to the wilderness, and only here and there are there portions where the old work has been preserved, either where an existing road follows the course of the former one, or where the lumbermen have cut away the trees and brush which contested for possession of the cleared space and utilized the grade for drawing in supplies.

Newer discoveries, such as those in Minnesota, where the ore can be taken with steam scoops from open cuts and loaded on the cars for twenty-five cents a ton, have forever made hauls like this unprofitable, and only the construction of a railroad will make it possible to mine this mountain iron again.

The old road was well graded, and only crosses West Mill Brook once in its lower course. There were no rotten bridges or dangerous corduroy to pass over, and the only inconvenience was the frequent brush and pole fences which obstructed the road.

At one place I drove into a flock of a dozen partridge feeding in the road, but they were wild, and I did not attempt to hunt them. An hour after leaving Mrs. McAuley's I was at the camp. I made a place in the shanty for the horse where I could leave him temporarily, and getting the supplies inside, started off for a little hunt in the direction of the burned shanties.

On the way I met a man looking for dogs. Stray dogs are common enough in the woods all through the hunting season. The divide between West Mill Brook, running east into the Schroon River, and Niagara Brook, running west into the Branch, is low and unimportant, and it often happens that the deer take the back track and cross over into the Branch, and the hounds are led off and lost. Sometimes, too, the deer have an aggravating way of running up hill and carrying the dogs over to Mud Pond or Clear Lake, thus giving their owners no end of trouble to look them up and get them back.

From the spot where I met the hunter to the site of the burned camps was only a short distance. The man had passed to one side of the clearing, but so close that if any deer had been in the neighborhood it seemed likely they would have scented him and made tracks.

However, I had hopes of the place, for it was on a favorite crossing for deer from the hardwood ridges on either hand, and, moreover, there was likely to be an attraction for them in the ashes of the burnt shanties which were likely to contain saline accumulations from the bottom of old pork barrels and the like.

Two Misses and a Hit.

Consequently, I made my way very cautiously as I approached the clearing where the buildings had formerly stood. Nothing was to be seen in the open space, which was not over ten or a dozen rods across, and I stepped out from the cover of the woods to get a better view of the place.

At the extreme edge of the space was a weed-covered embankment of earth which years before had been thrown up to keep the cold air from circulating under the shanty. The moment I came into view a small deer sprang from behind this, and before I could raise my rifle was out of sight behind a pile of charred logs. The glimpse was short, sweet, but unsatisfying.

With the picture still impressed on the retina, I became conscious that something else, living, was staring at me from behind the same bulwark of earth and weeds. The work of refocusing the eyes and readjusting the mental balance seemed to require a preternaturally long space of time, and while it was in progress I realized that this living entity was preparing to take flight as the other had done.

As a matter of fact, it probably did not take over a second to realize the fact that another deer had run up from some hollow behind which had concealed it, and that it had seen and sized me up and was stiffening the muscles of its legs for a jump. The gun reached my shoulder just as the deer started. I fired twice, but both shots missed. I was conscious that each in turn went behind, but it seemed impossible to swing the rifle fast enough to head the deer with the sights. I do not know how it is with other hunters, but with me I can only rise equal to unexpected chances like this on very rare occasions, when my reserve fund of nervous vitality is large, and when a certain something within me seems to move quicker than my dull senses, and the gun leaps to its place, is sighted and fired without any direct conscious agency.

Naturally I was disgusted with myself for losing chances at two deer. I did not blame myself so much for missing the moving deer as for not seeing the game first before it was alarmed by my presence. If I had gone a little more slowly and waited at the edge of the clearing I would either have seen the deer or heard them in course of time, but I had been too precipitous, and so lost my opportunity.

It is hard to realize always how low a deer stands, and how easily he may be hidden even in open ground by inequalities in the surface or even by tall grass. Whenever possible it is a good plan to get on an elevation and carefully study every foot of the ground before crossing open places in the woods.

While moralizing on my shortcomings as a hunter, I followed up the direction taken by the deer, and ascertained by the patches of torn moss and turned up leaves where they touched the ground in their 15-foot jumps, that one had crossed the swamp to the south, while the other had gone to the northeast, up an old road. I devoted myself to this latter deer, and at the end of half an hour I heard him moving, and caught a glimpse of his gray side a long way off through the woods. The deer appeared to be working back in my direction, intending, possibly, to rejoin its mate, and I remained perfectly still, awaiting developments. There was no wind, and the water-soaked boughs of the trees drooped motionless. The red squirrels and bluejays were at work, however, gathering in the beech nut harvest, and it was hard to tell which sounds were to be attributed to these smaller animals and which to the deer.

From the alarum notes of the jays along a little brook where there was a thick undergrowth of small balsams and hemlocks, I imagined they had sighted the deer sneaking by in that direction, and since, if he were coming toward me at all, the only cover was along the brook, I moved over a couple of rods to intercept him. From my new point of view I could see eight or ten rods along an old log road that crossed the brook, and felt sure if the deer was really coming toward me he would not escape unobserved. I watched quarter of an hour without any result, and then took out my lunch and began eating it. All the time I thought I could hear the deer moving around in the brush, but I could see nothing, and could only imagine that he was feeding slowly along.

Just as I finished my second slice of bread, as if by magic the deer's back appeared above a rank growth of swamp grass in the middle of the road, where I could have hit him with an empty cartridge shell. I whistled, and as he threw up his head I caught the sights on his shoulder, and a ball went through him quartering, touching the heart in its course.

The deer made half a dozen convulsive leaps, its tail raising and falling each time it jumped, and then fell, striking with its shoulder a rock weighing several hundred pounds, and knocking it out of place. The deer itself lay 10 feet beyond the rock, carried onward by the force of its last jump. It was a small buck, well favored and in good condition for eating.

Packing a Deer to Camp.

After dressing the deer and hanging him up in a nearby tree I continued my hunt along the side of the hardwood ridge. I saw no other game, however, and a little before 5 was back again at the spot where the buck was hung up ready to pack him in to camp. Letting the deer down to the ground, I enlarged the cuts at the gambrel joints and pushed the ends of the forelegs through the outer sides and pinned them with wooden skewers, and getting the deer on "piggy back" started for camp.

I had three miles to walk to camp, which I reached after several rests on the way to restore the circulation to my arms, half an hour after dark.

I stayed one more day at the Pepper shanty, exploring the ridges of Spotted Mountain and Buck Mountain. In this section of the woods there is a wonderful beech nut crop, and chipmunks, squirrels, jays, foxes, "saple" bear and deer are all busily at work, making the most of their harvest. Strangely enough, I saw very few partridge in the ridges, though they are abundant in the second growth at a lower elevation.

Bear signs were very numerous, and at the time of the first snows in November there should be a chance for still-hunting Bruin.

Two days ended my hunt in this section, and the morning of the third I moved on to a still rougher mountain country under the slides of old Dix at the headwaters of one of the branches of the Boquet River, which is on the St. Lawrence watershed.

At Mrs. McAuley's Again.

Mrs. McAuley was lamenting the price of potatoes and the unseasonable frosts that had killed her crops for the past two years.

"This year it was in August, and last year in July. You never can tell when one of these frosts is coming, and when they do come, they make a clear sweep and kill the buckwheat and potatoes right down to the ground. It's pretty hard on us poor farmers, and now that we have no hay the price of cattle has gone down. The papers say that beef has gone up in the city, but the buyers know that we haven't hay to winter our stock, and they pay us what they please."

"Never mind, Mrs. McAuley," I replied. "Anybody who's got a gold mine on their farm oughtn't to complain of hard times."

"Paper money'd suit me better," sniffed the lady rather contemptuously. "I don't take much stock in these gold mines that can't be seen with the naked eye, and that it takes a professor to explain. But it is real discouraging to have to buy potatoes."

It is popularly supposed that gold exists in considerable quantities in the sand which composes a large part of Mrs. McAuley's farm, and weight is given to these reports, by the fact that a man who is said to be a practiced prospector and mine owner has bought the place adjoining on the east and talks of purchasing the one on the south as well. This man spent several months prospecting in the neighborhood during the summer, and apparently found promising indications of some mineral, but native report would indicate that it was iron or copper, rather than gold, though, as a matter of fact, there is little doubt that gold does exist in small quantities all through this section.

Cheap Mountain Homes.

In this connection prices paid for property along the post road may be of interest. For a man who wants a cheap summer home the locality is ideal. The George Shaw place, which is said to have been purchased by the mining man, was bought, according to my informant, for $500 cash down and $300 on mortgage. It consists of 300 acres of meadow and mountain land, and includes a beautiful wooded hill. On the east it is bounded by the river which is an opalescent trout stream, and on the south by the road. There are four buildings on the place, including a roomy two-story dwelling in a fair state of repair.

The little place adjoining the McAuleys' on the south was for sale for $150. I do not know the quantity of land or the condition of the house, but my impression is that the latter was a dilapidated shanty that would hardly pay for repairs.

A mile and a half beyond Mrs. McAuley's is the old

Sharpe place, reached by fording the river. This was once a fine old house, with great open fireplaces, full of odd nooks and corners, and the surrounding country was the delight of some artists who accidentally stumbled on the place ten years ago. The building was at that time occupied by Mrs. McAuley. Since then it has reverted to the State for taxes. The place is at the entrance to a noted hunting valley, and nearby are several small lakes.

North Hudson has seen beter days in years past. All over the town are ruins of saw mills and forges and other forgotten enterprises. At Deadwater is a little settlement that but for the Canuck squatters would be a deserted village. Last year when I passed the place the school house had been given up to pigs and chickens.

J. B. BURNHAM.

CHICAGO AND THE WEST

"Life in the Far West."

CHICAGO, Ill., Nov. 2.—My friend—and I shall call him my very dear friend—Mr. Horace Kephart, librarian of the Mercantile Library, of St. Louis, has sent me another book on the West, that great West of the old times toward which all Americans still turn with interest. There may be some news in the story of this book; for the term news is an odd and contradictory one. Nothing is really news if it is more than a day old, or unless upon the other hand it is half a century or so old. In our busy to-day we are forgetting rapidly our different yesterday, and to be told of it sometimes excites surprise and interest.

This particular book is called "Life in the Far West," and it was written by George Frederick Ruxton, published originally in 1848 in Blackwood's Magazine, and printed in book form by William Blackwood & Sons, Edinburgh, Scotland, in 1849. Ruxton was a young English army officer, and he died at St. Louis, in America, when he was but twenty-eight years of age. His life was in many respects a remarkable one, and he wrote one of the most remarkable books about America which ever was done by an Englishman; so fair, so appreciative and indeed so lovingly enthusiastic a book that he might have been himself American-born. Indeed, Ruxton was a man too great to belong to any one country. He belonged first of all to the great craft of lovers of nature, of observers of outdoor life—in short, the guild of sportsmen. To belong to this guild is indeed to be cosmopolitan. Hence Ruxton's book is a very different affair from that of Sir Richard Burton, who once traveled across our Western country, and very different from those numerous recountals of wholesale butchery in the American West with which other wealthy Englishmen have sought to place the laurel crown of glory upon their own shrinking brows. Mr. Kephart tells me—and Mr. Kephart's word on all books pertaining to the West I esteem to be the most valuable and conclusive of any in America—that he considers Ruxton's book one of the most faithful and valuable writings extant on early Western life, He deplores only the bloodthirstiness and crudeness in which Ruxton revels while describing his Western trappers, regretting that he did not find place in his pages for some of the gentler but not less courageous characters of the West at that early day.

But Ruxton was young—very young to have done what he accomplished before his untimely death. He was only seventeen years of age when he left the military school of Sandhurst and joined the Spanish army in order to learn of practical warfare. Then he received a commission in the Eighty-ninth Regiment of the English Army, and was sent to Canada. Now he was upon the American frontier, and all the sportsman, all the primeval man in him went into mutiny. He quit the army as too tame, and drifted to the Missouri River as naturally as the Missouri River runs to the sea. This, we may remember, was in the time of Kit Carson, of Old Bill Williams, and of Old Bill Hamilton, who was then Young Bill Hamilton. Bent's Fort and Taos and Santa Fé were then the salient points on the Western trail. The great Mormon migration had not yet begun. In short, all the grand old West was still the West, fitting country for such men as Ruxton, who understood and loved it. Nor did Ruxton ever forget the West. In 1845 he tried exploring Africa, making foot journeys in North Africa and Algeria, and later attempting a journey across Central Africa, which, however, failed. Then he explored Mexico, and wrote a book about that country. He contemplated a voyage to Borneo, and was asked by the Aborigines Protection Society of England to go to Canada to "organize the Indian tribes." Of these many enterprises, Ruxton naïvely says, expressing a feeling which I doubt not many of us have shared with him, "For my own part and inclination I wish to go to all parts of the world at once!" Now observe, this youth had the whole world to choose from, and again, even as the Missouri runs toward the sea, he gravitated toward the Missouri, and toward that country which I conceive to have been the most estimable for a man that the whole surface of the great round earth has ever seen. Here is what he says about it:

"Although liable to an accusation of barbarism, I must confess that the very happiest moments of my life have been spent in the wilderness of the far West, and I never recall but with pleasure the remembrance of my solitary camp in the Bayou Salade, with no friend near me more faithful than my rifle, and no companions more sociable than my horse and mules, or the attendant coyote which nightly serenaded us. With a plentiful supply of dry pine logs on the fire, I would sit cross-legged, enjoying the genial warmth, and, pipe in mouth, watch the blue smoke as it curled upward, building castles in its vapory wreaths, and in the fantastic shapes that it assumed, peopling the solitude with those far away. Scarcely, however, did I ever wish to change such hours of freedom for all the luxuries of civilized life; and unnatural and extraordinary as it may appear, yet such is the fascination of the life of the mountain hunter, that I believe that not one instance could be adduced, of even the most polished and civilized of men, who had once tasted the sweets of its attendant liberty, and freedom of every worldy care, not regretting the moment when he exchanged it for the monotonous life of the settlements, nor sighing, and sighing again, once more to partake of its pleasures and allurements."

There is a very true ring to the above, nor is there any counterfeit or affectation throughout the book, neither any show of prejudice and superciliousness. The man is in love with the West, and the spirit of the West, with the environment and the characters which that environment had produced. Giving up all his other plans, he headed once more for the Missouri and the Rockies, over the old Independence trail, writing thus from London just before he started: "Human nature can't go on feeding on civilized fixings in this big village, and this child has felt like going West for many a month. My route takes me via New York, the lakes and St. Louis, to Fort Leavenworth, or Independence, on the Indian frontier. Thence I strike the Santa Fé trail to the Arkansas, away up that river to the mountains, wintering in the Bayou Salade, across the mountains next spring to Great Salt Lake—and that's far enough to look forward to—always supposing my hair is not lifted by Comanche or Pawnee on the scalping route of Coon Creeks and the Pawnee Forks."

This was written after he had completed his book, but, poor boy, he never saw the Rockies again. Taken ill at St. Louis, he died in the fall of 1848. This was two years after Iowa was admitted to the Union, and it was six years before my own father moved out into Iowa, which has always seemed to me as having been a thousand years ago, and at the very beginning of the world. It was wild enough when my father crossed the plains to Denver, when Denver was a village, but how much wilder must have been the West-bound trail when Ruxton traveled it. Nowadays we cross that country by steam, and we pay a guide a thousand dollars to show us some footprints of game in the valley where Ruxton sat cross-legged before his fire!

I have been so much pleased with Ruxton himself that I have little space left for Ruxton's book. It is a wild book—what we might call a woolly book. The dialect of the mountain trappers is something different from anything in American literature, and indeed I think it tinged with the English idea of what the American dialect should be, as see Charles Dickens and Sir Richard Burton. The sturdy character of the American hunter and trapper is there, however, and I presume no better picture exists than these descriptions of the life lived by the white frontiersmen among the Indian tribes. It is nothing for a trapper to have an arrow pulled out from his body, to have the wound staunched with a pad of beaver fur, and then go on about his business as though nothing out of the ordinary had happened. Ned Buntline at his best, or worst, never imagined Indian fights more bitter and bloody than these which Ruxton's characters actually saw. The killing of big game is a matter of course, and the whole action of the book is occupied with nonchalant big deeds.

Most of us can learn of the old West only through books such as these, and I wish the book were more common, so that it might more easily be obtained. The plan of the book is that of a loosely constructed story, but the author declares that the characters are not fictitious. He mentions Kit Carson, but does not bring him into the story. Killbuck I do not know, nor La Bonte, but Bill Williams is introduced in his proper person, and this is what the author says of him:

"Bill Williams, that old 'hard case,' had spent forty years or more in the mountains, until he had become as tough as the parflèche soles of his moccasins. He rode ahead, his body bent over his saddle horn, across which rested a long, heavy rifle, his keen gray eyes peering from under the slouched brim of a flexible felt hat, black and shiny with grease. His buckskin hunting shirt, bedaubed until it had the appearance of polished leather, hung in folds over his bony carcass. * * * In the shoulder belt, which contained his powder horn and bullet pouch, were fastened the various instruments essential to one pursuing his mode of life. An awl with deer horn handle, and the point defended by a point of cherry wood carved by his own hands, hung at the back of the belt, side by side with the worm for cleaning the rifle; and under this was a squat and quaint-looking bullet mould, the handles guarded by strips of buckskin to save his fingers from burning when running balls, having for its companion a little bottle made from the point of an antelope horn, scraped transparent, which contained the 'medicine' used in baiting the traps. The old coon's face was sharp and thin, a long nose and chin hobnobbing each other, and his head was always bent forward, giving him the appearance of being humbacked. He appeared to look neither to the right nor to the left, but in fact his little twinkling eye was everywhere. He spoke in a whining, thin, cracked voice, and in a tone that left the hearer in doubt whether he was laughing or crying."

The foregoing is the fullest description I have ever read of Bill Williams, though I do not know how accurate we may call Ruxton's account of the death of Williams, regarding which I have understood there is some divergence of opinion. Ruxton described Williams as being found dead in a solitary camp, sitting upright against a tree, frozen quite stiff, with a wound in his chest which might have been the cause of his death. This he says was in a "wild cañon near the elevated mountain valley called the 'New Park.'"

He who reads Ruxton shall hear of the "Yellow Stone," of the "Soda Springs," of "Eustis Lake" and of other places which may be within the bounds of what is now Yellowstone Park. The South Pass of the Rockies, the desert trails of California, and all the famous localities of the Rockies, under names, perhaps, now forgotten, shall appear, and there shall be full story of the old-time trappers' rendezvous. Let me add what he says about these historic metings of the trappers:

"Here were congregated many mountaineers whose names are famous in the history of the far West. Fitzpatrick and Hatcher and old Bill Williams arrived with their bands; Sublette came with his men from the Yellow Stone, and many of Wyeth's New Englanders were there. Chabonard, with his half-breeds—Wah-keitchas all—brought his peltries from the lower country; and half a dozen Shawnee and Delaware Indians, with a Mexican from Taos—a fine, strapping fellow—one Marcelline. Here, too, arrived the 'bourgeois' traders of the 'North West Company' with their superior equipments, ready to meet their trappers and purchase the beaver."

Those are names not familiar to all of us, though I take it they were engraved upon the history of the West more deeply than many of ours will be.

I know I ought to quit quoting from this book, but it is hard to break away from it. Perhaps I may be successful in the attempt to drop it after telling how they butchered buffalo in those days when there was buffalo to throw away. This is how Ruxton says it was done:

"They turned the carcass on the belly, stretching out the legs to support it on each side. A transverse cut was then made at the nape of the neck, and gathering the long hair of the boss in one hand, the skin was separated from the shoulder. It was then laid open from this point to the tail along the spine, and then, freed from the sides and pulled down to the brisket, but still attached to it, was stretched upon the ground to receive the dissected portions. Then the shoulder was severed, the fleece removed from along the backbone, and the hump ribs cut off with a tomahawk. All this was placed upon the skin, and after the 'boudins' had been withdrawn from the stomach, and the togue, a great dainty, taken from the head, the meat was packed upon the mule and the whole party hurried to camp rejoicing. Far into the still watches of the night the fat-clad 'depouille' saw its fleshy mass grow small by degrees and beautifully less before the trenchant blades of the hungry mountaineers."

We do not butcher our buffalo in just that way to-day.

A Good Game Season.

CHICAGO, Ill., Dec. 2.—We are having a mild and very late fall in this vicinity this year, and according to the weather prophets we are to have a mild winter. At this time last year the weather was cold and the ground frozen, and all over a good part of the Northern country there had been heavy and destructive snow storms. We have hardly had any freezing weather here about Chicago this fall, and the weatner continues mild and cloudy with more semblance of rain than of snow. Of course such conditions are very favorable to the small game of the country and make toward a good supply of game next year, provided that we do not reach a season of crusted snow later on in the winter. Our quail stand cold weather pretty well unless the snow is very deep. The worst thing for them is rain or melting snow followed by a sudden hard freeze. It is to be hoped that the weather prophets are correct, and that we are to have favorable weather this coming winter. Directly about Chicago, we have had no snow as yet, but down in Indiana two or three weeks ago they had a good tracking snow, and this fact was a very unfortunate one for the quail. The local shooters turned out en masse, and it is reported that the slaughter caused by the flock hunters was very large. When Bob White leaves his record on the snow, he is increasing his natural enemies and decreasing his natural resources of defense a hundred fold. Some of our shooters who were down in Indiana just after the snow declared that the game over a large section of the country was pretty nearly cleaned up by the flock shooters.

The Deer Season.

The general trend of advice in regard to the deer season in Wisconsin and Michigan this fall is to the effect that the hunting was not very good. It was a dry fall and the still hunters had hard times. I do not think the total number of deer kiled was up to that of last year, and I am disposed to believe that the practice of hounding was not so generally followed in violation of the law. Friends at Northern points tell me that the trains which formerly carried numbers of hounds into the woods at the opening of the season, this year had almost no dogs at all. I should think it fair to suppose that next season will show the deer not very much cut down in numbers, though of course less than annual toll of the rifle-bearing muscallonge fishers.

If deer hunting in our pine woods has this fall been less sanguinary than usual so far as the deer are concerned, it has been fully up to the average of earlier years in disastrous consequences to the hunters themselves. The story of the deer hunting casualties in the East has been pretty fully made up, and the reports from Maine and the Adirondacks read as though they came from South Africa rather than from America. Information of this kind is difficult to collect in the West, because we do not have so accurate a system of check on our hunters as they have in Maine and the Adirondacks, and of course all news of this nature is kept out of the paper as much as possible by those most concerned in such accidents. I see it stated, probably largely on hearsay or on guess, that twenty-three persons were killed in the Adirondacks. On equally loose authority it is stated that six deer hunters were killed or fatally wounded in Wisconsin and that four men were killed in Michigan. A dispatch from Marquette, Mich., bearing date of Nov. 30 reads as follows:

"The deer hunting season just ended resulted in a total of eleven hunters being killed and seven wounded in the Michigan and Lake Superior sections of Wisconsin and Minnesota. Most were mistaken for deer. A few were shot through their own carlessness."

Mr. George F. Winslow, of Eau Claire, Wis., tells me that he heard of four hunters who were killed in upper Wisconsin this fall. He tells me that sometimes the deer hunters go out in such numbers that it is more like a company of soldiers than a party of hunters. He says the firing at all sorts of things was incessant, and it was dangerous to be in the woods. He saw one party of fourteen hunters who went into camp, and he saw one railroad coach packed full of deer hunters who had come up together from Indiana. While he himself was in camp shooting ducks there were three camps of deer hunters who came in and pitched their tents near him, two parties of six each and another of four. He heard these hunters shooting a good deal, but did not learn that they killed any deer or men.

Mr. Winsliow says that Eau Claire is one of the greatest entering points of the Northern deer country and a great many hunters pass through that city on their way in and out. While he had no means of accurately estimating the number of deer in the country tributary to Eau Claire, he saw a great many loads of deer on the way out of the woods and shipped through Eau Claire. Mr. Winslow says frankly that the Eau Claire hunters do not use dogs any more in their deer hunting. They formerly did so, but a number of years ago a number of the leading citizens of Eau Claire got arrested for hunting deer with dogs, and it cost them each about $200 before they got through. They no longer counsel that method of killing deer.

Mr. Otto Tosetti, of this city, had good fortune in his cent deer hunt in the Michigan north peninsula. He me across two bucks which were engaged in mortal mbat, three does standing by some 30 yards distant. r. Tosetti uses a .25-cal. Winchester, and with this little eapon he managed to kill both of the bucks on the spot. e is now having their heads mounted here in Chicago.

Mr. Fred M. Stephenson, of Menominee, Mich., is one the best all around sportsmen we have in the West, and e fall which went by without his having a deer hunt ould be a very dull one for him. He was lucky, as ual, this fall, and on one day killed three deer within ss than five minutes, in one of those rare streaks of od fortune which now and then befall a hunter. Mr. ephenson, by the way, is in Chicago to-day, and if I ceed in catching him I am sure to get some thrilling ories.

Mr. Alfred S. Laflin, of this city, is just back from his dge in the Manitowish country of Wisconsin, where he d his wife have been hunting deer together. Both Mr. aflin and his wife were fortunate, and each secured a od head.

Quail.

I have not heard this week of any more of the phemenal bags of quail such as were reported last week, t I am confident the shooting has continued very good. ery many shooters are out on their Thanksgiving hunt, d of course even the Thanksgiving rabbit hunters will n across their share of quail. Every one tells me that ere is more and more land being posted in Indiana, so at good shooting territory is harder than ever to get to. This sort of thing no one should regret to hear, as ery posted farm is a game preserve. I hear that Neoga, l., is the place where Drs. Carson and Miller made their eat killing of quail. Mr. Oswald Von Lengerke left sterday for a quail shoot at Wheatfield, Ind., where he pes to have some success. He was at Monterey, Ind., rlier in the season, but was rather disappointed with e shooting there, although this is ordinarily very good ail country.

My friend Elmer Bliss, of Saginaw, Mich., says that he s been out with his friend Mr. Baird, at points which think are along the Grand Trunk Railway, and in two ys the two guns killed twenty-seven partridges and six ail.

A very sad accident happened near Grand Rapids, ich., on Nov. 27. Gen. Israel C. Smith, of that city, hile out quail shooting in some manner entangled his n in the brush and accidentally shot himself through e head, with the result of instant death. Gen. Smith as sixty years of age, a Colorado pioneer, a soldier in e Civil War, a brigadier-general in the National Guard d a very prominent man in the affairs of his native city. e has a son, Lieut. Fitzmorton Smith, in the regular my, who is now at Manila. The sportsmen of Grand apids are much distressed at this occurrence.

Speaking of quail and quail shooting reminds one of e steady growth in importance of this bird in our Western shooting plans. Little by little, and more and ore every year, Bob White continues his northward arch, following the little farms and the slashed-off lumering country. I fully expect to see this bird as far rth as the shores of Lake Superior. Thus a well-known tizen of Eau Claire, Wis., Mr. George F. Winslow, tells e that twenty years ago, when he first went to Eau laire, there were no quail at all, and he lived there for ve years without seeing any of these birds. There are ore now than were ever known before, and Mr. Winsw mentions one bag of twenty-seven quail made by two ns this fall near Eau Claire. He says that the birds are ry hard to bag in that neighborhood, as a bevy once ut up at once heads for the nearest thicket, and that ountry is full of swamps and heavy cover. As Eau laire is not the northern limit of the quail by any eans, it may be seen how distinct is this northern exnsion of habitat on the part of the quail, evidence of hich is common in the reports of numbers of quail in ther parts of Wisconsin and Minnesota in recent years.

Ducks.

The mild weather has kept the ducks lingering in this titude very late this fall, and although the flight is of ourse gradually working South, we still have shooting n such of our marshes as can furnish feed and water. hear that there are still some mallards hanging around ox Lake, and also along the timber streams of Iniana. I should not be surprised to hear of good sport et at the Swan Lake Club, on the Illinois River.

The new non-resident license law of South Dakota unettled the plans of a good many shooters who had been n the habit of going out there. We may instance one arty of Wisconsin gentlemen who formerly shot at Dry ake, near Watertown, S. D., and who last fall killed ver 1,500 ducks there. Although these gentlemen have eir boats, decoys, etc., stored at Watertown, they did ot go out at all this fall. They said the law had grown to e too strict, what with a shooting license, a twenty-five-ird limit and a clause prohiibting the taking of game ut of the State. This latter clause I myself consider to e the most unjust one to be found in any of our game aws, and I have been told by former wardens of Wisonsin and Michigan that they would never take up any ase against shooters who were taking game with them nd not using it for market purposes. This clause of the ndiana law, as was reported long ago in these columns, as shown to be invalid, and shooters have always rought their game out from that State without giving he matter any thought.

Very often shooters who go out to the far West after ucks overlook better things close at home. Thus I may ention the good fortune of Messrs. George F. Winslow nd Charles Smith, of Eau Claire, Wis., who shot this all at Bear Lake, only sixty miles from home, and who ad very good fortune. They killed seventy mallards and bout forty or fifty redheads and other ducks in the course f four days. Bear Lake has a rice bed of about 2,000 cres, and this fall it had large numbers of wildfowl feedng there.

Woodcock.

The woodcock seems to be growing very scarce in this art of the West. About the best woodcock ground we have in this region was along the low country near Trempeleau, Wis., on the Mississippi River. The Beef Slough country of the same district was formerly very good. This year the woodcock crop seems not to have been so good as usual, and a bag of six birds is the best of which I can learn.

Buffalo.

It seems that we are to have some buffalo meat offered for sale in Chicago in this coming holiday season. Mr. D. F. Carlin, administrator of the Dupree estate, of Pierre, S. D., is reported to be preparing to kill several buffalo out of the Dupree herd, stated to be held on the Cheyenne River. The carcasses will be shipped to Chicago for retail at fancy prices. It will probably be the first buffalo meat seen here for some years.

Indians.

Mr. Thomas R. Roddy in the winter lives in a flat in Chicago. In the summer time he lives in a wickiup with the Winnebago Indians, of which tribe he was elected chief. Mr. Roddy has just returned to Chicago, and he says that next summer he will take to the Paris Exposition a party of fifty Indians recruited largely from the Winnebagos, with representatives from other Western tribes. Mr. Roddy is said to have the finest collection of bead belts in the world, and he purposes putting this collection on exhibition here before long.

Big Bass.

The two biggest bass which I have seen this year are shown mounted at Von Lengerke & Antoine's here. One of these was taken by W. A. Sharp in the Lauderdale chain. It is a big-mouth and weighs 5 pounds 15½ ounces. A yet larger bass is that taken by Mr. H. E. Wiley, of this city, also a big-mouth, which is reported to have weighed 8 pounds. It is a shapely fish, and I should take it to have come from the Madison Lakes, although I do not learn where this fish was caught.

Big Muscallonge.

One of the finest muscallonge which has come into Chicago this season is that shown mounted at the transfer office of F. Parmelee, a handsome fish, stated to have weighed 42 pounds and to have been taken near Minoqua, Wis.

Pine.

Col. J. S. Cooper, of this city, was in Washington, D. C., this week, as enthusiastic as ever over the Minnesota National Park idea, and he reports that there will certainly be a bill introduced in Congress this winter for the establishment of this park.

Meantime, the medical men of Minnesota continue their determined movement to save the standing pine of the Leech Lake country. They purpose forming an organization to purchase and leave standing this pine timber, it being their idea that this is the best health resort in the Northwest and should be maintained as it is. Among the medical men prominent in this work are Drs. H. M. Bracken, L. M. Crafts, R. O. Beard, J. W. Bell, J. H. Dunn, J. T. Moore, A. W. McDonald, George Eital and F. A. Gunsmore, of Minneapolis, with Drs. A. W. Gunning and C. L. Green, of St. Paul. It is sincerely to be hoped that something will come of this movement.

The South.

News comes from the famous and favorite sporting locality of Rockport, Tex., that the Gulf Coast in that vicinity has within the week been visited by the severest storm ever known there. Great injury was done among the small shipping, and anxiety was expressed for hunting parties out in schooners along the coast. Ex-Mayor Holland, of St. Louis, and Mr. E. H. Green, president of the Tarpon Club, of Aransas Pass, were among those out in schooners at the time of the storm; but as no disaster to their craft is reported at this date, it is to be presumed that they made port safely.

Mr. D. Flowerree, of Helena, Mont., is in Chicago this week on his way to his winter home at Fort Meyer, Fla. As index to his intentions with the quail, etc., it may be stated that Mr. Flowerree has purchased in Chicago more than $100 worth of shotgun ammunition.

My friend Mr. Fred Merrill, of Milwaukee, writes me that he and his brother Dick will soon start South on their regular winter hunting trip. Among other things Mr. Merrill goes on to say:

"We hope to migrate to the Texas coast very soon to try and shoot a few ducks. Don't expect to quarter our fall Dakota hunt (the best in fifteen years, especially on mallards). We will meet Jim Bludworth, and he and our man will sail his new boat, just built this year after his own practical ideas for cruising in shallow water along the coast. How long we will stay with him depends entirely on how good the duck shooting pans out. Have sent down quite a bunch of reds and sprigs or "tin pail" decoys, and if we get a duck for each decoy we will have several days' good shooting. If duck shooting is poor I will go to Los Angeles, Cal., and vicinity. Dick will probably stay by Texas, as he likes the room and freedom of Texas better than the glorious climate of California. He is a little sore on Florida, and thinks it is a land of frozen oranges and broken promises on ducks. Dick prefers a good blind and a good duck flight to doing the hotel piazza act in a gameless country.

"If I do go to California I will not do a great deal of shooting. It will be a case of some fishing, mostly golf, tennis, riding and driving, same as last winter. I am a little afraid of golf—played it long enough to find out that it is a dangerous game for a single man who is fond of freedom and shooting. With the right partner a man is liable to lose interest in mallard flights, 11 gauge wads, chilled shot, pattern and penetration. My trip is liable to be a miscellaneous one. Among other things I will take a pair of waist-high waders and a head waiter's suit for modern life, and will try to get some fun out of whatever is going on."

Mr. Merrill's fears are well grounded. Let me beg him to be very careful about golf, especially to eschew the golf girl.

Which is Called Didymus.

I have read with much interest the comment on "big bags of ducks" which appears in last week's FOREST AND STREAM over the signature of that entertaining writer who signs himself Didymus. I imagine that most of us practically agree with Didymus in the matter of big bags of game, yet the duty of a newspaper man is to make known the facts. I take it that the accounts as printed were actual facts, though it is only strictly accurate to say that the news was obtained from friends of the shooters and not directly from the shooters themselves. Sometimes when you go directly to headquarters you don't get any news at all about such things. Both of the gentlemen criticised are good friends of mine, and although that does not set up sanctuary for them, I am inclined to believe that did Didymus know them both he would have stayed his hand. I do not absolutely know that Mr. Howe killed sixty birds all in one day, but I will say that if any club shooter ever earned the right to do so, then that man is Mr. Howe, for a more lovable soul never stood on earth. Mr. Howe is an old man—a very old man—and he led the Tolleston Club in their long, plucky, expensive fight in the interest of reputable sportsmanship on the fateful Tolleston Club grounds. These gentlemen have never made any bluster, and you never hear them speak of their lawsuits or their bags of game. Indeed, I presume they would rather that both were kept out of print, whether the one or the other be small or large. Abner Price is a younger man than Mr. Howe, yet still past middle age, and as fine a fellow as ever was. I would not say anything for or against him, because he is stout and husky; but the man who raises his voice against F. A. Howe raises it against all Chicago. Neither Mr. Howe nor Mr. Price would make any reply to comment of this sort, yet I should not be surprised were Mr. Howe reported incorrectly, as the Tolleston bags are secret things. I give the news because I am a newspaper man.

As to Didymus' statement that all duck clubs ought to have a limit to the daily bag, I agree with him perfectly. I stood out for a long time for a limit in the Horicon clubs, and that was finally established, much to the detriment of one or two local members who were shooting for the market under cover of a club membership. The Wauponaca Club, of Memphis, Tenn., has a limit of fifty birds per day. I think such a daily limit should depend largely upon the conditions, and be better determined by those advised of the conditions than by us, who must pass upon the thing off-hand. Personally I do not care to kill more than twenty-five birds per day myself, limit or no limit; but perhaps every one does not feel just that way himself. Indeed, I think that Didymus and I will preach a long while to ears more than partially deaf. The task is that of reconstructing human nature. "Do you suppose?" asked a friend of mine the other day, "that I am going out into Dakota and pay all the expenses of the trip, and pay a license fee on top of that, and then not kill more than twenty-five birds a day? Certainly I will not; but I will go to where I can get some show for my time and money."

This is much the story of the average shooter. It is so rarely that he gets an opportunity for sport that he finds it hard to stay his hand when the occasion comes. It is human nature which is cleaning out the American game. I presume I have done as much writing against excessive slaughter of game as anybody, but I could never see that it had much effect. The sort of news to print in a sporting paper—the sort of news which attracts the attention of everybody, Didymus included—is news about good game country and good bags of game. I have much distaste to say it, yet I do believe that if the circulation of the FOREST AND STREAM were confined to good people like Didymus and myself, who sincerely are opposed to slaughtering game, and sincerely in favor of a daily limit to the bag, the aforesaid circulation would be but a tithe of what it is to-day. Does Didymus shoot? Was he ever on the marsh when the flight was on and the birds were working well? Is he a good clean shot? Does the blood run pretty hot in his veins? My faith, when I begin to ask these questions of myself, I can remember chiefly that part of my childhood's prayer which says: "Lead us not into tempation."

E. HOUGH.

480 CAXTON BUILDING, Chicago, Ill.

The Kaiser at Windsor.

Editor Forest and Stream:

A New York daily, referring to the hunting trip of the Kaiser and the Prince of Wales in the Windsor preserves, after detailing the numbers and kinds of game killed, viz., 178 pheasants, 1 partridge and 328 rabbits, goes on further to state that the Kaiser used a magazine Mauser rifle.

It is fair to assume that out of kingly courtesy the Kaiser was allowed to kill practically all the game. But he did so, if properly reported, with a .30 smokeless rifle. Now did he do it? If the pheasants were "treed" perhaps he blew their heads off one by one. As to the rabbits, they do not tree when a dog barks, but on the other hand run like the very devil, and not always in the open either. Therefore, if we credit the Kaiser with blowing off the heads of his pheasants, we on the other hand must realize that the rabbits were killed while hustling through the cover. It may be well enough for Buffalo Bill, Dr. Carver and Annie Oakley to knock glass balls to smithereens with shot cartridges, but when it comes to knocking over skyrocketing pheasants and balls of fur, going through the brush like a streak of lightning, with a rifle ball, it's time our Yankee rifle experts "took notice."

CHARLES CRISTADORO.

ST. PAUL, Minn., Nov. 25.

It has long been a mystery how the young of the Australian duckbill (or duckbilled Platypus, as it is often called) succeed in obtaining milk from their mother. In this peculiar creature the female is unprovided with teats, the milk glands merely opening on the surface of the breast by a number of minute pores. Quite recently an observer has found out that when the young duckbills want to suck the mother throws herself on her back, when her offspring mount upon her breast and press the apertures of the milk ducts with their beaks. The milk thereupon commences to flow and is received in a groove on the breast of the parent, from which it is scooped up by the beaks of the young ones, just as ducks ladle up the water out of a ditch.—R. Lydekker.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

"'Way Down in Ole Varginny."

'Way down in "ole Varginny" I have had some experiences lately which perhaps may be found entertaining by such of your readers as are interested in that particular region.

My friends H. and B. had been there for nearly two weeks, and one fine morning (which seemed to lure one to the woods) I suddenly determined to join them. After a delightful sail by the Old Dominion Steamship Co., and an instructive if somewhat tedious railroad journey, I reached my destination as the sun was going down.

H. and B. were afield, so I lit my pipe and strolled into the woods back of the hotel. Here all was peace, but presently the stillness was broken by vocal strains which, if all untrained, were some of the sweetest I think I ever heard. My curiosity was excited, and taking my way in the direction whence the singing proceeded I came upon a darky woman washing in a stream. When she became aware of my presence she stopped her vocal exercises, and upon my complimenting her showed all her teeth in a grin which was half satisfaction and half embarrassment. Returning to the hotel, I met H. and B., and we agreed to make an early start next morning, as it was to be their last and my only day. Being tired after my long journey, I requested one of the boys about the hotel to call me, fearing I might oversleep myself. He promised faithfully to do so—but do you think he kept his promise? Bless you, no! Nor did he exhibit the least guiltiness on my next confronting him—merely laughed, as if it were a good joke. However, despite the remissness of Sephus (which was the young delinquent's euphonious appellation), I was up betimes, as were H. and B.

Swallowing a hasty breakfast of the staple ham and eggs, we started for the scene of our hunting, which was ten or twelve miles away. The morning was quite foggy, and the sun had a long struggle before it effectually cleared the air. Our progress through the woods was fairly rapid, considering the nature of the roads, with which, as my friend H. expressed it, the rocky road to Dublin was not in it. Half a dozen times at least I thought the trap was going over, but somehow we managed to escape. By 10 o'clock we had reached our objective point, a farmhouse on the brow of a hill. The fog had completely disappeared, and the sun was shining brilliantly, bringing out all the glories of the autumn woods—and what glories these are in Virginia! When the horses were unhitched and all was ready, I lined up with H. and the guide, and B., producing his camera, took a snap shot of us. Then we set out in quest of the birds. We had gone only a few hundred yards, when a covey was flushed. Bang! went the guns, and down fell two birds to B., the others scoring 0. The dogs worked about for a while, flushing another covey—or part of the first at least—which gave more opportunity for burning powder, with renewed additions to our bag. Everything promised beautifully, and we were in a high state of elation. Following up the birds which had escaped, we got into the woods; but here, alas! our hopes were all on a sudden blighted, for an event befell which practically spoiled our sport for the day.

H., seeing how his young dog was contracting the bad habits of the guide's brute, swore that he would not have his dog spoiled—no, not for a thousand birds or two thousand five hundred birds—and requested that the brute be chained up or held in leash (as it appears he had been on previous days), whereupon the guide got on his high horse, refused to comply and left us. At first we did not quite realize our position, but gradually it dawned upon us. There we were on the edge of a wilderness, or so at least to us, and to attempt to "go it alone" was to insure our being lost. When we had realized this we moped about for a while (keeping the farmhouse well in view, you may be sure!), and then in sheer desperation began calling for the guide. How B.'s organ voice echoed through the stilly woods! But no answering voice was heard, nor did any guide appear. The crickets sang on, the crisp leaves glistened in the sunlight, and a solitary buzzard hovered in the sky. Discouraged and despondent, we returned to the wagon, and it being now 12 o'clock ate our lunch in grim silence. The loss of the day's sport was bad enough, but what if the guide should not turn up even to take us home? While we were cogitating thus, lo! out of the woods walked the offended one, and leisurely stows his gun away in the wagon. B. asks him a few questions as to where he had been, and he answered somewhat distantly, "Down dar," pointing in a certain direction, and added nonchalantly that he had flushed six coveys of quail and a flock of wild turkeys! Imagine our feelings! Was it any wonder that H. forgot all his pride and went up to that guide and apologized to him. As I witnessed the scene my emotion was such that tears almost welled to my eyes. But will it be believed, at least outside the South?—the guide stood obdurate, absolutely refusing to go hunting with us again. Yea, though B. and myself added our solicitations to H.'s. Talk of the latter's pride in comparison with this! But what was to be done? That was the question. H. had a happy thought. "Suppose," said he, "we inquire at the farmhouse; perhaps they have a boy or some one they could let go with us. No sooner said than done, with the result that a darky boy was procured who averred that he knew every inch of the woods. Much satisfaction on our part, and casting sidelong glances of triumph and scorn at the guide, who sat nursing his pride at the root of a tree, we shouldered our guns and marched off.

But here, methinks, I had better bring my narrative to a close, for sport again, in the proper sense of the term, we had not. A few coveys were casually flushed and a few birds knocked down, but that was all. Our little nigger guide did his best, certainly—his smiling best—but that consisted merely in keeping us from getting lost. As for finding birds, he could as soon have found the North Pole, poor dusky little chap. However, we had some interesting experiences in the woods—those rare old Southern woods, which afford a naturalist a splendid opportunity of gratifying his curiosity. As night began to gather, we made our way back to the starting point, and found the "enemy" with the horses hitched, and very pensive and quiet, as if he had been taking counsel with himself and "mourning the hopes which left him"—in respect to a bonus, that is. Another drive over the eccentric road, with numerous hairbreadth escapes, and home was reached as the moon was rising solemnly over the pines. Needless to say there was no change of menu, but, pshaw! had the ham and eggs been nightingales' tongues they could not have been more enjoyed. Why don't dyspeptics go a-hunting?

The next day we took our leave, and as the train drew out from the station what think you we saw?—a wild turkey flying through the woods! It was the only one we had laid eyes on, and it seemed as if it had now appeared on the scene to wave us an ironic farewell. To be sure, it made us feel pretty sick; but, never mind! We are going down there again next year, and then that turkey had better look out.

F. Moonan.

Consul-General Turner's Moose.

Jersey City, N. J., Nov. 22.—*Editor Forest and Stream:* There is a report of Consul-General Turner's moose, as given in a Connecticut paper, which has been sent to me:

CONSUL TURNER A NIMROD.

Kills a 1,800-pound Moose—His Son Also Kills a Buck.

Charles E. Turner, of this city, now United States Consul-General at Ottawa, Can., has made a record for himself among Canadian hunters. Week before last he shot a moose said to be larger than any recently killed in Canada, and estimated by the truth-loving aborigines of the province to weigh 1,800 pounds. The story reaches Waterbury just in time to nip the budding pride of those local huntsmen who have carried their heads excessively tilted back of late because the chase had brought them a pair of quail or a woodchuck. Clerk Linford F. Root, of the District Court, the other day received a letter from the Consul-General, in which the writer gives a vivid description of the way he is clearing the woods around Ottawa of the big game. On one trip the Consul failed to score, but Dr. Kidd, another member of the party, shot a couple of fine bull moose, and missed another, and Mr. Daly, of the party, shot a moose and a bear. Of the killing of the big moose the writer speaks as follows:

"A week ago I went off again, and hunted just six days. I killed a buck and two moose, one of which measures 62½ inches across the antlers and has a palm of 16½ inches width. The Indians claimed that it would have weighed 1,800 pounds, and every one who has seen it says that so far there has been nothing killed in Canada which would compare with it.

"I shot it with your rifle at a distance of from 400 yards to 500 yards, and fired at it three times, one of the balls going right through his shoulder and heart and out through the other side. I suppose it is going yet.

"I took Ned with me on this trip, and he killed a 250-pound buck. Not too bad for a twelve-year-old, eh?"

Ned is the Consul's son.

Now I know Consul-General Turner. I stopped for three years in Waterbury on my way south to New York. When in business in Waterbury Mr. Turner was an extensive advertiser, and in his windows were signs, "As advertised." At that time I presume everything was "all wool and a yard wide," but given a diplomat's opportunity to exploit the truth, he is working it to the full limit, or rather has induced the aborigines to. It is not the first time that the Indians around Ottawa have "taken up a white man's burden," and I believe that Mr. Turner in this instance induced them to carry it inside or out of sight, and he tells us that the Indians said that the moose would have weighed 1,800 pounds. Through Forest and Stream let me ask Mr. Turner, when would it have weighed 1,800 pounds? When you had filled them fuller, or when it had lived a score of years more? What was the weight when it was killed? When with your suave diplomatic tongue you took advantage of Poor Lo's vivid imagination, why didn't you make it a ton or let them make it so? The Irishman in the presence of his father confessor said: "I stole siventeen hoondred of hay. Yez may as well call it a ton; I om goin' afther the rist to-noight."

Mr. Turner having gotten the Indians to fix the weight, you fixed the distance at between 400 and 500 yards—a quarter of a mile. Well, you are either smart or a descendant of Ananias, and a living proof of the theory of atavism. Mr. Turner, you say that one of the balls went through the shoulder and heart. Was the moose standing on his head with his back to you, or was the heart on the way to the mouth at fear of you a quarter of a mile away? And you say the bullet came out on the other side. On the other side of what—the heart or the moose? Did you have a range finder, and does the Government supply them?

Now about the boy and the buck. It is reasonable enough, inasmuch as you have evidently taught his ideas to shoot as well as his gun. You have done well, Charlie Turner. Just fix up Canada so that we can annex it and come home; we wish to see you.

W. W. Hastings.

In British East Africa.

Editor Forest and Stream:

I was camped on the Athi River, and was up early in the morning, intending to look after some lions which were known to be located in a reed bed some distance up the river.

Having arrived within half a mile of the spot, I saw a lion—at least he was pointed out to me by one of my men. He appeared very much smaller than what I expected, and did not for a moment present the imposing appearance one naturally associates with the lion.

He got view of me, and made off rapidly, stopping every now and again to see if he was being followed. On finding I was after him as fast as I could get along, he would again bound away, and this sort of thing kept on occurring until I lost him completely. He was evidently making for the reed beds of a tributary about two miles distant. While making my way across to this stream, I saw a rhino quietly basking in the sun, and the temptation being great I resolved to stalk him. When within 100 yards or so I discovered there was another one quite close to the first, only lying down in the long grass. The country around was quite bare of trees or bush. Having made out the direction of the wind, I found it necessary to make a considerable detour so as to be able to work well up it toward the rhinos. I must now mention that the beasts were really down in a nullah, and being considerably above them our scent must have been carried well over them.

Having got the wind right, we commenced advancing on all fours, making straight for the big fellow standing up.

Our advance, however, was not as silent as I should have liked, as one of the gun bearers appeared a little concerned regarding his own safety, and was foolish enough to express his feeling in a rather loud whisper. The moment the sound reached the rhinos the one standing broadside on immediately wheeled around so as to stand facing us, while the one lying down jumped up with a loud grunt and stood side by side with her fellow, thus presenting to our view two enormous heads facing straight toward us. Remaining perfectly still for a few minutes, so as to give the two time to regain confidence, we slowly advanced, and on raising my head to get a good view of them, I was pleased to find that they had taken up their original positions, viz., the big male (as I afterward discovered him to be) standing broadside on and the other one lying close to him and nearly hidden by the long grass. Taking a final look at my .577 to see all was right, I advanced as quickly as possible toward the big fellow that was standing up and arrived at a distance within, I should say, 35 yards.

At this time I began to feel oppressed by a feeling of extreme tension. It was about 1 P. M., the sun straight overhead, hardly a breath of air stirring. Add to this the somewhat long stalk in the horizontal position plus the fears that our game might wind or hear us and rush off at any moment, and I think the readers of this will understand the feeling above alluded to.

I decided to try the brain shot on the one standing up, so took a careful aim. Finding myself steady, I pushed forward the safety bolt, again took aim and fired.

Immediately on being hit, the rhino turned round once or twice in a kind of dazed manner. I instantly fired the left barrel at point just behind the shoulder, after which he trotted off in a rather unsteady manner, his fellow (a big male) rushing on in front.

Putting in fresh cartridges, I ran after them, and was very pleased to see the rhino I had fired at come to a standstill, and his legs suddenly appearing to grow weak, he rolled on to his side and never showed another kick. The female, which was a little in advance, turned around, and finding her mate in a disabled (in fact dead) condition seemed to give vent to all her rage and fury. She turned round and charged toward me at full speed. Stepping a little to my right, I fired at her left shoulder, knocking her completely down. But only for an instant, as she got up and again charged in the direction of one of my men. This time she presented the broadside. I again fired, and she dropped for the second time. Putting in another cartridge, I ran up to her, when by an effort she got on to her forelegs, and using her head in a threatening manner tried to horn me. Taking a careful aim, I put a bullet through her brain, and she dropped.

The whole of this exciting scene with the second rhino had occurred quite close to the first one, which was lying dead; in fact so close were the two together when dead, that on roughly measuring the distance between the nearest point of one and that of the other I found it to be about 5 feet. The rifle which I used was a hammerless double magnum .577 express. The charge is 6 drams of powder, the bullet weighing 650 grains of hardened metal. The bullets were solid, not hollow pointed.

E. Wynstone-Waters.

The Maryland Sale Test Case.

President Geo. D. Penniman, of the Maryland Sportsmen's Association, sends us the full text of the decision of the test case which was carried to the Supreme Court of that State to determine the constitutionality of the statute forbidding the sale of game in close time, the game having been brought in from another State. The official text follows:

Court of Appeals of Maryland.

ROBERT N. STEVENS VS. THE STATE OF MARYLAND.

April Term, 1899—Filed June 22, 1899.

Appeal from the Criminal Court of Baltimore.

Thos. Ireland Elliott and Harry W. Henderson for the appellant.

Attorney-General Gaither and Geo. D. Penniman for the appellee.

Argued before McSherry, C. J., Schmucker, Briscoe, Fowler, Boyd and Pearce, JJ.

Schmucker, J.—The appellant was indicted for having in his possession and exposing for sale in Baltimore City during the closed season, certain dead rabbits contrary to the provisions of section 15 E of chapter 206 of the acts of 1898. He first filed a demurrer to the indictment, which was overruled, and then pleaded *non cul.* and elected to be tried before the court.

At the trial of the case he offered to prove that the rabbits mentioned in the indictment had been lawfully killed in another State of the Union, and had been shipped to him from that State in an original package, and that he had received and exposed them for sale in that condition, without breaking the package. The State objected to this evidence, and the court sustained the objection and the verdict and judgment being against the appellant, he appealed.

The act of 1898, chapter 206, in its opening sections designates closed seasons for the game birds and animals therein mentioned, including rabbits, for Baltimore City and the respective counties of the State. Section 15 E then declares that it shall be unlawful for any person to have in his possession, expose for sale, sell or buy in Baltimore City or the respective counties any of the game birds or animals mentioned in the act during the closed season for such city or county, "whether such birds or game animals so had in possession, exposed for sale, sold or bought shall have been shot or in any manner caught or killed in that county, or in any other county in this State or in any other State, Territory or county."

Before the passage of the act of 1898 the law as it then stood after referring in its opening sections to game killed within this State, prohibited the catching and killing of game or having it in possession by any one in Baltimore City or the several counties during the closed season, but the law contained no provisions indicating that it was intended to apply to game lawfully killed outside of this State.

When the law in that condition came to be construed by this court in the case of Dickhaut vs. State, 85 Md. 451, it was held that game which had been lawfully killed

outside of Maryland and shipped into this State was not within the prohibition of the statute, and might lawfully be had in possession or sold during the closed season.

Dickhaut's case was decided in April, 1897, and at the next session of the Legislature the act of 1898, chapter 206, was passed, as its title recites, "for the better protection and preservation of birds and game animals," amending the law as it then stood and adding certain new sections, including section 15 E, which contains the words which we have already quoted.

It is therefore perfectly clear both from the language of section 15 E and the circumstances of its enactment that the prohibition of the act of 1898 was intended by the Legislature to applpy to having in possession or offering for sale during the closed season not only game killed in this State, but also game killed elsewhere.

The appellant contends that the construction adopted in Dickhaut's case of the law as it stood at that time is applicable to the present law and should control the case now before us.

This contention is not sound because the language now used in the law is too plain to admit of construction, and the circumstances of its amendment clearly declare the present policy of the State to be to prohibit the possession and sale by any one during the closed season of the game mentioned in the law, no matter where it was killed.

He further insists that if the law be intended to apply to game killed without and shipped into this State, it is in conflict with the act of Congress commonly known as the interstate commerce law, which was passed in the exercise of the exclusive power conferred on Congress by the Federal Constitution to regulate commerce among the States. The question presented by this contention is not a new one. Many of the States of the Union have passed game laws which include among their provisions a prohibition of the sale or possession of game during the closed season, and these laws have frequently been before the State and Federal courts for construction.

In some of these cases, such as the Commonwealth vs. Hall, 128 Mass., 410, and the People vs. O'Neil, 71 Mich., 331, the statute before the court merely made the possession of game within the closed season *prima facie* evidence of a violation of the law, and they, therefore, do not throw much light upon the issue before us, but in different well-reasoned cases, where it was entirely clear that the State law was intended to exclude all game, wherever it may have been killed, from the markets of the State during the closed season, the law has been upheld.

The authorities agree that the ownership of all game animals and birds is in the people in their sovereign capacity, that is in the State, and no individual has any property rights in game other than such as the State may permit him to acquire, and even when game has been captured and reduced into possession by the individual with the permission of the State his ownership in it may be regulated and restrained by appropriate legislation enacted for considerations of State or the benefit of the community.

In other words the cases hold that the question of enjoyment in this field is one of public policy and not of private right. Magner vs. People, 97 Ill., 320, 333; Ex parte Maier, 103 Cal., 476; Phelps vs. Racey, 60 N. Y., 10; Javins vs. U. S., 11 Tucker (D. C.), 347; Commonwealth vs. Savage, 29 N. R., 468.

In the case of Geer vs. Connecticut, 161, U. S., 519, Justice White, speaking for the court, reviews at length the origin and history of the State's ownership of animals *feræ naturæ* and fully upholds the doctrine announced in the cases which we have cited and distinctly recognizes the authority of the State to affix conditions to the killing and sale of game predicated, as he says this power is, on the peculiar nature of such property and its common ownership by all the citizens of the State.

The right of the State to regulate and control the killing, possession and sale of game within its borders is also held to rest upon its police power, and if the provisions of the laws by which such regulation is made are reasonable for the accomplishment of the end sought to be obtained, the law will be held to be a valid exercise of that power. In Lawton vs. Steele, 152 U. S., the court says: "The preservation of game and fish has always been treated as within the proper domain of the police power, and laws limiting the seasons within which birds or wild animals may be killed or exposed for sale and prescribing the time and maner in which fish may be caught have been repeatedly upheld by this court."

In Geer vs. Connecticut, supra, the court said: "Aside from the authority of the State derived from the common ownership of game and the trust for the benefit of its people which the State exercises in relation thereto, there is another view of the power of the State in regard to the property in game which is equally conclusive. The right to preserve game flows from the undoubted existence in the State of a police power to that end, which may be none the less efficiently called into play because by doing so interstate commerce may be remotely and indirectly affected." In support of the proposition so announced, the Supreme Court cites Kidd vs. Pearson, 128 U. S., 1; Hall vs. DeCain, 95 U. S., 485; Sherlock vs. Alling, 93 U. S., 103.

That the total prohibition of having game, from whatever source derived, in possession during the closed season, is a reasonable, if not necessary, means of protecting the domestic game of the State making the prohibition, has been held in a number of the cases already cited, and also in American Express Company vs. People, 133 Ill.; Roth vs. State, 51 Ohio St., 209; State vs. Randolph, 1 Mo. App., 15. The act of 1898, chapter 206, does not prohibit the importation of foreign game into any other portion of this State than the counties in which the law is operative, and even in those counties the prohibition is for but a portion of the year.

We are therefore well within the authorities in holding that the passage of the act constituted a valid exercise by the State of power which it clearly possessed, and that its provisions are reasonable for the accomplishment of its purpose, and that its operation upon interstate commerce is of that remote and incidental character which the Supreme Court in Geer vs. Connecticut has said does not interfere with the right of a State to protect its game.

It cannot be successfully contended that the law now under consideration is unconstitutional because it operates unequally upon the inhabitants of the several parts of the State, and that it discriminates against the residents of Baltimore City by reason of the fact that a number of counties are excepted from its operation. It has long been the policy of the State of Maryland to enact local laws affecting only certain counties or to exempt particular counties or localities from the operation of general laws or of some of the provisions thereof.

Nor is the law at variance with the provisions of article 3, section 29, of the State Constitution, because it embraces more than one subject and has a misleading title. The law in its title is described as "An act to repeal and re-enact sections 13, 14 and 15 of article 99 of the Code of Public General Laws, title 'Wild Fowl, Birds and Game,' and to add certain new sections for the better protection and preservation of birds and game animals."

The several sections of the act relate to and are germane to one subject matter, the protection and preservation of birds and game animals, which is described in its title, and this is all that the Constitution requires. "While the title must indicate the subject of the act it need not give an abstract of its contents nor mention the means and method by which the general purpose is to be accomplished." M. & C. C. of Baltimore vs. Reitz, 50 Md., 579.

We think the indictment was not defective. The offense was one created by statute, and the indictment described it in the words used in the statute. This has repeatedly been held by this court to be sufficient. Mincher vs. State, 66 Md., 227; Gearfoss vs. State, 42 Md., 403; Dickhaut vs. State, 85 Md., 464.

The judgment appealed from will be affirmed with costs.

New York Game Protectors.

A RADICAL reform is promised in the enforcement of the game laws in this State. For several weeks past Governor Roosevelt has been looking into the matter and is pretty thoroughly convinced that there is plenty of room for improvement. He has received numerous complaints of violations of the law in the matter of hounding deer and killing game out of season, and has been informed that many of the fish and game protectors were not competent to perform the work expected of them.

This morning the Governor received a delegation of Adirondack guides from the Brown's Tract Guides' Association and gave them a very plain talk on the subject of the standard of efficiency that will be required for fish and game protectors. The guides were all in favor of a strict enforcement of the game law. They said that one of the prime requisites for a game protector is "sand," and added that protectors in the past had not been overburdened with that necessary quality. Further than that they said that a good many of the protectors were not competent to go into the woods without a guide.

Richard C. Crego, H. Dwight Grant, William M. Commerford and Merrill White, of Boonville; Henry H. Covey, and William Dart, of Big Moose; Garrie Riggs and A. M. Church, of Old Forge, and Lester W. Kernan, of Utica, who constituted the delegation, were very frank in discussing the shortcomings of many of the game protectors and said they were not competent to go into the woods without a guide.

The Governor interrupted them to remark very emphatically that he would not tolerate a game protector who has to have a guide to take him through the woods. Just what course he would pursue in the matter, he said, he did not know, but if necessary he would have an amateur civil service examination on his own hook to determine the qualifications. He would have a man sent into the woods for a day and a night as a test of his ability. He ought to be able to handle a rifle, an axe and a canoe, and also to use snowshoes when necessary. In short, a game protector should be a practical woodsman.

His remarks were received with the liveliest interest by the guides, and when he had finished, H. D. Grant, who has been a guide for thirty-five years, arose and declared that if the Governor could secure that class of men—men with "sand"—there would be no more violations of the game law in the woods.

At the close of the conference all of the guides gathered about the Governor to shake hands with him and thank him for the effort he was making to prevent the destruction of game in the State forests and the forests themselves.

In a few days the Governor will receive a delegation from the Saranac Guides' Association.

As a result of to-day's conference, Governor Roosevelt sent the following letter to the Fisheries, Forest and Game Commission:

State of New York, Executive Chamber, Nov. 28.—To the Fisheries, Forest and Game Commission, Albany, N. Y.: Gentlemen—I have just been called upon by a delegation representing the Brown's Tract Guides' Association. I have had very many complaints before this as to the inefficiency of the game wardens and game protectors, the complaints usually taking the form that the men have been appointed and are retained without due regard to the duties to be performed. I do not wish a man retained or appointed who is not thoroughly fit to perform the duties of game protector. The Adirondacks are entitled to a peculiar share of the Commission's attention, both from the standpoint of forestry and from the less important but still very important standpoint of game and fish protection. The men who do duty as game protectors in the Adirondacks should by preference be appointed from the locality itself, and should in all cases be thorough woodsmen. The mere fact that a game protector has to hire a guide to pilot him through the woods is enough to show his unfitness for the position. I want as game protectors men of courage, resolution and hardihood, who can handle the rifle, axe and paddle; who can camp out in summer or winter; who can go on snowshoes, if necessary; who can go through the woods by day or by night without regard to trails.

I should like full information about all your employees, as to their capacities, as to the labor they perform, as to their distribution over the country, both where they are appointed from and where they do their work.

Very truly yours, THEODORE ROOSEVELT.

—Albany Evening Journal, Nov. 29.

"The Trail of the Sand Hill Stag."

WITH a colored plate and illuminated title page Messrs. Chas. Scribner's Sons have published Mr. E. S. Thompson's article which appeared some time ago in Scribner's Magazine. Needless to say, the volume is beautifully gotten up and illustrated.

The Man and His Gun.

I OFTEN pass a large factory of shotguns in my home town, and with more interest than if it were a flour mill or a wagon shop. Visitors naturally are not popular in the work rooms of the establishment, but I have seen something of the inside of it, and one who has an eye for a gun will see a good deal with that same eye in merely passing the windows of such a shop. He may see, for instance, a great floor space full of the machines that bore and smooth the inside of the barrels to the exact lines and surface necessary for the best execution. At some of the windows men are putting the polish on the outside. Elsewhere one may notice the barrels getting their final complexion; whether the ringed, streaked and speckled pattern that the Belgian artisan—or should we say artist?—hammered into them, or the sleek black coat on the high-grade plain steel which fools the casual observer with an appearance of cheapness. Apparently they will always call this process browning because there was a time when gun barrels were actually brown. At other windows men with good eyes and steady hands are manipulating the files with those firm yet delicate touches that have to be made just right to preserve such a reputation for good gunsmithing as is here at stake. Nowhere else in the shop does ingenuity triumph more distinctly than where the woodworking machines turn out the shapely stocks from stubborn walnut planks, and mortise them in almost no time for an exact fit with the receiver. Science, art and nature combine to display on the perfected stock the inimitable pattern of knots or roots, appropriate to the beautiful and intricate design which the "browning" brings out on the welded barrels. Art reigns alone in the well-lighted room where the fine guns are decorated by the engravers. The buyer with money to burn can have sporting scenes here pictured on the lockplates of his gun. But he is not always so much ahead of the poor shooter who has only powder to burn. The latter, if he have a fair memory and a little imagination, can see a whole panorama of such pictures follow each other across the plain lockplate of his own cheap but well tried and well trusted weapon.

These guns are not without honor in their native town, but of course comparatively few stop here. There is a creditable group of trapshooters partial to them, but the game in the near vicinity is reduced to the passing water fowl and the irrepressible rabbit. Two or three blocks from the shop is one end of a street car line. At the other end is a weedy lake, where straggling ducks spend the fall and get waywise dodging shot from frequent boats and from a long wall of dead cattails. The fine river which sends a share of its volume to turn the gun shop's wheels, lies in long, still reaches above and below the town, embracing islands around which an occasional duck can be picked up. But the guns as a whole are due elsewhere, and it is interesting to fancy their history. Appointments more or less complete have been made for them all the way to the borders of the United States and beyond. Famous trap shots and ardent game hunters far and near await their coming. Some of their future owners do not know the pleasure in store for them. Others do, and are impatiently watching for their arrival. The chances are that at the next great trap tournament, North or South, or beside whichever ocean, more of these guns will be used than of any other make. It has happened more than once or twice. On thousands of fields and marshes and club grounds they will speak for themselves, and their makers. Many a farmer's boy will be proud of a cheap one, and many a city doctor or lawyer or business man equally proud of a finer specimen. Many a writer for the sportsmen's press will take pains to mention his gun by its well-known name, for the sake of the implied compliment to himself for having been so smart as to select the right make.

The up-to-date breechloader commands the admiration of every person with any mechanical sense, as a triumph of ingenuity and sound, honest workmanship. It has to be sound. As with a railroad bridge, its every use is a strain upon its own strength and its builder's reputation. When American guns are so generally strong, effective and convenient, the manufacturer would have a poor chance of business who offered flimsy or clumsy weapons. Faulty devices and materials have gone under in the hard competition, and for a price lower than could have been imagined when breechloaders were introduced in this country one can be got that will satisfy eye and hand, will kill the game, and with any sane loading will not kill the shooter.

But it is the sort of semi-human association, of which it is capable, that gives a gun its highest fascination and makes it interesting to follow in fancy the shipments from such a factory as this of my neighbors. To the appreciative amateur who gets one of these well-made double barrels it will not be so much a tool as a companion, perhaps a pet. What other shape of wood and iron, what other manufactured thing, so much so? When it has for years shared its owner's trampings and boatings, supplying perhaps the chief motive for them, when it has basked with him nightly in the glow of the camp-fire or the hearth fire, he feels toward it a sentiment of comradeship. When it has often brought him the exultation of a clean kill, the enjoyment of a game feast and the honors of the tournament, he cherishes toward it a feeling like gratitude. When its close-fitting bolts have long yielded handily to his thumb and never to any explosive strain, and its tough barrels have a thousand times withstood the vicious thrust of the nitro and sent the shot true to his aim, he finds it easy to credit the gun with something like fidelity. Ere long he loves it and wants to sound its praise. Perchance he indites an ode, and, escaping indictment himself, fires it at an unoffending editor. If rather less daft and more genuinely literary, he may celebrate the breechloader in some such fine prose sketches as William Black's. If not up to poetry or fiction, but just an ordinary, honest, appreciative gun crank, he will be apt to submit to his favorite sportsmen's journal some such observations as the foregoing. BRISTOL HILL.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

The Ethics of Shikar.

From the Asian, Calcutta.

THE necessity for a system of ethics is evident throughout all the various conditions of life, and is so indissolubly inseparable from a satisfactory state of society that it may almost be said to have become a law of nature. In all things appertaining to sport, of whatever description, the indispensabiliy of some recognized standard of morality, enabling one at once to distinguish between right and wrong, between good form and bad form, as well as absolute criminality, is a matter of common consent. The morality of each kind of sport has its special peculiarities; in racing, for instance, practices appear to be legitimate which are quite unintelligible to the outsider, who is ignorant of the ethics of the sport of kings. But in all things the fundamental rule is that the elements of etiquette should rest on the basis of the requirements of the good of the community, and this may be broadly taken as the standard by which to judge of the soundness of moral laws.

Perhaps there is no sport in which this element is more subtle or which involves finer distinctions than that of shikar. To the primitive hunter the sole object is to obtain his quarry, irrespective of any consideration of the methods by which its destruction is encompassed, so long as those methods are swift and sure. And this can be easily understood in cases where hunting affords a means of existence, and especially where weapons are limited to snares, bows and arrows, spears, and such like implements. But in civilized societies the chase has lost its original significance as a means of existence, and has become a pastime; hence a system of ethics has arisen, based partly on the necessity of preserving game from total extermination, and partly on a natural or acquired sense of fair play inherent in civilized man, and has given rise to a distinction between sportsmen and professional hunters.

For instance, the true sportsman will not indulge in unlimited slaughter, nor will he, when once he has learned the morality of the chase, drive for deer or antelope or hill animals, or in fact any game that can be stalked. Such a method of procedure is not considered legitimate according to the unwritten code of sport, and the man who drives for deer when he should stalk them is very properly regarded as having violated one of the fundamental laws of that code. In this country, for instance, the only wild beasts that should be driven are tigers, panthers, and in some cases bears, and to beat for other game is considered unsporting. We refer, of course, to the larger kinds of game, and not to birds.

Again, with regard to night shooting, and in fact to all shooting under the system which is commonly called "sitting up," it is, we believe, generally conceded that it is legitimate to sit up over a kill for tigers and panthers, although we know that many sportsmen will not employ this method, if it can possibly be avoided, regarding it as not quite fair on the game, especially in the case of the larger felines. But to shoot deer over a pool of water, either by daylight or by moonlight, is to commit a most flagrant act of poaching, even worse than driving for such animals. Then, as regards the sex of game. Here there can be no mistake. The males in the case of the Ungulata must alone be shot, and the females must be left unmolested. But the weaker sex in the case of dangerous animals, such as tigers, panthers and bears, even where it is possible to distinguish them, enjoys no such immunity; although some very strict and self-denying sportsmen will allow an animal with young ones to escape. Similar rules apply to the killing of the young of wild beasts. It may be said that no immature animals should be shot, except in the case of dangerous game; and even here we come to debatable ground, for the sparing of the young of tigers and bears, under certain circumstances, has lately been advocated in more than one quarter, and is doubtless a theoretically correct principle from the sportsman's point of view, although contrary to that of the philanthropist.

Although trophies do not constitute the main object of sportsmen, yet they have their value in connection with the chase, and it is partly owing to this fact, and partly by reason of the unsophisticated ways of young animals, that these latter are spared; and it may be stated as an axiom that no animal should be shot unless it bears a trophy worth keeping. But here we come to a question which we must leave our readers to answer for themselves. What sized trophy is worth keeping?

No wounded animal, dangerous or otherwise, should be left to perish miserably so long as there is a reasonable hope of recovering it. And in this connection it may be remarked that beaters should never be made to drive for wounded animals of a dangerous nature. The sportsman should himself follow up such a beast; nor do we think the method, recommended in the Badminton Library volume on "Big Game Shooting," of following up a wounded tiger, is quite in consonance with the morality of the chase.

The ethics as regards weapons to be used is one that has a certain fundamental principle. The main point is that the arm should be an efficient one, the best obtainable for the purpose of killing an animal outright, so as to avoid inflicting unnecessary suffering. Correspondence in our columns regarding the respective merits of large and small bores should supply food for reflection on this point. Long and uncertain shots, by which animals are likely to be wounded, should be avoided. For, paradoxical as it may appear, the man who indulges in the chase should be at least as humane as other people. In fact, cruelty would head the list of crimes chargeable under the laws of the subject with which we are dealing. Therefore sportsmen should exercise great circumspection in the choice of weapons and ammunition. It is, perhaps, needless to say that a bullet, and not a charge of shot, is the only legitimate projectile for use against all animals (hares excepted) of the chase inhabiting this country, except that it may be considered permissible to slay a panther with a charge of buckshot.

From the morality of sport as it concerns the game, we may pass to the etiquette with regard to shooting rights—a burning question which has given rise to frequent unpleasantness and a considerable amount of difference of opinion. In the first place, sportsmen should banish from their minds all ideas of competition, and should divest themselves of all feelings of jealousy and selfishness such as are too frequently in evidence, as we have previously had occasion to remark. Hunters should be brethren—and indeed are proverbially so. And the better class of sportsman is always willing and ready to help others and to give advice and assistance to those who are in search of information. There should be a system of give and take for the good of the community, and no dog-in-the-manger policy, no jealous concealment or subterfuge, no placing of obstacles in the way of others, but a recognition of the rights of all, which are presumably equal on public shooting grounds. Certain recognized rules, like those which for years have obtained in Kashmir, give priority of claim where necessary, and if all sportsmen would act fairly and reasonably toward each other there would be no further trouble, and no occasion for an acrimonious exchange of personalities in the columns of our newspapers.

All that is required for the attainment of this desirable but, we fear, somewhat Utopian end, is good feeling, and the recognition of certain elementary principles of ethics based on the necessity for maintaining the equal interests of all.

Maine Woods.

BEMIS, Me., Dec. 2.—Not the slightest trace of the lost Richard M. Knight has yet been found. He went into the woods from this place Oct. 24 with a companion to hunt deer, but has never returned. His hunting companion got in in due season. As has already been explained, he has been hunted for by almost armies of men, over 500 having hunted in line one day. As is well known, he went into the woods to the east of Lake Mooselucmaguntic, and the men have been formed in line up the lake from this point and the line has moved eastward under the direction of guides and woodsmen, with a director to every squad of fifteen or twenty men. The guides or directors blazed or spotted a line of trees as the line of searchers progressed. These blazed lines can easily be followed up to the top of the mountain ridges a couple of miles or more, and the wonder is that young Knight or his dead body has not been found. Still, most of the country is very thickly wooded and some of it very rough and almost impenetrable by reason of jagged logs, tree tops and "blow downs." With Prof. J. F. Moody, of Auburn, Me., and Mr. J. H. Jones, of Boston, I have been deer hunting over the same ground for a couple of days. A crusted snow has prevented our getting deer, but the signs show them to be very plenty. The wonder is that the lines of searchers for young Knight have not driven them out of the country. They seem even more plenty than a year ago, when we hunted over the same ground. Some of the searchers say that deer were very frequently started, but that they would actually dodge back between the men after starting ahead of the line a few times. It would seem that they do not care to be driven from their haunts.

The prevailing opinion here is that Knight hurt himself in some way after separation from his hunting companion, and that his dead body lies in the woods not very far from this point. Capt. F. C. Barker, proprietor here and very well known to everybody interested in fishing and shooting in this section, gave him instructions before he started for the woods—told him about the tote road running northeast to Rangeley and about the many logging roads, all leading to the lake. Then, when it was found that he was lost, one of Capt. Barker's little steamers was fired up and sent up and down the lake to whistle every few minutes. This was kept up for several days. This whistle and that also of the railway trains—four of them a day—in and out from here, can be heard six or eight miles into the woods. We have heard them each day that we have been out, and the direction of the sound has been perfect. Some of the guides are still searching for Knight's body—we met one to-day—as a reward of $400 for the recovery of the body is still out, and will remain in force till June 1, 1900, if necessary. The reward is offered by J. E. Knight, the young man's father; Arthur Wilson and Hiram Ricker & Sons, of Poland Springs, where young Knight was clerk before starting on his doubtless fatal hunting trip. The guides have a theory that the foxes and bob cats may aid them to find the body as soon as snows come deep enough to shut off the food of these animals. They will dig down through the snow for the bodies of animals on which to feed, and the guides believe that a human body will share the same fate. Fox tracks and cat tracks will be carefully followed by guides and woodsmen. We have followed some to-day, but they have led us to no important conclusions.

Mr. J. Parker Whitney and Sam Parker passed through here yesterday, going to Boston, from Mr. Whitney's camps at Mosquito Brook, Richardson Lake. They had one very fine deer head.

Boston, Dec. 4.—The open season on moose in Maine ended Thursday, Nov. 30. It is certain that the number falls a good deal behind a year ago. The number recorded as passing through Bangor was 134—74 in October and 60 in November. For some reason not yet explained the number for the whole month of November was less than for the sixteen days of open season in October. One moose hunter suggests the reason for the greater number taken in October was that the guides had a good many moose located ready for the coming of the hunters.

The rain of Friday night removed the snow from the Maine hunting grounds in most sections or left it in a State so crusted as to make deer hunting exceedingly difficult. This is good for the deer and will help to carry more of them over for breeding stock another year than would otherwise have been the case, for although the visiting sportsmen are generally done for the season, the resident hunters were after the deer in great numbers. The number of these hunters is greater than those most interested in the welfare of the game in that State seem to comprehend, and the interest is increasing very rapidly. Every man and boy in the big game sections owns a rifle. Many of them guide till cold weather and snows drive the sportsmen home, then they "go in for their own meat." The number of deer killed by this late hunting, often on snowshoes, is enormous—I believe much greater than the number shipped out by sportsmen, though the record of shipments through Bangor and other outlets is generally taken as an index of the number of moose and deer killed in Maine. If the buyers of deerskins would speak out, they could tell a story. One instance will give some idea of what I mean. The wardens seized one day last week 100 deer skins. They were in a freight car consigned to C. E. Robinson, of Boston. They were shipped from Crystal, a station on the Bangor & Aroostook road—100 deer skins from a station from which sportsmen have not shipped half that number. Sportsmen do not leave their deer skins behind. Hence these skins must have been taken from deer killed by local hunters. Mr. Robinson holds a license to buy deer skins in Maine, but the wardens claim that this license does not permit him to ship them out of the State. The case is exciting a good deal of interest, and the courts will have to settle it. Mr. Robinson buys deer skins for a Plymouth glove concern. The open season on deer in Maine closes Dec. 15 this year, and this will shut off sixteen days of the worst of the killing of deer by local gunners under the old law, which closed the season Dec. 31. Boston sportsmen have brought home for the week about thirty deer and no moose.

SPECIAL.

Reported Hunting Grounds.

Editor Forest and Stream:

Often reports from various hunting grounds are somewhat misleading. Owners of camps, guides and others interested often spread reports of the amount of game to be easily found, which visiting sportsmen fail to verify. In times past I have been taken in by such glowing reports, and have spent some months in certain places which were claimed to be "the home of the moose, caribou, deer and beaver." I was not looking after the last named, but if the region I spent so much time in had ever been the home of the first three, they certainly had left their home, and to all appearances, for good, when I called. For six weeks on one of my first trips after large game I hunted over miles of very wild ground near the Canadian boundary. I had as good a guide and woodsman as there was in that region. Frequent light falls of snow made the best conditions for still-hunting I have ever experienced. All that was lacking was the game, and of that there were not even old signs. Day after day we cruised over miles of good-looking ground. My guide had promised to find both moose and caribou if I would stick to it, and he certainly tried his best. I stuck for six weeks, and at last the guide said it was no use. There was certainly one advantage in hunting the above region—I did not have to carry many cartridges. One cartridge was all I used, killing a caribou with it, which was the only animal I saw on the trip larger than a rabbit.

Recently I saw an account of the number of deer killed this season in a certain locality in this State. According to the account it would seem that about every one who went out with a rifle got one or more deer. I have been three times to this place during the fishing season and it certainly looked as though there might be deer there. I had half made up my mind to go there and try some still-hunting. I can get to the place in a few hours.

I know a man living quite near the hunting grounds, and I consider him reliable in every way. I wrote him, and his reply is as follows (and he was interested in a pecuniary way to some extent in my making the trip):

"As to deer, there have been quite a number killed, but not one to every twenty-five men who have been after them. If you could have any part of the places you speak of to yourself on a good snow you would stand good chances of getting shots, but when snow comes those hills will be half-covered with hunters. I have been intending to go, but knowing there were so many other hunters out, has taken all the courage out of me."

My correspondent has certainly taken all desire out of me for still-hunting in his region. I am not in the least afraid of shooting some other fellow, as I have always stuck to the rule of never shooting until I was sure of what I was shooting at, and I have been quite successful in still-hunting moose, caribou, bears and deer. Sticking to my rule, however, has lost me a few shots on deer in places where I was almost sure there were no other hunters in the woods. It is the shooting of the other fellows I am afraid of, and when the woods are full of local hunters always ready to shoot at anything that moves, I prefer to keep out.

C. M. STARK.

DUNBARTON, N. H., Nov. 29.

"Hounding Deer."

Editor Forest and Stream:

FOREST AND STREAM being one of the few journals devoted to field sports that endeavors to keep "sport" respectable, a story of deer hounding that came to my knowledge to-day seems worth repeating.

Some friends of mine have just returned from a trip "after deer" and frankly admit that they ran the deer with hounds, there being "no law there." The one deer they got had its leg so broken by shot that it hung useless, yet it ran at least five miles through the worst of country before it was caught, the hound in full chase, and holding it several times, enabling the hunters to put several rifle balls into it.

Now, had there been no hound to run it, that deer would certainly have been lost, and lingered on in misery for a considerable time. Yet a certain set of hunters snort about hounding being "beastly," "unsportsmanlike," etc., and cry "game hog" and similar rot. Now who is the "hog"? The man who wounds a deer, leaving it to suffer agonies for an indefinite period, or the one who uses the self-evident means of really getting that deer? As far as results go, the former enjoys the infliction of pain for the fun of shooting, and the latter shoots a deer to kill, and get it. A certain Western journal did more in its day to encourage that pestiferous rot about "true sportsmanship" and "manly sportsmen" than years of sense will drive out of the heads of a class of hunters who have no sense, and I well remember of one individual, just about the most emphatic "bad egg" among dog men, whose offer to make a bet was lauded "manly sportsmanship."

I have no personal feeling in this matter. I would far rather eat good mutton than venison, and see no fun in standing on a "stand" holding a gun on a cold day, nor creeping under bushes laden with snow, trying to shoot a deer; but I do know plenty of men to whom just such work is the greatest delight, and know that there are no better men than just those whose enjoyments would be

none to me, and I don't propose to set up my ideas to measure theirs by; only I do object to a set of fellows measuring other's corn in their own half-bushels. It don't suit them to keep hounds, therefore hounding is necessarily beastly. It isn't their way to run wild turkeys with dogs and shoot them off a tree, therefore those whom that does suit are "hogs." In few words, "orthodoxy is their doxy; heterodoxy is the other fellow's doxy."

W. WADE.

OAKMONT, Pa., Nov. 28.

A Long Island Deer Hunt.

From the New York World of Dec. 1.

PINK coats, winding horns, yelping hounds, prancing hunters, a fine, bracing air and a stiff country, whoop and away! Society had the greatest hunt of the year over Hempstead Plains yesterday. It chased a real live deer and drove it to bay in a barn. So last night the entire hunting set congratulated the Meadow Brook Hunt Club on the glorious day, and the young bloods who were in at the kill (beg pardon, at the finish) in the barn are the envied of all.

The "royal stag" was a two-year-old captured at great cost. He was trembling with fright while the master of the hounds, Ralph N. Ellis, and his grooms got him ready for his run for life. The pack, composed of twenty-five English-American hounds, was let loose.

The little deer got his freedom in a big field, well fenced in. A lash of the whip and he was off, but the fences stayed him. Round and round the field he ran wildly, while the horsemen sat on their horses waiting to break away. Full fifteen minutes the animal tore this way and that, but never once did he take a fence. So they set two hounds to worry him.

Only then did the deer take a fence and make off for his life, the yelping pack at his heels. He started toward Woodbury and ran as gamely as he could for full five miles. It was great sport for the yelping pack and the gallant horsemen. The course led over stiff country, through the woods and over heavy fields thick with fences. And at last the hounds drove the deer to bay. Panting and exhausted, he took shelter in a barn on the Jackson farm. The hounds stormed in yelping for a prey that had eluded them so long. But the grooms and whippers-in saved the poor beast's life. He will be useful again, for another run for his life, that the riders and hounds may have genuine sport again, such as they had yesterday.

It was a great hunt. No one was hurt. Only one rider got a fall, and that wasn't much. So the luncheon at the Meadow Brook Club that followed the run was enjoyed, and over their Scotch and soda the hunters told stories that kept them till it was time to dress for Thanksgiving dinner.

West Branch Ponds Country.

Editor Forest and Stream:

I have just returned from a week's hunt around Charley Randall's Camp, at West Branch Ponds, nineteen miles north of Katahdin Iron Works, Maine. On the way into the ponds over the tote road, I met coming out Mr. G. B. Lehy, of Boston, and Mr. R. B. Andrews, of Leominster, Mass., with two jumpers carrying two bull moose and four bucks. One of the moose had a very good head and probably weighed 850 pounds, the other being smaller. These were shot on Mt. Baker.

I never have spent a more enjoyable week in the woods than I had with Eugene Robinson for guide. Our quarters were at Randall's Camps, and we hunted all around there, and up over White Cap Mountain. The third day there I shot on the south side of White Cap two goodly bucks, one of them the best head I have seen from Maine this year, the antlers being very wide and high, with a total of fourteen points.

We trailed two different moose, both of them proving to be cows. One of them we found lying down, and so had a chance to observe her for two or three minutes before she saw us and got up.

The hunting down along the rivers was rather poor, owing to a crust, but higher up along the sides of the mountains there was from 6 to 10 inches of good snow and excellent tracking. R. L. WARNER.

Wild Rice Success.

DERBY LINE, Vt., Nov. 25.—*Editor Forest and Stream:* Some time ago I noticed a couple of letters in the FOREST AND STREAM with reference to sowing wild rice, the length of time it took to mature, etc. My experience has not been extensive, but such as it is I give it. In the fall of 1898 I bought one barrel of wild rice from Chas. Gilchrist, of Port Hope, Ont. When it arrived I put it into grain bags and these I sunk in an old spring near my camp on Lake Memphremagog. After leaving them there for twenty-four hours I emptied the rice into my canoe and paddled up a sluggish stream that runs into the lake. Wherever I found a small bay or indentation I threw out the rice freely where the water was from 6 inches to 4 feet in depth. This was in the last week of October, 1898. This fall the sides of the creeks and little bays have been one mass of wild rice. It headed out in first-class shape, and ducks were more plentiful than I have known of their being for years. This, to my mind, does away with the idea that it takes three or four years for wild rice to show itself after being sowed. This fall I bought three barrels more of wild rice and am experimenting on a more ambitious scale, with what success remains to be seen.

J. B. GOODHUE.

John Gomez is Still Living.

GORDON'S PASS, Fla., Nov. 30.—Homeward bound. Have been to Panther Key. Old John is still on deck. Scarcely older than when I first knew him. The weather has been unsettled; have been wind bound half the time, but birds are plenty and fast. What more could we ask?

TARPON.

DON'T SHOOT
until you SEE your deer—and see that it is a deer and not a man.

Sea and River Fishing.

Black River Association.

UTICA, N. Y., Dec. 4.—*Editor Forest and Stream:* The Black River Fish and Game Protective Association held its twelfth annual meeting on Saturday, Dec. 2. There was a good attendance, and many subjects of mutual interest were discussed.

The annual report of Treasurer H. A. Pride showed the finances of the organization to be in a very satisfactory condition.

Secretary W. E. Wolcott presented his annual report, which was in part as follows:

It seems to be the consensus of opinion among sportsmen that the game laws in New York State are now in fairly good shape, and the main thing that is lacking is a force of protectors sufficiently large to properly enforce them.

The provisions in the game laws prohibiting the use of dogs and artificial lights in hunting deer are universally commended, and have been attended with excellent results. During the summer deer were reported very numerous in the Adirondacks, but owing to the continued dry weather in the fall, which made still-hunting impossible, the number killed was considerably smaller than in 1898. It is stated that a score or more of shooting accidents occurred in the Adirondacks during the hunting season this year, and it seems desirable that some legislative action should be taken this winter with a view of affording better protection to people who desire to be in the woods in the fall. Any one who has not sufficient common sense and self-control to defer pulling the trigger until he knows positively that he is not shooting at a human being should never carry a gun in the Adirondacks or anywhere else. It has been suggested that it would be well to enact a law which shall provide that a hunter who aims at, shoots and kills a human being by accident shall be adjudged guilty of manslaughter in the second degree, and that one who shoots at and wounds without killing shall be adjudged guilty of assault in the second degree.

Before the bird shooting season opened it was thought there would be fairly good hunting in central New York this fall, but, as a rule, sportsmen have not succeeded in finding many partridges and woodcock. The law enacted by the Legislature through the efforts of Senator Coggeshall, making the open season for these birds in Oneida county from Sept. 1 to Nov. 15, is believed to be a wise one, and many hunters would be glad to have another month cut off from the first part of the season.

During the past ten years our Association has annually obtained from the State fish hatcheries large numbers of infant trout, which we have carefully planted in the waters of Oneida and Herkimer counties. This continued restocking has borne good fruits in the main, and the young fish have prospered finely. There have been some rather discouraging reports, however, from certain localities where parties who did nothing whatever toward the work of stocking have persistently caught out the small fish. Notwithstanding this fact, it is believed that the good results obtained are sufficient to warrant the continuance of the work in certain waters. Six different consignments of trout have been received and distributed by our Association this year. In March twenty cans of yearling brown trout in prime condition were planted in the new Forestport reservoir on Black River, and in June nine cans of yearling rainbow trout and fourteen cans of brown trout yearlings were placed in the same waters. In April we obtained 20,000 brown trout fry, 400 yearling brown trout and 200 yearling brook trout, which were shipped to Oriskany Falls, where they were taken in charge by Supervisor F. W. Wasmuth and distributed in the Skenandoa and Oriskany creeks. In May we obtained 50,000 brook trout fry from the Fulton Chain hatchery, which was apportioned to different towns as follows, for planting in the streams: Forestport, 9,000; Alder Creek, 4,000; Remsen, 12,000; Trenton, 5,000; Marcy, 10,000; Honnedaga, 10,000. This fall we obtained from Caledonia 500 fingerling trout to place in streams in the town of Floyd.

It is reported that the rainbow trout will do well in the State reservoir at Forestport, as they are fond of large bodies of water. James Annin, Jr., in a letter to us, said that for the past two and a half years he had been planting rainbow trout yearlings in a number of places, and in every case the most favorable reports have been received. A year or two ago plants were made in Moose River, near Old Forge, and it is said that a number were caught there last spring which showed a very gratifying growth. Very satisfactory reports have also been received from plants made in Stoney Lake, Lewis county, and Lake Titus, Franklin county. Near Hammondsport, Steuben county, last spring, a rainbow trout was captured in a stream tributary to Keuka Lake, which weighed 15 pounds. The rainbow trout are said to be very gamy and to furnish as lively sport as the speckled trout.

In regard to the subject of forest preservation, in which our Association has always taken such a deep and active interest, there is but little that is new to be said. Lumbering operations continue in the Adirondacks on an ever-increasing scale, though, of course, on private holdings and club preserves, over which the State has no jurisdiction. As yet the State has taken no steps toward acquiring title to the forests on the watersheds of the reservoirs, but it is hoped that a move in this direction will be made before long. One great victory for protection has recently been won in the decision which debarred a railroad company from constructing a line through the heart of the wilderness from Saratoga to St. Lawrence county.

Many assurances of appreciation of the good work the Black River Association has done and is doing have been received during the past year, together with voluntary promises of substantial assistance whenever it is required.

At the conclusion of the Secretary's report, Wm. L. Fowler told about his experience in capturing a rainbow trout weighing 1½ pounds in the Adirondacks last spring. The fish made an exceedingly gamy fight.

The subject of deer hunting was discussed at some length by S. R. Fuller, Chas. H. Clark, W. L. Fowler, Chas. E. Pierce, H. A. Pride and others, after which the following resolution, offered by John H. Williams, was adopted:

Resolved, That it is the sense of this Association that the season for shooting deer in this State should open Sept. 15 and close on Nov. 25 in each year.

H. A. Pride spoke at some length concerning the new Forestport reservoir on Black River, which is five miles in length and half a mile wide in some places. Eight or more splendid trout streams empty into the reservoir, and he thought there ought to be good trout fishing in the reservoir tiself. He said that although the reservoir was built by the State for State purposes, the water had frequently been drawn off so that logs could be floated down stream. The reservoir would be drawn down to the natural level of the river and then allowed to fill up again. The pond is full of fish, but as far as the speaker knew, only one trout was caught there during the season. There has not been a month during the past summer, said he, when you could not count a thousand dead fish there because of this raising and lowering of the water. The President and Secretary were authorized to bring the matter to the attention of the State League.

Charles H. Clark, of Oriskany, offered the following resolution, which was adopted:

Resolved, That we heartily indorse the statements recently made to the Governor by the Black River Guides' Association regarding the inadequacy of the present corps of protectors to properly enforce the game laws in the Adirondacks, as we know that there has been no apparent effort by said protectors to enforce them in that territory in which we are especially interested.

Resolved, That we heartily approve the action of Governor Roosevelt in asking the State Fish, Game and Forest Commissioners for a statement as to what they have done.

J. W. Hicks offered the following, which was adopted:

Resolved, That it is the sense of the Association that the season prohibiting hares and rabbits in Oneida county should open Oct. 1 and close Jan. 15 in each year.

The following officers were elected: President, John W. Hicks, Oriskany; Vice-President, Simeon R. Fuller, Holland Patent; Secretary, W. E. Wolcott, Utica; Treasurer, H. A. Pride, Holland Patent; Directors, Edward Robertson, Trenton; George G. Chassell, H. A. Pride, S. R. Fuller, Holland Patent; John H. Williams, Remsen; Wm. P. Dodge, Prospect; W. E. Wolcott, Utica; Delegates to State League Convention, J. W. Hicks, W. E. Wolcott.

W. E. WOLCOTT.

Southern Fish in Northern Waters.

THROUGH the courtesy of the U. S. Commissioner of Fish and Fisheries, Hon. George M. Bowers, and that of Doctors Smith and Bumpus, in charge of the Biological Laboratory work at Wood's Holl, Mass., the writer was enabled to make some most interesting and valuable observations in the waters contiguous to the Wood's Holl Station, which was visited during August and September in behalf of the Division of Fishes, U. S. National Museum. Several days late in August and early September were spent in an examination of the shallow waters of Katama Bay, near Edgartown, Mass., and there, in sight of the small inlet from old ocean, were taken ten or more semi-tropical species of fishes, the majority of them never having been recorded north of Florida. The fishes were all young; some of them (the chætodonts, or angel fishes, the *Apogon, Holocentrus, Pseudopriacanthus* or big-eye, in its livery of bright red, and the snowy grouper) were beautifully colored. Two of these, the chætodonts and big-eye, had been recorded from the vicinity years ago. The snowy grouper had also been recorded from the New England coast. Following is a list of those new to our Northern fauna:

Groupers: *Epinephelus morio, E. adscensionis, Garrupa nigrita, Mycteroperca venenosa apua* and *bonaci,* and *Trisotropis brunneus.*

King of the mullets, *Apogon maculatus.*

Squirrel fish, *Holocentrus ascensionis.*

Surgeon fish, *Teuthis hepatus* and *bahianus.*

Rascacio, or poison groupers, *Scorpæna plumieri* and *grandicornis.*

Black pilot, *Eupomacentrus leucostictus.*

The groupers were comparatively rare, from 2½ to 3½ inches long; king of the mullets rare; squirrel fish rare; rascacio rare; black pilot rare; surgeon fish rather rare. Quite a number of snowy grouper, chætodonts and big-eyes were seined. These made a brilliant showing in the aquarium, where they were kept alive some time.

The presence of these Southern forms in Northern waters surprised us very much, especially when we considered how much these waters had been explored since the formation of the U. S. Fish Commission in 1871. Considerable Gulf weed (*Sargassum*) is drifted into this bay, and it therefore seems reasonable to suppose that these little fishes may be hatched in among this weed and drift with it to the far North. It is possible, too, that eggs are floated into the shelter of Katama Bay and the young hatched there. The Gulf Stream is one hundred miles off shore at this point.

Captain Vinal N. Edwards, collector for the Fish Commission, had charge of the seining operations, and science owes much to him for his indefatigable labors, extending over many years.

B. A. BEAN.

WASHINGTON, D. C. Nov. 30.

Three Things in His Favor.

MANCHESTER, O., Nov. 27.—*Editor Forest and Stream:* It is with pleasure that I send you a photo of Mr. Ed McNeil, with his latest catch of jack salmon. These fish were taken from the Ohio River, just opposite Manchester.

Every one in our village looks upon Ed as being authority on fish and fishing. Ed has three things to recommend him: He is a good boy, a good angler and a good business man. Having fought his way to the front he is to-day our leading grocer, doing a fine business, both in the wholesale and retail trade.

Mr. McNeil, with a party of friends, has just returned from a three weeks' outing in the wilds of Arkansas. They report having had a fine time.

C. W. C.

The Kill of a King.

A STALWART son of a race whose sun has set, holds firmly the birch canoe, a product of his own handiwork, carved at bow and stern, with strange scenes of camp life, and the stranger words that mean so much when a translation is given; while I with the stinted grace of the white man, succeed in settling myself in the seat prepared and made comfortable by a broad back covered with deer skin, the cushion fashioned from interwoven dried grasses. A strong shove that sends the frail craft out into the sparkling wavelets, my guide, Lomay, seating himself and using the paddles, all in one apparent movement alone, and we are off for the grounds. The net hangs from the stern within easy reach of my copper-hued boatman.

Such a morning! Keen and crisp the air. Winds that tickle into motion the surface of the lake. Green bedecked islands, whose shores, proud in their wealth of trees of fir, and blackened rocks snapping into purring foam the waters that quiver against them.

Dark are the shadows of the distant land, while spots of color, gliding on and then lost to view coming from other craft, each with its occupants intent on the sport of the day, and each possessing a distinct and vivid coloring that lends its charm to the scene.

Boldly my little birch is pushed by vigorous paddle strokes into the center of the lake, for we are bound for a place still far away.

It is early in springtime. The water is so cold that it requires no imagination to wonder that floating ice is not seen. While the fish held in this zone of chill must be active to keep from freezing, yet comes the disadvantage that the gaudy, dainty fly is no lure, so one is forced to offer a more substantial repast. Under these circumstances, use the small live minnow, on a single hook, to be sunk a trifle under the surface, well swiveled and with plenty of good line, a reel that runs well and can be relied upon, and a rod strong, not heavy, 8 to 10 ounces in weight. Two rods equipped in this manner give fair play with plenty of chances for a biting fish to free himself in case of any slight carelessness or a strike that is too light. We near the battlefield. Several small fish are taken, fresh baits are made as tempting as possible; and keeping just far enough from the shore, we glide on, still believing, while still retracing, for here it is that many a good fish has been captured. The winds are growing sterner in their strength, the whitecaps are larger, the wavelets are growing rapidly into real waves. Skill is required in the handling, and right well does Lomay, kneeling in the canoe and putting the strength of his muscles into every stroke, keep me safe from an ice-cold watery grave.

'Tis now a time when the small fry take to the more sheltered creeks and nooks, and our minnow seen flashing in its turnings is an attractive bait. The rod held in the left hand feels a moderate strike; but no sooner do I begin to reel in than a mighty whirr from the right hand reel causes me to pass the first rod to Lomay and leave it to him to capture or not as best he can. For now I know there will be a battle, and grasping the right hand rod I check suddenly the swiftness of the departing line. Then, with intense satisfaction, I see a magnificent jump far astern, and the sight of a beautiful landlocked salmon rewards me.

Steady, steady it now must be.

The fish strikes the water and darts away, luckily for me, in the right line of direction. Meantime Lomay has succeeded, I do not know how, in reeling in his line and still keeping the canoe rightly. He wastes no time in using a net, but lifts the fish into the boat, not waiting even to kill.

Now my beauty tires a bit, then spurts in another direction. Guiding as best I can, and swinging him completely over to the other side, he moves like a restive horse, trying to swim away with everything. But we are in deep water; I give him the butt, and he tires again, sullen in his wrath, sinking deeper, nearing the bottom. A sharp pull starts him from this mood. Again he flies from the top of a wave high into the air. All is ready for him; the line holds him safe when he touches the water. He tries pulling against all the opposing forces, seeking to make a run under the boat. Here he fails, as he is strongly held, and gradually eases away, until suddenly he dashes a short distance, immediately making his jump, shaking his grand old head in the effort to throw out the hook that holds him fast. Once more he fails and darts away, growing a trifle weaker in his rush. Now he is being reeled in. This time he is seen lying on his side. He looks as if soon he would be our "meat." But not so at all. As he sees the boat, with a powerful swing he rights himself and rushes like a frightened deer, bending the rod until it seems that it must break.

Soon the strain is too great for him. He stops for a meager respite, but no time is given and he is turned on his side, being slowly reeled in. The nearness to the canoe starts afresh his endeavors. With a tug that cannot be controlled, he makes a magnificent run far away toward the deeper water, pulling the canoe with him. Surely this is his last struggle, I think as I begin to wind in, but long before the line is half shortened he plunges upward, and as quickly down. No play can be granted. The line is made tighter; the butt is given, and a test between fish and tackle ensues, in which the tackle triumphs surely and slowly. On the surface he is seen, and near enough to try the net; but useless it is. As if he knew well that net, he gathers all his powers and darts away from it. Three times this same fighting is gone through with. At a fourth trial the net closes about him. He is lifted from his home, exhausted and panting. The spirit of fight still remains. Even the quick blow on his head from a heavy piece of wood has to be repeated before he gives up that wonderful gamy life; and as he quivering lies so, in rainbow lines the shades of coloring flash out, as if a halo of gorgeous tints should mark the death of a king, as king indeed he is, weighing 8½ pounds.

A long fight, a strong fight and a plucky death. Inch for inch marked the battle, one by one only had each counter movement been met. Lomay, the stoic, even grunts out "Good"—high praise from his lips—while I, content, tired by the exertion, rest, filling and lighting my briar, as smoother waters are reached, where soon beside a glowing fire each and every move of the struggle is talked over again.

So this day was a marked one, and now, as the king looks down at me with his real glass eye, as I see him almost alive on the wall of my den, I dream of the invasion of his domain and of his capture; and could he but speak, I feel would say, "I had fair play, even if kingdom and life were lost." So would I in sparkling wine drink to his memory in praise of his nerve, his work and the royal sport he gave.

F. M. JOHNSON.

BOSTON.

Landing Nets in Pennsylvania.

FOLLOWING is the full text of Judge Craig's opinion in the Pennsylvania landing net case:

Opinion.

THIS is a proceeding under section 1 of the act of Assembly of May 22, 1889, P. L. 267. It was conceded at the argument that the decision of the case rests with us, without the intervention of a jury; Com. vs. Waldman, 140 Pa., 89.

It is charged that the defendant violated the law in using a net, an appliance other than rod, hook and line, while catching trout. The uncontradicted evidence is, and we so find from the testimony, that the defendant did, on April 15, 1899, fish for trout in McMichael's Creek, Monroe county, Pennsylvania, using rod, hook and line, with fly and reel, and, after hooking a trout, further employed a landing net for the purpose of lifting it from its natural element and bringing it to shore, and putting it into his physical possession. Is this, the catching of a fish, by making use of a net, or any other appliance, except rod, hook and line, within the meaning of the act of Assembly?

The language of the act of Assembly is this:

"That, hereafter, no person or persons shall cast, draw, fasten or otherwise make use of any seine, drift-net, fyke-net, or net or nets of any other description, or use any other appliance, for the catching of fish, except rod, hook and line, in any rivers, streams or waters of this commonwealth," etc.

Manifestly, if we interpret the words, "rod, hook and line" within the limitation of their literal import, then it would be obnoxious to this act to use a reel, or fly, or bait, or bob, or sinker, or squid in connection with rod, hook and line, when fishing for game fish; for these are appliances for catching fish, in the general sense of the terms. Such interpretation would be contrary to the legislative intent, for it would practically defeat all catching of game fish. Such a construction would lead to absurdity; and it is not presumed that the Legislature intended their own stultification. Hence, it is held that, when the language of an act is susceptible of two senses, the sense will be adopted which will not lead to absurd consequences; Amer. and Eng. Ency. of Law, Vol. 23, page 362; Endlich on Interp. of Statutes, Sec. 925.

At the argument, it seemed to be conceded by the Commonwealth that the appliances we have named could be used, in connection with the rod, hook and line, in catching game fish without violating the statute. But the stress of the contention was made to rest upon the use of the landing net by the defendant, in getting physical possession of the trout after it was hooked, or, as the Commonwealth put it, in catching fish by using a landing net, in connection with rod, hook and line. Much argument was expended on the question, Was the fish caught when hooked, or was it not caught until it was put into physical possession of the defendant by means of a landing net? At first blush, this seems a question worthy of the best days of the schoolmen. Happily we are relieved from the niceties of words and abstract ideas by the testimony of experts in fishing. These were judges and lawyers and doctors and fish commissioners, and public officials, and men of large and small affairs, who had had long practical experience. The preponderating weight of their evidence is that a game fish is caught when hooked, and that the landing net is used, either conveniently or necessarily, for bringing the fish into the physical possession of the fisherman. Accordingly, we find the fact to be as thus testified to.

The argument is largely concerned with the definition of the word "catch." In construing it, we are to take the ordinary and popular meaning; Amer. and Eng. Enc. of Law, Vol. 23, page 326; Endlich on Interp. of Statutes, Sec. 76. But here we are not without perplexity. There are few words in the English language which have such a variety of meanings as the word catch. Webster's International Dictionary gives fifteen shades of meaning, one of which is "to take captive, as in a snare or net or on a hook, as to catch a bird or fish." The Century Dictionary gives twenty-two meanings of the word, one of which is "to take captive, as in a snare or trap; to take with a lure or bait, as to catch a fish." The Standard Dictionary furnishes thirteen meanings, one of which is "to take by trapping, or snaring; to take with a bait or by strategem, as to catch fish, game, etc." So, if we appeal to popular usage, as reflected in lexicons, we are left in uncertainty as to what the exact meaning of the word "catch" is in the act. A bear, or a skunk, or a rat, captured alive in a trap, under these definitions, may be said to be caught in the ordinary and popular meaning, although not in the physical possession of the trapper. So, a trout may be said to be caught when held by the hook, as well as when in the landing net or creel.

In construing this act, we must not forget that it is penal in its character, and therefore subject to general rule of strict construction: that "where an act contains such an ambiguity as to leave reasonable doubt of its meaning, it is the duty of the Court not to inflict the penalty; that where it admits of two constructions, that which operates in favor of life or liberty is to be preferred;" Endlich on Interp. of Statutes, Sec. 330. This rule would compel us to construe the doubtful phraseology of the act against the infliction of the penalty and in favor of the liberty of the citizen. As we have already shown that to catch a trout may mean either when it is hooked or when it is landed with a landing net, it follows that under the rule applicable to penal statutes we must adopt the construction most favorable to the defendant.

But, according to our view, it is not necessary to employ this rule of construction in the decision of this case. The phrase "rod, hook and line" is a very old one. In "A Treatyse of Fysshynge Wyth an Angle," by Dame Juliana A. Berners, edited 1496, we read as follows: "The beste to my symple dysercion wythe is fishynge, called anyglynge with rodde and a lyne and an hooke." And we find our Legislature using this same phrase, in what appears a technical sense, in the acts of May 16, 1878; June 3, 1878; June 10, 1884, and acts of May 22, 1889, P. L., 47, 50 and 64, and act of May 20, 1891. This phrase "rod, hook and line" is applied to the catching of all kinds of game fish in these various acts, and to all the waters and streams of the Commonwealth, including the waters of Lake Erie, bays, ponds and bayous adjacent thereto. We cannot believe that the Legislature, in using the phrase "rod, hook and line," intended so narrow and unreasonable a construction as is urged by the Commonwealth. So common and universal is the use of reels, fly-hooks, bait, bobs, sinkers and squids in fishing with rod, hook and line that we may take them to be included in the phrase "rod, hook and line," in ordinary and popular use. Therefore, if we construe the legislative language according to its popular acceptation, we are bound to hold that the appliances, or things just named, were understood and intended by the Legislature to be included in the phrase "rod, hook and line"; Phil. & Erie R. R. Co. vs. Catawissa R. R. Co., 53 Pa., 20; Endlich on Interp. of Statutes, Sec. 85. This is the natural and obvious import of the phrase, without resorting to subtle and forced construction for the purpose either of limiting or extending its operation. Possibly this construction will be conceded by the Commonwealth. But the contention is that a landing net is not of such common and universal use as to be included in the phrase "rod, hook and line." Certain it is that the landing net was in common use by fishermen as far back as 1653, for Izaak Walton, in his "Complete Angler," makes Piscator say: "But what say you now? There is a trout now, and a good one, too, if I can but hold him, and two or three turns more will tire him. Now you see he lies still, and the sleight is to land him. Reach me that landing net. So, sir, now he is mine own. What say you now? Is not this worth all my labor and your patience?" So, in Prime's "I Go a-Fishing," we find the following: "But when once you have hooked your fish, the light rod is vastly to be preferred, after becoming accustomed to handle it, whatever and wherever be the water. For the principle of the rod is in reality only this: That it is the home end of the line, stiffened and made springy, so that you can guide and manage it—cast and draw, keep a gentle pressure with it on the hook, so that the fish shall not rid himself of it, and finally lift him to the landing net." Again, in the "American Angler's Book," by Norris, the author says: "I have known anglers handle fish (trout) so well as to make a practice of slipping the hand gently down the leader, and then seizing them behind the gills, sometimes wearing a hand glove to insure a firmer grasp. Few, however, have sufficient skill and coolness for such dangerous practice. A landing net is almost indispensable when there is no convenient place for landing your prize on the bank, or when wading ashore would disturb the quiet of the pool." All the testimony in this case is to the effect that the landing net is, and has been, in ordinary, common and almost universal use by those who fish for trout with rod, hook and line. In our view, therefore, the landing net was as much within the legislative intent when using the words "rod, hook and line" as was the fly-hook, reel, bait and such like appliances.

To assist the correctness of the argument, let us consider what a landing net, is, and its use. The Century Dictionary defines a landing net as "a kind of scoop net used to bring to land or to hand a fish which has been caught." Substantially the same definition will be found in the Standard and Webster dictionaries. Its use is not to catch a fish separately, as they are caught in fyke and drift nets and seines; but its use is to land the fish after it is hooked. As we have already observed, a fish is caught when hooked. Hence, under this view, a landing net would be necessarily part of the act of catching, but simply a convenient means of obtaining physical possession. And, hence, also, the use of it, as used by the defendant, was not a violation of the letter or spirit of the act of Assembly. A landing net is useless as a separate appliance for catching fish; and is in no sense a complete appliance for catching fish, like a seine, drift-net or fyke-net when cast, drawn or fastened, or otherwise made use of.

The purpose of the Legislature in passing the acts relating to the catching of game fish is perfectly plain. It was to stop their indiscriminate and unreasonable destruction, so that the streams and waters might be kept stocked. Hence, the law limits fising to certain seasons and to certain means. The mischief was the extinction of game fish by means of nets; and the nets named are seines, drift-nets, fyke-nets and nets of like character. Landing nets are not named in any of the acts. Hand or cast nets are, in the sixth section of the act under consideration. But hand or cast nets are not landing nets. Then, can landing nets be included in the phrase "nets of any other description"? As we have already stated, landing nets are useless as separate appliances for catching fish. Therefore, they are not ejusdem generis with seines, drift-nets and fyke-nets, and cannot be included in the phrase "nets of any other description." For the rule of law is that where a general word follows particular and specified words of the same nature as itself, it takes its meaning from them, and is presumed to be restricted to the same genus as those words; or, in other words, as comprehending only things of the same kind as those designated by them; Endlich on Interp. of Statutes, Sec. 405. Hence, we are of opinion that landing nets are not included in the nets prohibited by the acts of Assembly. It seems clear to us, if the Legislature meant to prohibit the use of landing nets in fishing for game fish, when the landing net was in such common and almost universal use, they would have said so in plain and unmistakable language. The fact that they did not is persuasive that they did not mean to include landing nets among the prohibitions.

The diversion or sport of fishing is engaged in by many persons, and the policy of the Commonwealth has been to encourage the pastime. If we were to hold the law to be as contended by the Commonwealth in this case, we should, as shown by the testimony, destroy the very purpose of the Commonwealth. The construction we give to the act of May 22, 1889, will, in our opinion, best effectuate the intention of the Legislature. And this is what we are required to do; Com. vs. Fraim, 16 Pa., 163. Of course, if the law prohibited the use of landing nets in game fishing, in plain and unmistakable language, it

would be our duty, and we would not hesitate so to hold. But we think the fair and reasonable and just construction of the act of Assembly is plainly to the contrary.

The defendant has asked us to find a number of facts and to answer certain requests of law. Our answer is that the findings of fact and answers of law are fully covered by this opinion.

And now, Nov. 15, 1899, for the reasons above given, it is adjudged that the conviction of the defendant and the judgment against him be reversed and the proceeding in this case be set aside.

By the Court. ALLEN CRAIG, Pres. Judge.

"An Experience at Roberval."

Editor Forest and Stream:

My attention has been drawn to an article in your issue of 25th inst., under the heading of "An Experience at Roberval," from Messrs. C. P. M. Rumford and Robert R. Logan, complaining of the charges made in our account against them while on a visit to Roberval last summer.

I thought that by this time they had become reconciled to the objections they made to a settlement of an account presented them for camping charges in connection with a trip they took up the Mistassini River last summer, but since they have thought it necessary to air their views in your paper, it is only fair that the other side of the question should be known.

Those two gentlemen state that they visited the Lake St. John country two years since and went out camping under the arrangements of the hotel at the rate of $7 per day each, which is correct. This rate of $7 per day is a fixed arrangement, and covers the wages of two guides and the use of canoe that we provide each sportsman, and includes the cost of provisions and use of camping equipment for a trip—nothing extra being charged for the privilege of fishing on our waters.

Some months previous to their visit to Roberval last summer, Mr. Rumford wrote us, asking if the hotel and fishing territory were open to guests as in other years, and I replied that our hotels and fishing controlled by the proprietor were open to guests under the usual arrangements. Those two sportsmen came in among other arrivals at the hotel one afternoon in the month of August last, and were assigned to rooms, and the next morning they left the hotel hurriedly without saying that they were going out on our waters under their own arrangements. They left the house without seeking any information, mind you, and without giving us a chance to be interested in the trip, and owing to the multiplicity of letters we receive and answer, the correspondence we had with Mr. Rumford some time previous was overlooked. Upon their return to the hotel we presented them with a bill for camping charges for the number of days that they were out at the rate of $7 per day each, with an allowance deducted for the entire disbursements that we would have made in connection with the trip had we fitted them out. So much for police protection. Had they paid the guides the standard rate of wages, the outing, including the bill they paid us, would have panned out about $7 per day, but unfortunately for themselves, they had treated direct with the guides, unknown to the hotel, and I believe paid them twice what the men were accustomed to receive from us for their services. This is where the outrage comes in, and since it was their own creation they should not blame anybody else for their mistakes. Notwithstanding their plea of ignorance of existing circumstances and law, they were told that the fishing controlled by the proprietor was open to guests under the usual arrangements. They should, therefore, have made arrangements with us for their trip up river, but in order to have a cheaper outing than the hotel could afford to give them, they undertook, as they admit in their letter to your paper, to reduce the cost of the trip by treating direct with the guides, with the result above stated. They did not get permission from us to go out on those waters under such circumstances, and as far as I know, did not look for consent from anybody else.

Your correspondents state that they were allowed to believe that $5 per day, out of the $7 per day rate, went to the guides, and the balance was applied for provisions. The idea is ridiculous. If such were the case, where would the profit come in for the hotel? Do Messrs. Rumford and Logan expect that we should give everything for nothing? Whatever business or profession they follow, I am quite satisfied that they do not do everything for nothing. If they spent their vacation within the hotel, instead of camping out up river, would they expect us to figure out what the food, etc., they consumed cost, and allow no margin for profit in making our rates for board? It cost the proprietor a lot of money to establish the hotels at the lake and to secure the fishing rights he controls, and no true sportsman should expect us to do everything for cost price.

If we allowed sportsmen who simply stay over night at the hotel the day of their arrival for the purpose of making it a starting point, to take a trip on our waters under their own arrangements, it would be rather a generous way of doing business.

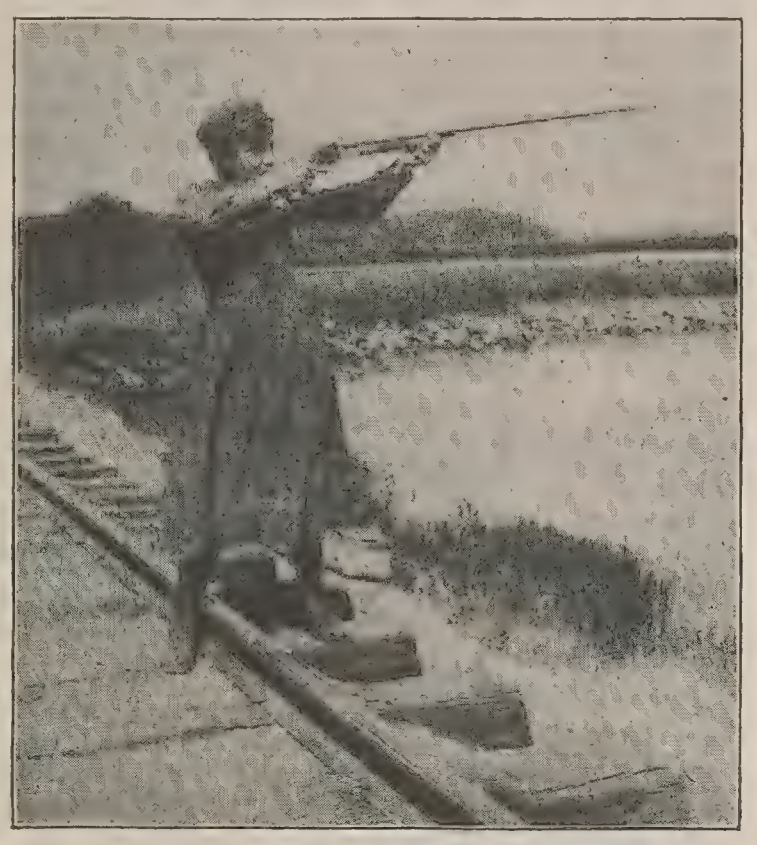
When Messrs. Rumford and Logan make the statement that the country is void of large game, it should be remembered that they are not in a frame of mind to bestow compliments on our institutions, and for their information and benefit I would say that after their departure from Roberval we fitted out other guests who went into the woods after fish and big game, and they returned reporting excellent luck in both directions. I might also add that one of our employees who was up to Lake St. John quite recently met many residents of the place who reported moose and caribou roaming around in large herds.

I trust that you will give this publication in your valuable paper, and that it will place us in a correct position before your readers.

H. G. BEEMER, Manager of Hotels.

QUEBEC, Nov. 27.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.



Fishing Up and Down the Potomac.

"Good Hunting."

KIPLING'S salutation of the jungle peoples is a fitting comment on the records of the week on and by Potomac waters.

The largest small-mouth bass of the season was taken in tide water at Analostan, or Little River, opposite Georgetown, just inside the causeway. The fish was 19 inches long, and plump, weighing 5 pounds 2½ ounces. Its mouth, stretched, would just accommodate an average lemon; a big-mouth of the same weight would take a fist. This bass carried spawn and the vent inflamed as in the spring season. It is interesting to note that both large and small-mouth have been taken in tide water carrying spawn in the fall. Whether these are prematurely cast and lost, or development checked when the hard weather comes, is not clear, as the Commission has had too little opportunity for observation with this fish in its new habitat.

This "top-liner" was taken by Samuel Kidwell and James Gallagher, with live bait. They caught fifteen

"HANDLES A ROD, GUN OR PADDLE."

fish, the smallest 1½ pounds, and all large-mouth except this one.

Another small-mouth of 5 pounds was reported taken at Sycamore Island, above Little Falls, but as on the following day it was quoted at 6 pounds 6 ounces, the record is spoiled. Abnormal growth of this sort has given to the fisherman a reputation he does not deserve, for investigation proves the taradiddle is always the invention of the man who did not catch the fish.

Occoquan continues to furnish famous strings of big-mouth bass, and also a mild sensation in a report that some of the citizens were using dynamite to capture fish. It is said that four sticks fired off below the town resulted in a total of half a dozen carp. This of course did

QUANTICO.

not measure the destruction, as the fish with ruptured air-bladders would sink, and indeed it is rumored that quantities of fish of all kinds and sizes were washed ashore. This may not be true.

No arrests were made, as it is claimed Virginia has no law against this outrage that has been legislated against in so many of the States. Two defenses were made by the guilty parties to their indignant neighbors. One that they wanted meat, and the other that they were tired seeing so many strangers coming down to rob them of their fish. This latter is unjust, since every party left more money in the little place than would have purchased the fish caught.

The bass were not their private property, but were put into State waters from the outside with appropriations levied on 75,000,000 people. Without the bass the little town would be deader than it is. With the reputation this season has given it it promises next year to be the most frequented place on the river. But there must be no more fishing with explosives.

The brutality of a method that destroys so much to realize so little so outrages public sentiment that it can never be practiced where more than two or three are gathered together.

Many of the little runs on both sides of the Potomac are being netted and furnishing so many barrels of bass that this market has been overstocked, and shipments are being made to Philadelphia and other outside points. The average weight of the catch is roughly estimated at 1½ pounds, though 5 and 6-pounders are not uncommon.

Prof. Wilkinson, who has been for thirty years an examiner in the Patent Office, and is the Dean of the corps, with his colleague Mr. Mason, tempted by the fairy stories of big strings of bass on the lower Potomac, went down to Quantico to have a try.

The great hotel there, with more than a hundred rooms, intended by the ambitious land company which erected it as a rival to Old Point, is standing, but slightly disfigured. Racked by the blizzard of last year, the artificial stone of which it is built disintegrated under a leak on the southern wall, and the end collapsed, settling to a mass of rubble, and has never been repaired. If one can overcome a nervous dread that the rest will follow suit before his holiday is done, there are still comfortable quarters to be found in it, and another season like the last will insure its restoration.

The present owner, Mr. Max Lansburgh, with other more profitable interests to claim his attention, is entirely indifferent to its condition, but there is much talk of organizing a club to be located here. It is so easy of access that if made attractive the great plenty of bass and other fish which has so advertised it this year will insure good seasons till poaching netters spoil it again.

The hotel contains several objects of interest, including a bed room set intended for Dom Pedro of Brazil, with his monogram on the canopy. The bed is a massive pile of carved curly walnut 14 feet high that cost $1,500. The front of the canopy is 3 or 4 feet deep, and there are niches for statuettes and insets of onyx in the pillars at the foot. The manufacturer failed to complete it within the time limit, and it was left on his hands. Mr. Lansburgh, with bright hopes of making of this a popular resort, secured it for the "best room," but it was never set up; indeed, it is doubtful if any ceiling in the house would accommodate the monster. The shadow of 1893 was already on us, and with another fond dream of that day this faded, but left this rack behind.

There was here, too, a pier glass of heavy beveled plate, with an elaborate crystal frame, which had been an attractive exhibit at an inaugural ball, and was valued at $2,500. Strangely enough, this sold under a little judgment, and was carried off; it probably cost more than the purchase price, $7.50, to load it on the vehicle that was to transport it over the country roads. All this has little to do with fishing, and yet the surroundings are a part of every fish we catch.

A half mile north of the town an outlet to a little marsh has been enlarged by an artificial canal, now nearly choked with water lilies, and into this on the swelling tide the bass pour twice a day and feed on the frightened smelt in the pocket.

If all the fish taken from this narrow channel this season could be at once restored they would so fill it as to resemble those Alaskan streams where one is supposed to be able to walk over fish as over pontoons.

Here Prof. Wilkinson's party, who were the last visitors here, took their fish and caught a goodly string. The high hook for the day was Howard, the landlord's son, who secured one of above 4 pounds, the heaviest of the season here, with hook and line. This was good eating, as was duly attested by Charles Hallock, Mr. Mason and the Professor, who discussed it with trimmings next day for lunch, and further testimony secured that the big-mouth bass is not to be distinguished from the little-mouth on the platter with your eyes shut. Prof. Wilkinson uses a rod with a history—a salmon rod of split bamboo about 18 feet long, one of the first made by Leonard, valued then at $100 and given to Mr. Hallock, by whom it was presented to the Professor more than a quarter century ago. He has never used any other since, and the rod has been neither re-wrapped nor varnished in that time. It is still in excellent condition and seems good for another century, which shows those authors are right who contend that with mild usage and care a rod ought to last a man a lifetime.

One of the most successful and ardent anglers of the season was a fifteen-year-old girl, whose portrait given shows her with another implement with which she is fairly expert. She has the advantage of unlimited time, but has the love of outdoors and probably more bass to her credit this year than most of the regulars. She handles a rod, gun or paddle with creditable skill, and is a first-rate helper to manage a skiff or land a fish.

There have been a good many ducks about, and canvasbacks and redheads have been killed within rifle shot of Washington. Just off from Arsenal Point the other evening Tom Taylor, Jr., shot at what he thought was a duck, a fisherman, but it proved to be a wanderer from Labrador—Bruennich's murre (*Uria lomvia*), one of the auks. It was a beautiful bird, three-quarters grown, in splendid plumage, but emaciated. It is seldom found south of New York, though three years ago they were picked up in Ohio and even South Carolina. This bird, sometimes called the foolish guillemot, for its feet are so far back it moves with difficulty on land and can be killed with clubs, forms an important article of diet with the Esquimaux. The books speak of it as having dark, tough meat, but Dr. Palmer, who collected the specimens in the Smithsonian, and who has dined off them often in their Arctic home, declares it to be excellent eating when young and plump. It is no indication of a severe winter to follow to find so unusual a visitor, for, as often as is asserted to the contrary, the animals know no more about next month's weather than our bureau, and the best this can do is to tell us what the climate has been for a series of years, and we can on this if we like make our own predictions, based on periodicity or sun spots; but all the rest, including the almanac maker's, are like those of the hop.

A present storm may drive the birds of the air, but they worry no more over those to come than over the whereabouts of Aguinaldo. HENRY TALBOTT.

The New York Oyster Commissioner.

IN some paragraphs concerning terms of State officials expiring during the last year of Governor Roosevelt's term, the Albany Journal has this:

"The terms of all five of the Fisheries, Game and Forest Commissioners will expire on April 25. They are: Barnett H. Davis, of Palmyra; William F. Weed, of Pots-

dam; Charles H. Babcock, of Rochester; Edward Thompson, of Northport, and Hendrick S. Holden, of Syracuse. There has been some talk of abolishing the present Commission and appointing in its stead a single-headed Commission, but thus far it has not got beyond the point of suggestion. Governor Roosevelt wants a thoroughly effective department for the protection of fish and game, and the forests, and should he become convinced that by centering the authority in one official he could secure better results than are obtainable from a Commission of five members, he will, in all probability, recommend the change."

If we could have the ear of Governor Roosevelt we should seek to impress on him the great advantage to public interests reasonably sure to result from separation of the oyster planting and general sea coast fishery business from all connection with the Fish, Forest and Game Commission. This body is organized with a dominant regard to the promotion of sport; and its propagation of food fishes in interior fresh waters, however useful in itself, or whether its practical effects do or do not justify the large annual outlay under supervision of five high-priced Commissioners, is rather an incident than a real object of the work which the Commission aims to carry on. Without entering on a discussion of this work, it is enough to say that the market value of all the fresh-water fish sent to New York is hardly a tenth part of the value of the oysters alone there marketed, to say nothing of the other products of salt waters. And the taking of those products is a matter of business, into which the element of sport does not enter. To manage and help develop these extensive business fisheries, employing a small army of men and yielding annual values that already run up to millions, there should be one man of practical experience and knowledge, who should have nothing to do with the Forest, Fish and Game Commission. If economy be the watchword, as it should be, two single-head Commissions of competent men could do all the essential work of the present five, and better subserve the interests affected, whether of sport or business. Here is an opportunity to serve the people and save money.—Greenport (Long Island) Watchman.

New York State League.

The annual meeting of the New York State Fish, Game and Forest League was held in Syracuse on Thursday of this week. A report of the proceedings will be given in our next issue. In a notice inviting the membership of clubs, Secretary Gould says:

Seneca Falls, N. Y., Nov. 25.—You will please to take notice that at a regular annual meeting of the New York State Fish, Game and Forest League held Dec. 8, 1898, it was duly resolved that the Secretary correspond with representatives of all associations who have been identified with the old State Association, and request that if it be their desire to continue their connection with the present Association, they should send to the said Secretary the list of their officers and the number of their membership, together with the dues for the ensuing year. And further, that the Secretary be empowered to inform them that in the absence of any heretofore expressed intention on their part to continue their association with the new organization all dues due and payable prior to Dec. 1, 1898, are remitted.

Please comply with the terms of this resolution at once.

Very truly yours,

Ernest G. Gould, Secretary.

"Speaking of Dogs."

Well, "speaking of dogs," here is a story Capt. John Codman tells in the New York Times:

Many years ago I was the second mate on the ship Carolina, of Boston, commanded by Capt. Stephen Lemist. He had on board a fine black, shaggy Newfoundland dog called Neptune. Nep was the pet of all hands as well as of his master. He had the full liberty of the quarterdeck and sometimes availed himself of it by carelessly walking about on the taffrail. We were bound to New Orleans, and were being towed up the Mississippi in company with four other vessels. Nep was walking on the rail, as was his occasional custom, when he unfortunately lost his balance and fell overboard. It was impossible to stop without disarranging the tow, which the captain of the tug would not consent to do. So Capt. Lemist and the grief-stricken crew were constrained to leave the dog to his fate. For a while he swam after the fleet, but finding that he could not keep up with us, he struck out for the western shore of the river, seeing that he was nearest to that side. The only satisfaction that we had was that his life was in no danger, for we were sure that he would reach the land. As for ourselves, we mourned that we had forever parted company with our dear shipmate, and the captain, as I can see him now, laid his head upon the binnacle and sobbed like a child. We were about fifty miles below New Orleans at the time of the accident, and in a few hours were berthed at the levee, where we remained for three days discharging our cargo. A freight of cotton and tobacco for London was engaged, and we were towed up to Lafayette, some three or four miles above, to take it in, and were berthed the third outside in a tier of vessels, the cargo being carried on planks over the decks of the others. One morning after we had been there two days, as we were busily engaged at our work, to our utter astonishment Nep walked on board!

It is almost needless to say that our joy equaled his own. Wagging his organ of recognition, as a dog's tail has been so aptly termed, and crying in a dog's language of delight, he jumped upon every one of his old friends, entirely ignoring the stevedores, whom he did not know, and then rushed down the companionway in search of the captain, who did not happen to be on board. Then he came on deck dejected and wobegone, taking no further interest in any of us beyond casting about his inquiring looks. I expect to be believed, for I am telling the truth, when I say that the big tears stood in his eyes. The captain had gone ashore to his consignee's office in the city, as the chief mate knew. "Come, Nep," said he; "come along. Nep understood him readily enough, as he jumped on the stage over the other vessels' decks and followed him down to the office, where he was clasped in his fond master's arms. There is not a particle of fiction in this pathetic story. How Neptune found his ship was beyond our ken; we merely guessed that he had traveled fifty miles up the river till he came to the ferry, crossed over to New Orleans and then found his way up to Lafayette, walked over two tiers of ships and reached his old home again.

How did he find it? He yearned to tell us, for he knew that it was in our minds to ask him. But, alas! he could not speak. He was denied the gift that God has given to so many human brutes who have immortal souls, while he, when "life's fitful fever" was ended, went back to dust whence all of us came. But who knows if this is true? Why should a dog not be immortal because, although with two legs more than a man, he happens to have no voice, and why should all men be immortal because they can stand up on two legs and make more noise than dogs from their mouths?

New Publications.

"Just About a Boy."

Readers of this journal will remember the charming chapers "Just About a Boy," signed El Comancho. They will remember how much of nature, whether it was wild nature or human nature, appeared in these chapter, and a great number of them will recall that they were heartily in sympathy with the Boy, who was the simple hero of this pleasant story.

Those who at that time read the chapters in Forest and Stream will be glad to have them in permanent form and to know that the book has been published by Herbert S. Stone & Co., of Chicago and New York. As a specimen of book making the volume is very attractive; but after all it is the matter found in the volume which appeals to us most strongly. A good book handsomely gotten up is doubly good, but a poor book handsomely gotten up is doubly bad, for it disappoints expectations which have been aroused.

The Boy was discovered fishing, by a fisherman on a fishing trip, and the common interest of boy and author then and there created a bond of sympathy which later took them over many miles of country, up and down rivers, over prairies, across deserts and to mountain tops. They shot, they fished, they trapped, they hunted bees; and at last, after many adventures, happily because simply told, they came to their home.

There is much in the volume which treats of the lore of outdoor life, and it is pleasant and profitable reading, not only for the profit that comes from the pleasure, but also for that which comes from instruction pleasantly and wisely given.

The author has had a wide experience over the West, from the Missouri River to the Pacific. The period treated of is fifteen or twenty years ago, during the transition between the wild and unsettled West and the spread of population away from the railroad and into the mountains.

The volume may be commended to boys of any age, and the old boys are likely to enjoy it quite as much as those whose age is nearer that of the hero of the book. Its tone is good, and it can only do good.

Wild Life in Hampshire.

Many of the angling readers of Forest and Stream will recall the name of Geo. A. B. Dewar, author of the book of the "Dry Fly," and will remember its pleasing style. These will be glad to learn that J. M. Dent & Co., of London, have just published for Mr. Dewar a volume on "Wild Life in Hampshire Highlands."

The book treats of outdoor life in England and is written in a very charming style. Mr. Dewar takes his readers through cultivated fields and pastures, and stretches of woodland and along delightful trout brooks, and tells them what he sees there and much about the ways of the birds and the animals. Most interesting of all, perhaps, is what he says of the great bustard, a bird which has become extinct in the British Isles. He quotes from Chafin as having seen in Hampshire twenty-five bustards in 1751, and from Gilbert White's diary and that of his brother Henry, of seeing flocks of these birds about 1780.

In Hampshire, in winter, is seen the woodcock, that great bird nearly twice the size of ours, though of course they are not abundant. The author discourses learnedly on the pleasing flavor of the woodcock's trail.

Many of the mammals receive attention at Mr. Dewar's hands, among them the badger, which is still fairly abundant.

The volume is beautifully gotten up, is illustrated with seven full-page photogravures and is from all points of view attractive.

AS A CHRISTMAS GIFT.

The Forest and Stream—in a year's subscription—is an appropriate and sure to be appreciated gift for a father, husband, son, brother, cousin, uncle, nephew, or one's pastor, lawyer, pupil, teacher or friend. The giving will be for fifty-two weeks. And with the paper may well go, for this year's Christmas, one of the large engravings "Alert" (moose), "The Challenge" (elk), "What's That?" (antelope), "Listen" (blacktail deer), "Close Quarters" (Mr. Osthaus' painting of Ripsey on point). These are on plates 12½ x 19 inches, on paper 22 x 28 ("What's That?" is slightly smaller). Price of engravings $3 each, or by a special rate the Forest and Stream for one year and any one of the engravings will be sent for $5.50.

Yachting.

A Yachting Experience.

I was thinking hard the other night of last summer's experience on Toronto Bay, of what we had done, and what we might have done, of this exciting incident, and of that flat event, until my thoughts took me back to that day in July when our bay was the scene of the worst storm that ever swept the port.

Why the Storm God saw fit to break out that bright Saturday afternoon when the harbor was alive with craft of all sorts, sail and steam, skiff and canoe, when the steamers groaning with their living loads were leaving for the different resorts, and when thousands of excursionists, young, gay, jolly and thinking only of pleasure, each and all in their own way, took to the water for an afternoon's sport; why I say the Storm King let loose the vials of his wrath on that bright day, I do not know, but the result was terrible, and to me, and to us aboard of Vivia, a day ever to be remembered.

It was the day of the race for the Prince of Wales' cup, and Canada and Vivia lay bobbing at their moorings at the Royal Canadian Y. C., like two graceful ducks, with mainsails set and club topsails aloft and jibs sent up in stops.

I was aboard Vivia. The air was light out of the southwest, and to the casual observer it was an ideal day for yachting, but to us whose duty it was to keep "an eye to weather" there was an ominous look in those clouds to the west and north, and there was a hazy blue to the south'ard that made us feel conscious of coming trouble.

Our course was from a buoy off the town club over to the Island, back to town and, passing all buoys to starboard, go out by the Eastern Channel, round the Island and home through the Western Gap, finishing at the town club.

The start was to be made at 3 o'clock, and at 2:30, at the sound of the half-hour gun, we slipped our moorings, as did Canada, and set off for a run down the bay.

As 3 o'clock approached those clouds were coming home like fun, the haze was thicker, and to the south a long bank of angry blue-gray clouds showed clear above the horizon. We all felt it was coming, and shrouds, main and topmast runners, stays, etc., were all given one more look to, and our big topsail was eyed thoughtfully. However, when you are racing you take chances, and as we saw Canada stuck to hers we decided to risk ours, and to lick Canada or take the consequences.

The five-minute gun saw us maneuvering for the line, and to save time, let me say at once we got away first, breaking out our foresail and small jib topsail as we crossed, then hauling our wind, stood close on starboard tack for the Island buoy. Canada was soon after us, and together we began to foot fast in the now freshening breeze. Vivia, no slouch at any time, found the weather to her liking, and was just walking through it, sending the smother flying from her bows and more than holding Canada.

The clouds to the south had become condensed, the whole southern sky was a mass of black, threatening storm, and the two yachts with decks awash were tearing along. As we approached the buoy and eased sheets as we rounded for the run back to town, we took in our foresail and set a large balloon staysail, a great drawing sail, and with this and everything else pulling at its best, we raced on through it.

Along close in our wake came Canada, taking in her jib topsail and setting balloon jib. What a foreground she made (flying through the water like a thing of life) to the terrible blackness behind her. Why were we not warned? Why did we carry on and put those boats to the strain they were about to be subjected to? Why risk spars, boat, life, perhaps? Why? Because the spirit of adventure had got hold of us, we were ahead, and were going to stay there if we could, and what true yachtsman will blame us? And we had every confidence in our skipper, and he in us, and we knew our boat.

Then came the deluge. The last thing I remember seeing of Canada was, upright and graceful, coming down on us like a race horse, and then the squall took her. Over she went, and over further; with a crash the topmast went over the side, sending the topsail in a tangle flying far out to leeward, and then the mast below the hounds, and again just above the deck. That balloon jib was too much for her, and when they tried to bring her to the wind she would not come with that great sail forward; everything went, and Canada was a wreck.

And how about Vivia? We just had time to see Canada's plight when we were caught. Oh, that club topsail! Over went Vivia, decks awash, and almost on her beam ends. Fearing to bring her up with the sail pressure we had aloft, helm was put hard up and we kept her before it. How she tore through it, smothered in a rush of leaping, angry water. Halyards and sheets were let fly, and that great topsail was got under the lee of the mainsail and left to hang there. Of course, as luck would have it, the sail was set to leeward of the peak halyards, and we could not get it in to weather. With boom eased off we got her going dead before it. Nothing gave, not a sheet or tack parted, and Vivia, relieved of topsail and balloon foresail, under mainsail and jib alone, was tearing along covered with foam, flying through the heavy sea running, at terrible speed; ahead of us not half a mile away the line of city docks. We kept her full and let her scud with the topsail still hanging, doing no harm under the lee of the mainsail.

The next thing was to get her about and "it" off her. We took our time and kept cool. We must not miss stays with those docks under our lee; jib sheets were let fly, main sheet brought in, and up she came, game and full of life. Then, as she hung in the wind, the rip and roar of the storm was felt to the full, and Vivia trembled and shook from stem to stern, the waves breaking clean over her and coming aboard clear and green. The jib was held on to and mainsail eased, and that big topsail, now to weather where we could get at it, was safely lowered. Then gathering way, off we raced and over we went, sending up a churn and smother of splashing, whirling water and throwing the spray of it clean over the main peak. Oh, you yachtsmen! Is there anything that comes anywhere near the sensation of the "feel" of a well-found, well-handled yacht in a gale of wind, as you

go racing through the rush of ever-varying sea, over this, taking that abroad, and through the next with scuppers awash, hanging on with your eyelids, the wind whistling and shrieking through the gear above!

It was a grand day, and as the force of the storm gradually lessened we kept Vivia running up and down the bay, till the worst was over, and then clearing up the tangle of gear and coiling down, when all was in hand keeping hard away, we rounded the buoy off Town Club, and for the first time had a chance to see what had been the result to others.

From the big schooner Oriole down, every boat under canvas had doused everything, with the exception of Beaver, with Mr. Jarvis at the stick. He hove to till the worst was over, and under scandalized mainsail took his anchorage at the Royal Canadian Y. C. Monita, Toronto, Merrythought and many more also sustained more or less damage. The number of craft upset were many, and so fierce was the storm that one poor fellow was carried bodily off the end of the waterworks dock and drowned.

We continued the race, and after having a pretty rough time of it in the heavy sea running out in the lake, finished in due course.

Vivia was none the worse, and we felt pardonably proud of our tight little ship. GEO. E. MACRAE.

TORONTO, Nov. 28.

A Long Cruise.

THE small power craft driven by some form of naphtha engine is to-day so much of a necessity that it is difficult to say which of its many forms is the most useful. In its original form, of a power tender for yachts in place of the rowing cutter and gig, it has proved almost invaluable to yachtsmen, and has permitted the general use of deep draft yachts. As a pleasure boat, the open naphtha launch has made its way to all inland and coast waters, and has brought in many new converts to yachting. One of the greatest boons it has brought to yachting is the small cabin cruiser, with its cheap fuel and limited attendance in the form of skilled labor as compared with steam. There is hardly a limit to the cruising which may be done in American waters at a small expense in a properly designed naphtha yacht. The following account of a cruise is from the St. Louis Globe-Democrat:

A trim and well-equipped yacht came down the river yesterday forenoon and moored at the foot of Carr street. She attracted little attention until it was learned that she was making a remarkable voyage. The craft belongs to Charles G. Burgoyne, of New York, a member of the Halifax River Y. C., of Florida. The trip is remarkable, not only on account of its length, but on on account of the extreme points that the yacht has reached, or will reach, in the American waters. The little craft, which is named Sweetheart, is 80ft. long, 15ft. beam, and is a twin-screw propeller, the motive power being two gasoline engines. She is of light draft, but is powerfully built, with a close cabin.

But two passengers are on the boat, Mr. Burgoyne and his wife, who are making the voyage entirely for their own amusement and delectation. The crew consists of four persons, the captain, a sailor, engineer and cook.

The party left Dayton, Fla., May 4 last, and sailed up the Atlantic coast, sometimes inside and at other times outside of the numerous islands that line the coast, until New York was reached. There they stopped for a short time, after which they proceeded up the Hudson River to Troy, thence by the Erie Canal to and through Lake Ontario and down the St. Lawrence River to Tadousac. From that point the party proceeded up the Saguenay River to Chicoutimi, the head of the navigation in the stream, and the extreme northern point reached by boat in the St. Lawrence basin.

From that point they returned to Richelieu, Canada, the mouth of the Sorel River, the outlet of Lake Champlain. Here another side tour was made up the Sorel River into Lake Champlain and back again to the St. Lawrence River. The trip was then made up the St. Lawrence, through Lake Ontario, the Welland Canal, Lake Erie, the Detroit River, Lake St. Clair, Lake Huron and Lake Michigan to Chicago. From Chicago the party proceeded through the Illinois and Michigan Canal to La Salle, thence down the Illinois River to Grafton, and on to this city. The tourists will remain here for a few days and they will then proceed on to New Orleans, and thence along the Gulf coast to Key West, Fla., along the eastern coast of Florida 400 miles to Dayton, the starting point.

No serious accident has occurred to the little boat during the voyage, but a number of little mishaps have delayed the progress of the tourists at various points. The craft was blown ashore in Indian River, Fla., where she remained about three days, when she was put back into the river and proceeded on the way undamaged by the experience. Mr. Burgoyne said the trip had been a delightful one and he expected to make it again next year, but that he was in favor of going the other way next time. He proposes to ascend the Mississippi River in the spring, spend the summer on the Northern lakes, and then sail down the Atlantic coast in the fall. The party is enjoying the best of health. They expect to reach Dayton in about a month.

Capt. George Tompkins, of the gasoline yacht Bonnie, who reached his home at Marcus Hook on Nov. 27, gives a graphic account of the burning of the craft on Saturday, near Baltimore, and his thrilling escape. The Bonnie was owned by James Austin, of Lansdowne, and had been on a five weeks' cruise along the South Carolina coast. The captain was bringing her home. Near Baltimore the yacht put in at the Columbia Iron Works for repairs, as the result of a break-down, and then started out again. At North Point the gasoline ignited, and the flames spread so rapidly that efforts to get assistance proved unavailing. The Bonnie burned to the water's edge and sank. A tug arrived in time to rescue Capt. Tompkins, who was taken to Baltimore. The Bonnie was 45ft. long, and was attached to the Corinthian Y. C. fleet. She carried a large quantity of ammunition and sporting paraphernalia, which were destroyed. The captain was forced to leave the yacht, after vainly attempting to fight the flames, for fear of an explosion.—Philadelphia Record.

New York C. C. One-Design Class.

As a natural consequence of its location directly adjacent to the Lower Bay, of its large membership, and the development of the sailing canoe into an extreme racing machine, the New York Canoe Club has of late years gathered a large fleet of single-handers and small yachts. The type of canoe in use in the early years of the club, able in model, staunch in construction, and better fitted than any other craft of its size for work about New York Harbor, the Kill von Kull, Raritan Bay and the Shrewsbury, has been exterminated by the bath-tub racing machine, and this latter craft has so little to recommend it to any but the few racing enthusiasts that the majority of old canoeists have been forced to seek craft which are in no sense canoes. It was this demand for a craft of sufficient size and power for the Lower Bay, and yet suitable for the requirements of an old canoeist, which produced the successful La Gloria, still owned in the club. Several attempts have been made by the club to establish a one-design class of small yachts, 15-footers or something similar, which would prove popular for the club members, the requirements being primarily a boat of light draft, able enough for rough water, as in cruising across the Lower Bay and up the Shrewsbury, and fast enough for class racing. These experiments in several classes of the scow type have not proved successful.

For several years past Mr. C. B. Vaux, one of the oldest members of the club and of the A. C. A., has owned a small sloop, Eileen, designed by Wm. H. Hand, Jr., of New Bedford, and has used her constantly about Gravesend Bay and the Lower Bay, as well as for longer cruises on Long Island Sound. This boat has proved so satisfactory in every way that Mr. Hand has been called on to build a new one-design class from the same design, with such alterations as experience has suggested.

The new boats, whose lines and sail plan are here given, are intended for single-handers, to be easily handled by one man, and to give accommodation for two or three on short cruises. Owing to the shoal water at places in Gravesend Bay and up the Shrewsbury, in Great Kills and other nearby cruising waters, the draft has been kept down by the use of a centerboard, but this houses in the keel so as to leave the cabin clear of a trunk. The model itself is eminently able and seaworthy, with easy lines below that promise fair speed. With the iron keel it is practically non-capsizable.

In the heavy fall gale of 1898 Eileen, at her moorings off the club house, struck on an old anchor at low water and with a heavy sea running, and her whole bottom was pounded in. She had, however, an air tank in each end which kept her afloat with decks just awash for over a day, until the gale moderated and she could be towed ashore. The new boats will have similar air tanks, of galvanized iron, of a capacity ample to float the iron keel.

While in so small a yacht the headroom is necessarily limited, the cabin has plenty of length and breadth, and to a man who began his cruising by sleeping below decks in a Rob Roy canoe and later found ample room in a canoe-tent pitched between the masts of a 16 by 30 canoe, the question of room appears very different from what it would if he had begun in a keel cutter. The cabin will be dry, snug and cozy, all that can be expected in so small a yacht.

The construction calls for a plank keel 2½ by 8½in. amidships, tapering into a stem and sternpost, each 2¾ by 4in., all of white oak. The frames are 1 by 1in., steamed oak, spaced 12in., with bent oak floors of the same size, each 3ft. long, across the keel forward and aft. This method has been much used about Buzzard's Bay, and has proved very satisfactory, being strong, light and durable. Over the iron keel the floors are sawn from 2¾in. oak plank, six in number, the keel bolts, of ¾in. iron, passing through the floors and being set up with nuts over heavy washers. The deck beams are sawn from oak plank, the main beams, at partners, fore end of house and after end of cockpit, being 1¾ by 1¾in., the others sided 1in. and moulded 1⅜in., all spaced 12in.

The clamps are of oak in single lengths, 2 by 1½ amidships, tapering to 1½ by 1½ at the ends. The bilge stringers, of yellow pine, 1½ by 1½, run in single lengths from the stem to the transom.

The planking is of white pine, which the builders have found more satisfactory than cedar, finished ⅝in. thick. The deck is also of ⅝in. pine, covered with canvas laid in shellac. The sides of house and cockpit are of ¾in. quartered oak, the cabin roof being of canvased pine, like the deck. The floors of cabin and cockpit, the seats in cockpit and the cabin bulkhead are of cypress, bright finished, and the cabin doors are quartered oak with cypress panels. The centerboard pennant enters the cockpit through a galvanized iron pipe. The yacht steers with a tiller.

Length—		
Over all	28ft.

Sir Thomas Lipton's Impressions.

THE current number of the North American Review contains an article by Sir Thomas Lipton, entitled "After the Yacht Race," in which he writes as follows:

"I went to America with high hopes of winning the Cup, and with the expectation of a friendly reception. My hopes have been disappointed, but my expectations have been far exceeded. Never can I forget the thousand and one acts of good will shown me during my stay in American waters, nor the multitude of friendly faces that watched my departure from her shores. I did not win the Cup, but I did secure a much better token—that of the abiding brotherhood of our two peoples.

"It was my good fortune to be present at the welcome given to Admiral Dewey, and to have a place in that wonderful procession, for which the two jubilee processions in London had only partially prepared me, so that I had before me this great object lesson of America's fervent patriotism and of America's generosity of good feeling toward myself as the representative of another country. It was impossible not to be impressed by the one sentiment and the other, and doubly so by their existence in harmony together.

"Shamrock bore her name with a purpose, yet she had no warmer wishers for her success in Ireland than she had in England, in Scotland or in Wales. She had the colonies, too, to wish her good luck. She rode triumphantly over any seas dividing our own peoples; she gave us solidarity at home. Perhaps the uses of the race did not end wholly with this agreeable example of unity between the three kingdoms, or with the amity it exhibited between England and America. If the Book of Job had to be written again, a windless day off Sandy Hook, while two yachts were waiting to pit against each other their vast expanse of sail, might serve the purpose of the allegory. That was a school of patience in which it is something to have graduated, as did we who planned the race, and as did those who assembled to see it.

"I have really nothing to add, except one more most grateful acknowledgment of all the pleasure and instruction I derived from the whole episode—a pleasure with so many ramifications than the failure to lift the coveted Cup seemed hardly to diminish it."

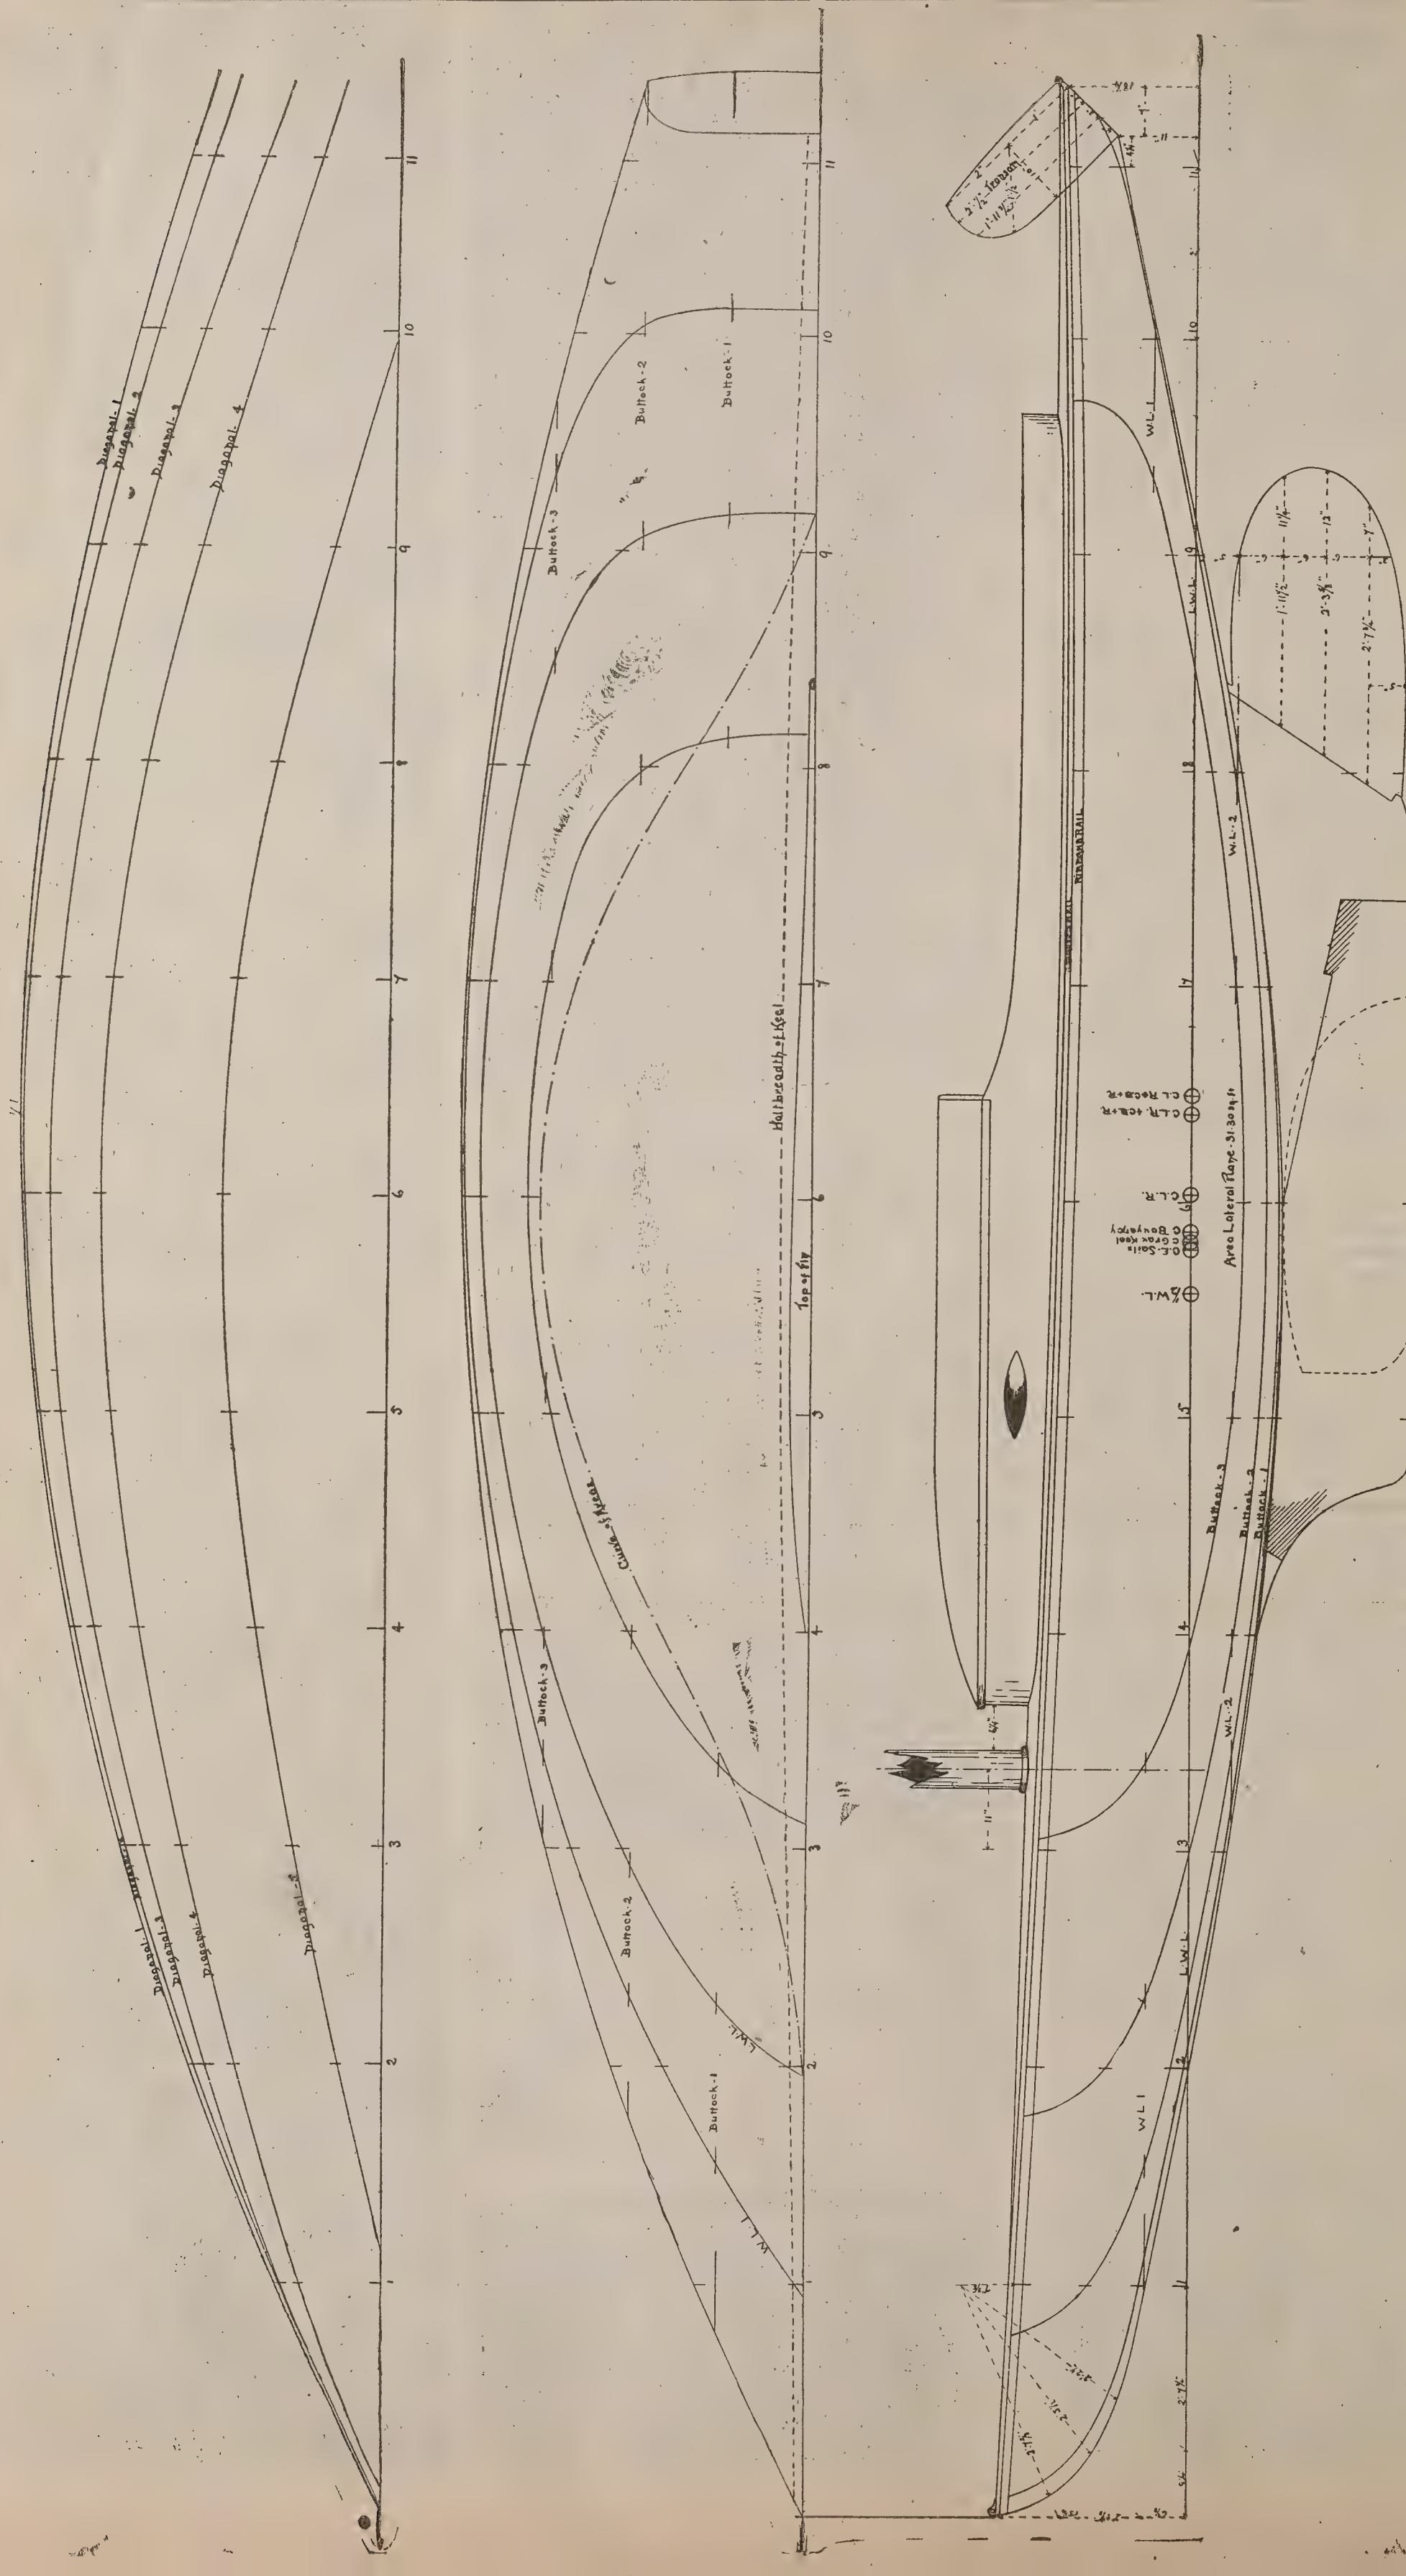
YACHTING NEWS NOTES.

Capt. Cornelius Witworth McKay, the veteran yachting reporter, of New York, died in that city on Dec. 1 at the age of sixty-six. He was born in New York, but grew up in the Boston shipyard of his father, Donald McKay, the famous builder of clipper ships. He was educated as a naval architect, studying for a time in Europe, and he was engaged in shipbuilding and also followed the sea as a ship master. About twenty years ago he, with the late Capt. Coffin, was noted as a yachting reporter for the New York daily papers, his technical knowledge of naval architecture and seamanship qualifying him for this work. From 1889 to 1893 he was an inspector of vessels at the port of New York. He was a man of magnificent physical proportions, attractive manners and a ready writer on all nautical topics.

Read Bros., of Fall River, have in hand an auxiliary schooner for Rear-Com. A. Homer Skinner, Rhode Island Y. C., to replace the sloop Ramallah. The new boat will be 57ft. over all, 40ft. l.w.l., 14ft. beam and 6ft. draft, with two gasoline motors of 8 H. P. each, located amidships. There will be a main cabin 10ft. long and two staterooms, the headroom being 6ft. 5in. The sail area will be about 1,800 sq. ft.

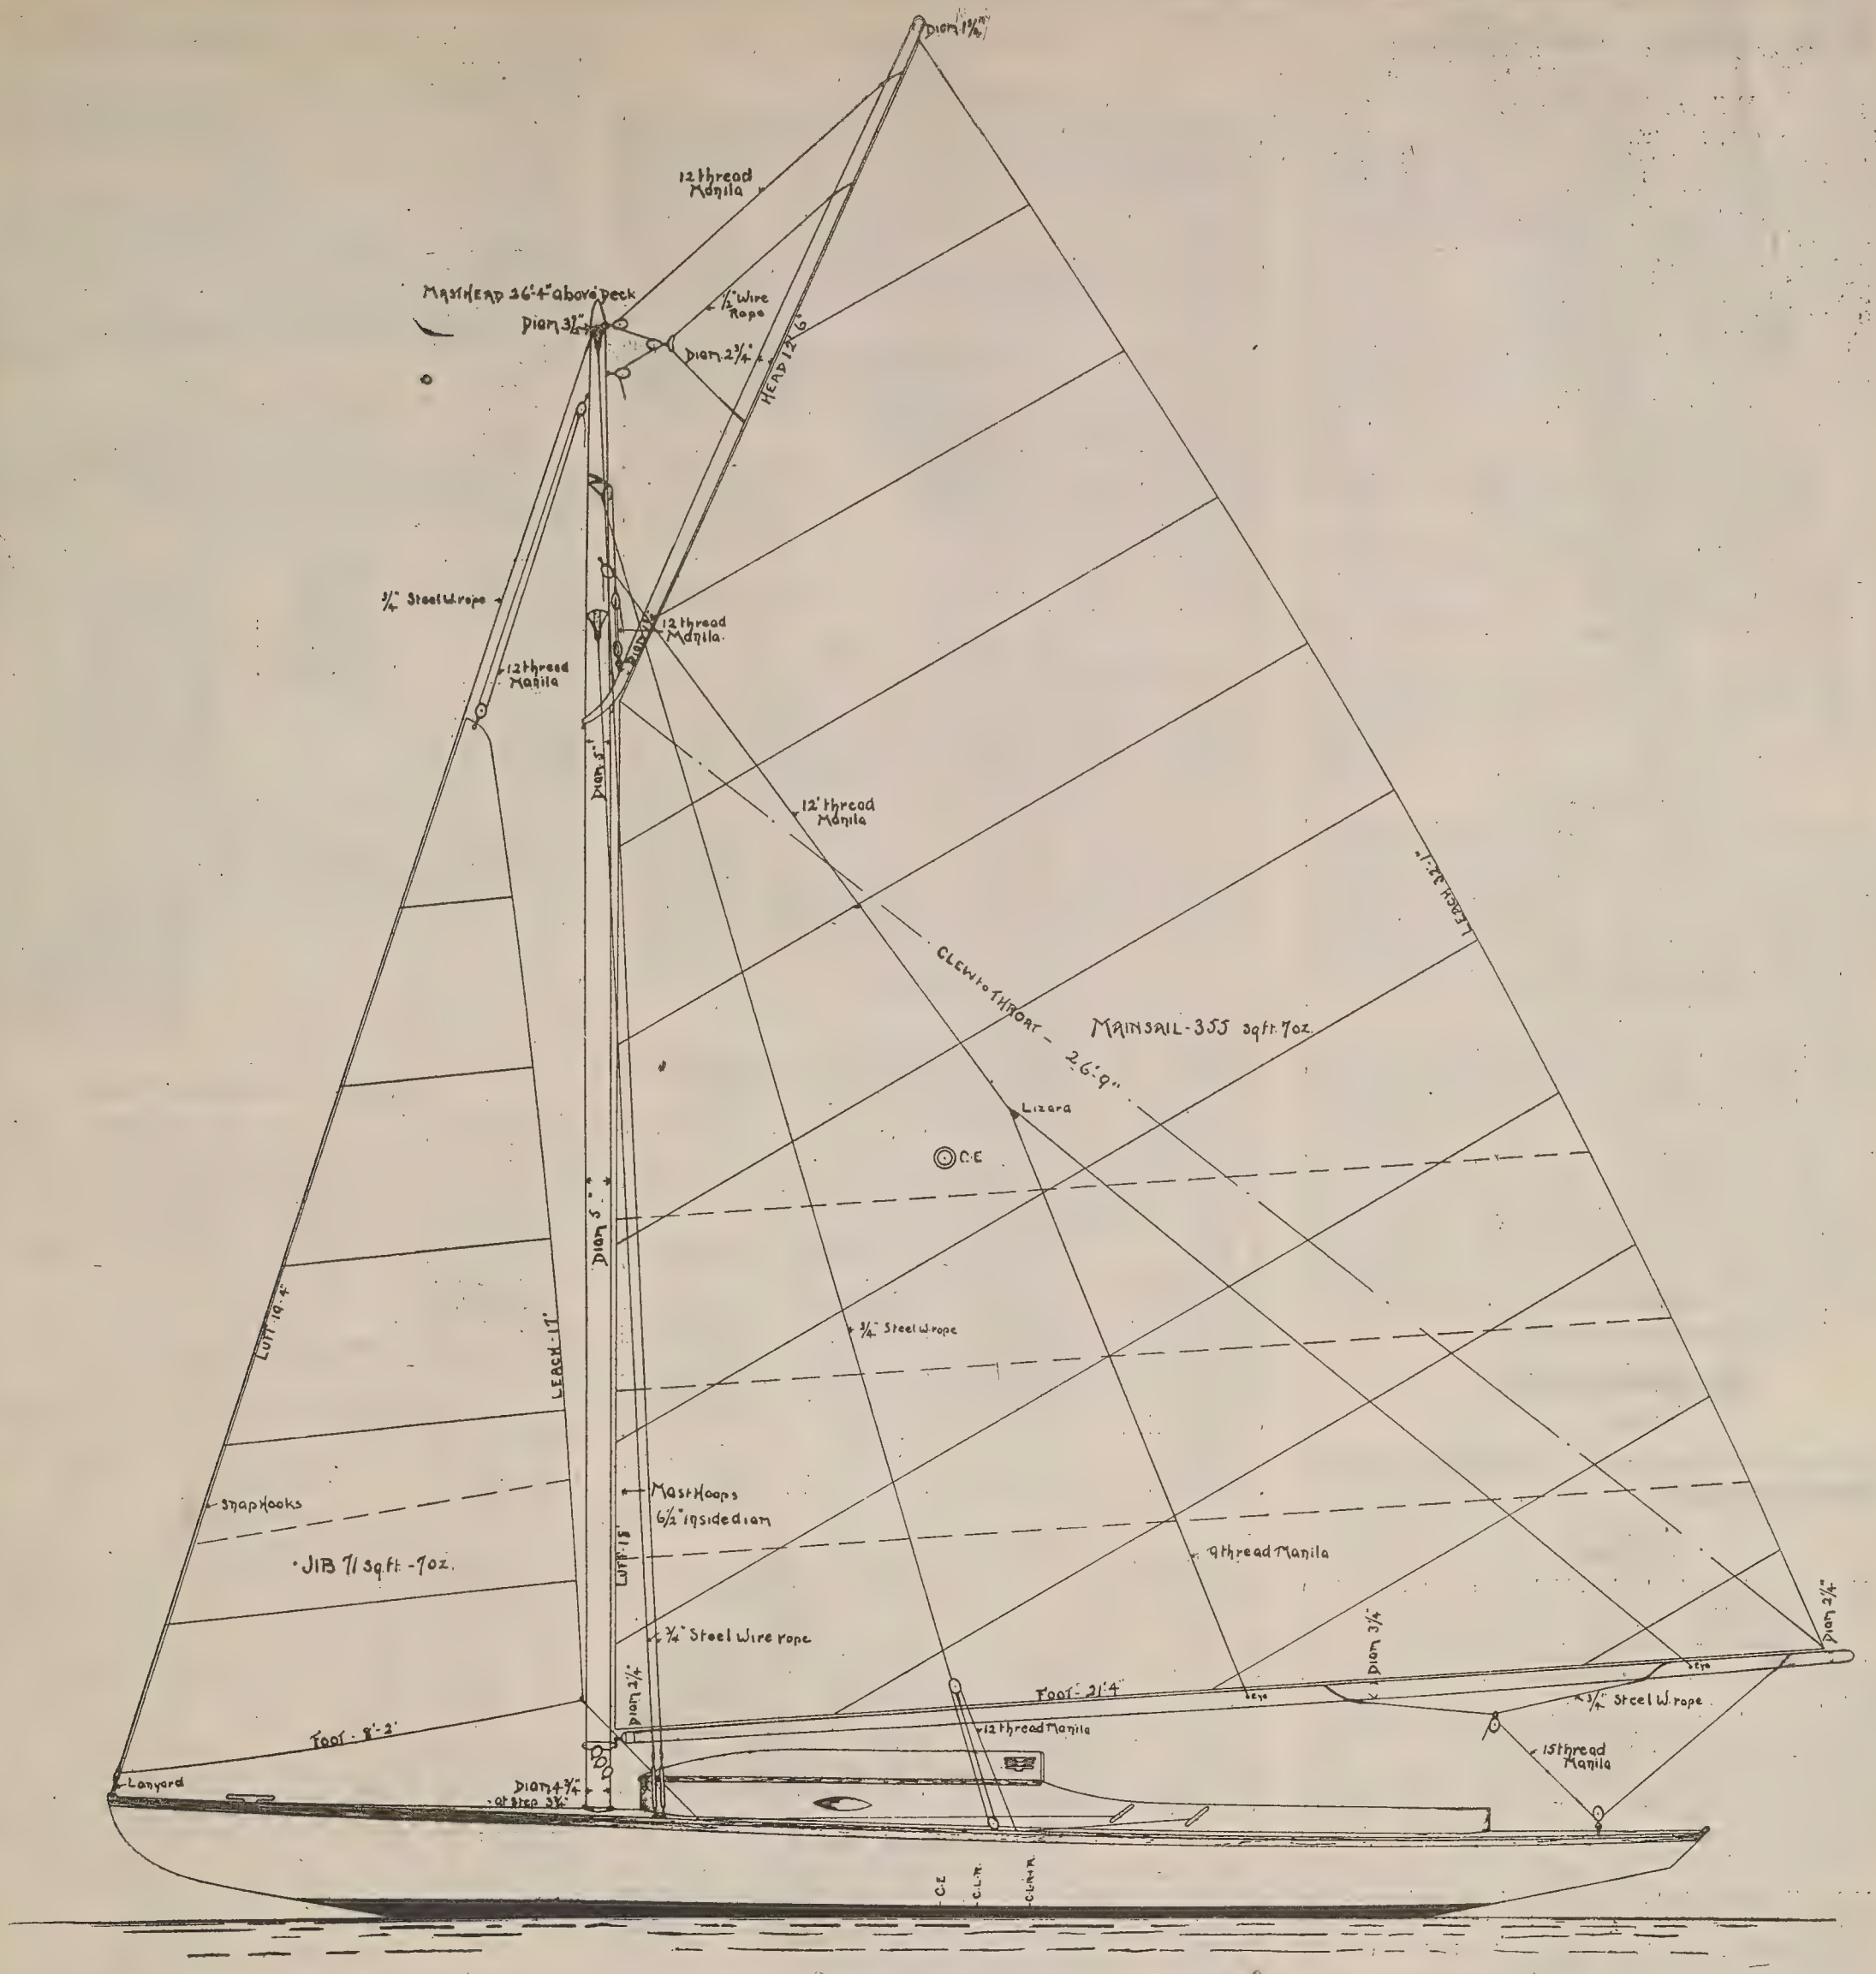
Pirate, knockabout, designed and raced by Mr. B. B. Crowninshield with much success during the season, has been sold to R. C. Robbins.

The big ship house of Piepgrass Lord, City Island, is one of the best places about New York for laying up small yachts, and many are now stored there. Most of the special 30-footers are there, with Shrimp, Dipper, Robin Hood, Walri, and a handsome little single-hand cutter built in Sweden last year. In the yard outside are Clara, Norota, Banshee, Amorita, Circe and other yachts.



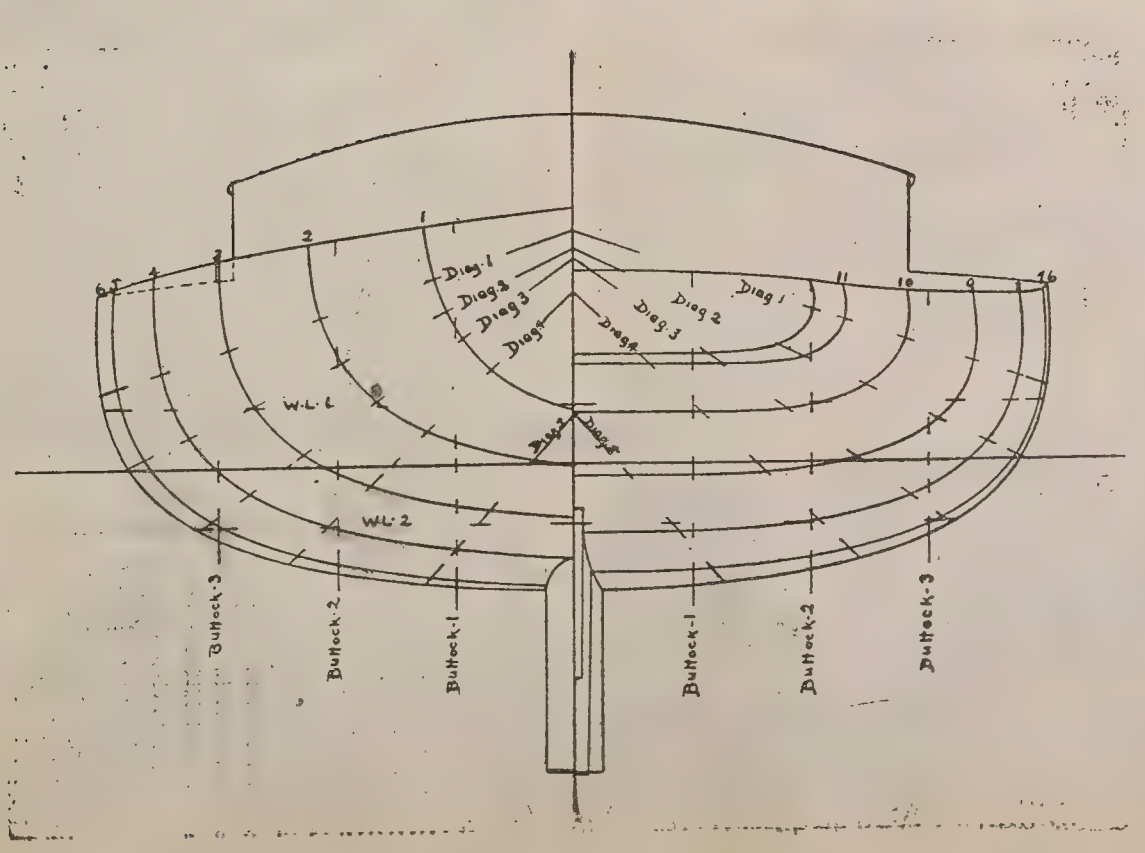
While coming up the Narrows on the way to her anchorage off Bay Ridge on Nov. 25 afternoon, the 60ft. schooner yacht Princess Anne came into collision with the steam dredge Vulcan. The bow of the heavy dredge struck the yacht on the starboard side, staving a large hole in her and severely injuring two of her crew who were in the forecastle. They were Jan Irvesen, thirty-one years old, a sailor, of 923 Atlantic avenue, Brooklyn, whose leg was broken, and Hans Hildebrand, twenty-seven years old, the cook, who lives at 192 East Fifty-first street, this city. Hildebrand's right wrist was broken and he received injuries to the spine. The yacht is owned by Harry B. Price, a broker of this city, and had been out for a sail to Sandy Hook with a party of about a dozen of Mr. Price's friends. The Vulcan was bound for Coney Island Creek in tow of the tug Matthew Warren. The crash occurred right off the Government dock at Fort Hamilton, where there is a particularly strong current at certain phases of the tide. The injured men were at once taken ashore in a small boat, and after receiving first aid from Dr. Earl H. Wayne, were sent to their homes in carriages. Princess Anne was found to be leaking badly, and was towed to Bay Ridge and placed in a dry dock there to save her from sinking. It will cost about $2,400 to repair the damages to the vessel, the value of which is estimated at $10,000.—New York Times.

Two men and a boy were hurt on the afternoon of Nov. 26 in a collision in Gravesend Bay, off Fort Hamilton, between the 50ft. sloop yacht Geraldine, owned and commanded by Edward B. Steele, of New Rochelle, and the fishing schooner Eliza B. Storer. The heavy tide carried the boats near each other, and before the accident could be avoided the Storer's bow crushed into the starboard side of the sloop. The top running gear of the latter was torn away and fell to the deck. The bowsprit of the Storer struck two of the seamen on the yacht, Hans Pabst and Frederick Keller. Keller's right wrist was broken and Pabst had a cut, 7in. long, on the top of his head besides a broken nose. Alfred Ginning, seventeen years old, mess boy on Geraldine, was in the cabin of the yacht at the time of the accident and was thrown to the floor. He received a severe contusion of the base of the spine and was partly paralyzed.—New York Sun.



Mr. Will Fife, Jr., at latest reports had by no means recovered from his illness, though much better and able to sit up each day. Shamrock will lie at moorings in the Garelock through the winter.

NOTICE.



THE New York Clearing House has adopted new regulations governing the collection of checks and drafts on banks outside of the city. This entails a collection expense on those who receive such checks. Our patrons are requested, therefore, in making their remittances to send postal or express money order, postage stamps, or check or draft on a New York city bank or other New York current funds.

Mr. Peck—By jing! I had a funny dream last night. It seemed that I was away off in South Africa, where diamonds were lying all around me in heaps. Mrs. Peck—Did you seem to see any as small as the one in the engagement ring you gave me?—Chicago News.

Rifle Range and Gallery.

Rifle at Shell Mound.

SAN FRANCISCO, Cal., Nov. 27.—Yesterday was an unusally fine day at Shell Mound; there was no wind—a rare thing on this range. Many marksmen were present. In addition to the regular events there was a public cash shoot given by the Norddeutscher Club. Conditions of contest: Tickets of 4 shots $1 each, re-entry, 200yds. High scores were: Wm. Glinderman 97 rings, D. W. McLaughlin 96, Dr. Rodgers 94, D. B. Faktor 94, A. Pape 93, F. Attinger 91, W. Garms 90, F. Koch 90.

A hot fight is being waged in the continuous contests of the Germania Club. D. B. Faktor and Dr. Rodgers are now tied for the first cash prize of $100, each having 724 rings in best ten 3-shot scores. The possible is 750 rings. The Bushnell trophy, a valuable one, is anybody's as yet. At present Dr. L. O. Rodgers is in the lead. Conditions: two 10-shot scores per month allowed; entrance $1 each score; best ten scores of the 24 to count; 25-ring target. Dr. R. has 2,212 rings, F. P. Schuster 2,207, D. B. Faktor 2,189, with McLaughlin and Utschig close up. McLaughlin has not competed regularly.

Several good scores were made by the Golden Gate Club team in their score to-day for the Outdoor Life trophy, McLaughlin and Mason each making 91 rings on the standard American target, and F. P. Schuster and Dr. Rodgers each making 90.

Scores of the Golden Gate Club:

Rifle, 25-ring target, two scores allowed: Gorman, 209, 212; F. E. Mason 216; C. M. Henderson 216, 213; O. A. Bremer 195; D. W. McLaughlin 216; G. Tammeyer 207; F. W. Belknap 202; J. F. Bridges 191, 189; E. N. Moore 195.

Pistol, standard target, 50yds.: E. N. Moore 73, C. Roberts 79, F. W. Belknap 73, C. M. Henderson 77, J. F. Bridges 74, J. E. Gorman 93.

Team match, Outdoor Life trophy, first score, for July, 1899: Capt. F. Schuster 90, Dr. L. O. Rodgers 81, J. E. Gorman 77, D. W. McLaughlin 84, F. E. Mason 85, D. B. Faktor 75; total 492.

Second score, for November—Capt. F. P. Schuster 83, Dr. L. O. Rodgers 90, J. E. Gorman 74, D. W. McLaughlin 91, F. E. Mason 91, D. B. Faktor 75; total 504. ROEEL.

Rifle at Conlin's Gallery.

PRIZE shooting for November was ended at Conlin's gallery, 513 Sixth avenue, New York, on Thanksgiving Day. First prize for rapid firing was won by George Herman, 15 shots in 11 seconds, scoring 14. He has done this in 7½ seconds in practice. A. C. Goodrich won first at rest shooting with Ballard rifle, 10 shots at 25yds., scoring 92 out of 100. Peter DeNice, at 25yds., off-hand, made 11 bulls out of 12 shots on a 2½in. bull. Dr. R. H. Sayer has made the best scores with the revolver since the gallery has been open, and W. C. Southwick has done the best work with the Stevens single-shot pistol. There will be prizes for the best rifle, pistol and revolver scores during the month of December. All are welcome.

There passed through the Barge Office yesterday a family that created some curiosity. It was that of Moises V. Ponce, a Peruvian: his wife, Francesca, and four little boys. The family arrived from Para on the Red Cross steamship Maranheuse. Ponce's home is in Iquitos, a town on the eastern slope of the Andes. He and his family wanted to go to Truxillo, on the coast of Peru, but between his home and his objective point lay the Andes. There being no railroad and the way being extremely rough on beasts of burden, Ponce decided to go by boat down the Amazon to Para, thence by steamship to New York, and thence by steamship again to Colon. After crossing the isthmus by rail, the family will board a coast steamer at Panama and continue their journey to Truxillo. The distance between Ponce's home and Truxillo is only 400 miles, but by the way he has chosen he will have traveled 9,000 miles by the time he reaches his destination.—New York Times.

Trapshooting.

If you want your shoot to be announced here send in notice like the following:

Fixtures.

Dec. 12.—Dexter Park, L. I.—Live-bird shoot of the Brooklyn Gun Club. John S. Wright, Mgr.

Dec. 12-15.—Burnside Crossing, Ill.—Watson's Park tournament. John Watson, Station R, Chicago, Ill.

Dec. 16.—Batavia, N. Y.—E C cup contest for championship at targets, between Messrs. W. R. Crosby, holder, and Fred Gilbert, challenger.

Dec. 19.—Dexter Park, Brooklyn, N. Y.—Open shoot of the Emerald Gun Club. Live birds. L. H. Schortemeier, Vice-Pres.

Dec. 31-Jan. 1.—Milwaukee, Wis.—Amateur tournament of the Wisconsin Gun Club. P. Himmelstein, Sec'y.

Brooklyn Gun Club.—Third Saturday of each month, Francotte gun contest. Fourth Saturday of each month, Grand American Handicap free-entry contest.

Watson's Park.—Burnside Crossing, Ill.—Medal contest the first and third Fridays of each month.

1900.

Jan 16.-19.—Hamilton, Ont., Can.—Annual tournament of the Hamilton Gun Club; $1,500 in prizes. Open to the world. H. Graham, Sec'y.

Jan. 17-18.—Danville, Ill.—Sconce-Cadwallader invitation shoot. Live birds and targets. John Parker, Mgr.

Feb. 13-17.—Hot Springs, Ark.—Third annual midwinter tournament; $1,000 added; 2-cent targets (Rose system) and live birds (high guns). Capt. A. R. Smith, Sec'y.

April 2.—New York Vicinity.—Interstate Association's Grand American Handicap. Edward Banks, Sec'y.

April 18-21.—Lincoln, Neb.—Third annual amateur tournament of the Lincoln Gun Club. Live birds and targets. W. S. Stein, Sec'y.

DRIVERS AND TWISTERS.

In the absence of the Editor of this department all communications intended for publication should be addressed to the Forest and Stream Publishing Co.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have printed. Ties on all events are considered as divided unless otherwise reported. Mail allsuch matter to Forest and Stream Publishing Company, 346 Broadway, New York.

The programmes for the Brooklyn Gun Club's invitation live-bird shoot are now ready for distribution. The shoot is to be held at Dexter Park, L. I., on Tuesday, Dec. 12. The programme, consisting of three events, calls for 22 birds, with a total entrance fee, including birds, of $17.50, and has been arranged so as to give satisfaction to the greatest number. Miss-and-outs will also be shot if time permits. It is the desire of the management that all shooters wishing to take part should be on hand promptly at 10:30 A. M. Lunch will be served on the grounds, and nothing will be left undone to add to the comfort of the shooters. John Wright will manage the shoot.

William McCarty, of Buffalo, N. Y., and James Sweet, of Smoke Creek, N. Y., will shoot a match at 25 live birds for $25 a side Dec. 14 on the grounds of the Bison Gun Club at Buffalo, N. Y.

ON LONG ISLAND.

Carteret Gun Club.

Garden City, L. I., Nov. 30.—The Thanksgiving Day shoot of the Carteret Gun Club was held here to-day. The weather was fine, and the birds were a good lot. The main event of the day was the Maryland cup handicap, at 20 birds, in which Capt. Money and G. S. McAlpin tied for the cup on 18. In the final shoot-off McAlpin won. In this event Harold Money made a clean score, but being a guest he was ineligible for the cup. His shooting throughout the day was excellent. Following the cup event were a miss-and-out at 30yds., a sweep at 3 pairs, 25yds., and two 5-bird sweeps. Brown and L. Duryea tied for first place in the first of the 5-bird sweeps, and Brown, Mackay and Ripley in the other. The scores:

	Maryland Cup.	Miss-and-out.	Sweep.

Money	22112—5 000—0

Hell Gate Gun Club.

Dexter Park, Nov. 28.—At the regular monthly shoot of the Hell Gate Gun Club there were no less than thirty-eight men to face the traps. The birds were a fine, strong lot, and flew well, considering there was hardly a breath of wind stirring. Of the club members, President John H. Voss, Conrad Webber and H. Foster made straight scores, notwithstanding they were standing at the 30yds. mark. John Schlicht ought to have had a clean score, as his last bird was a comparatively easy right-quarterer. The only theory to be advanced for his missing it is that there is an old custom in this club that every man making a straight score has what is known as an "apple jack" on him, which means he is supposed to call all the boys in, and there and then "throw up his hat," which is sometimes quite expensive. President Voss was inclined to fine him $1, but relented after chafing him good-naturedly. Of the guests, that crack revolver shot and promising gun shot, Dr. Ashly A. Webber, killed his 10 straight, using only one barrel on the first 8. This young man is bound to rise to the front rank of wing shots in this country ere long, he being a perfect gentleman in his actions and demeanor, quite unassuming and ever ready to do anything to oblige a fellow shooter. The scores:

Thirty yards, 7 points:

J H Voss	1121222112—10	E Doeinck	2202122122— 9

Crescent Athletic Club.

Brooklyn, N. Y., Dec. 2.—The first of the series of shoots for the December cup was held to-day on the club's grounds, at Bay Ridge. G. W. Cropsey won the event. The scores:

December cup, 25 targets per man, handicap allowance: G. W. Cropsey, 4, 24; G. Stephenson, 5, 22; A. R. Fish, 3, 22; F. B. Stephenson, 5, 22; J. H. Hallock, 3, 22; H. A. Kryn, 2, 20; G. Notman, 4, 20; W. W. Marshall, 4, 20; A. C. Wyckoff, 5, 19; H. L. Kenyon, 6, 19; E. L. Rhett, 5, 18; L. C. Hopkins, 5, 16; F. D. Mead, 8, 15; E. C. Britton, 5, 14.

Prize shoot, 15 singles and 5 pairs: G. Stephenson 24, F. Stephenson 21, J. H. Hallock 20, A. C. Wyckoff 20, G. Stephenson 18, G. W. Cropsey 18, Lowndes Rhett 18, A. R. Fish 19, Henry Kryn 16, W. W. Marshall 16, E. C. Britton 8.

Ten pairs: Kryn 16, Notman 15, F. Stephenson 13, G. Stephenson 11, Fish 8, L. O'Brien 10, L. Rhett 11, Marshall 11, Wyckoff 11.

Twenty-five targets, unknown traps, known angles: Kryn 20, F. Stephenson 19, Notman 18, G. Stephenson 18, Wyckoff 15, Marshall 15.

Sheepshead Bay Gun Club.

Sheepshead Bay, L. I., Dec. 2.—The Sheepshead Bay Gun Club's live-bird shoot was held to-day at the Cedars. Scores:

Club shoot, 7 live birds: I. McKane, 28yds., 7; H. Koch, 26yds., 6; J. J. Pillion, 29yds., 5; P. Martin, 28yds., 6; H. J. Montanus, 28yds., 6; Geo. McKane, 27yds., 6; D. J. Heffner, 26yds., 5; F. Aborn, 27yds., 4; R. Smith, 28yds., 4; C. Dwyer, 26yds., 4; J. B. Voorhies, 26yds., 4; R. Roderick, 25yds., 1; A. Seller, 26yds., 3; Wm. H. Boyle, 26yds., 3; J. Burns, 26yds., 3; H. Lundey, 26yds., 4; H. J. Tryoler, 26yds., 4; W. J. Seaton, 27yds., 2; E. Voorhies, 27yds., 2; D. Martin, 26yds., 3.

No. 1, 5 live birds: J. Burns 3, F. Lundey 1, C. Dwyer 3, G. McKane 3, D. Martin 2, H. Koch 4, F. Osborne 2, P. Martin 3, J. Cordes 2, M. Boyle 3, A. Soeller 4, W. Seaton 1, H. Tryoler 4, H. J. Montanus 3, D. Heffner 2, R. Smith 3, J. Smith 5, J. B. Voorhies 3, J. J. Pillion 4, I. McKane 3.

No. 2, 5 birds: Burns 4, Lundey 1, Dwyer 3, McKane 3, Martin 2, Koch 4.

No. 3, 5 live birds: Burns 1, Lundey 4, Dwyer 2, G. McKane 2, D. Martin 3, Koch 1.

No. 4, 5 live birds: Burns 5, Lundey 5, Dwyer 5, McKane 5, Martin 5, Koch 5.

Brooklyn Gun Club.

Brooklyn, N. Y., Nov. 30.—The holiday shoot of the Brooklyn Gun Club was held on the club's grounds to-day. The prize shoot was at 50 targets, handicap allowance, for a Stevens pistol. The scores: Dr. Webber, 3, 50; Dudley, 3, 50; Van Allen, 4, 50; Bennett, 6, 50; Amend, 3, 49; Dressel, 5, 49; Dr. Kemble, 6, 48; Schubel, 6, 46; Meeker, 9, 35.

Dec. 2.—The main event to-day was the 25-target handicap, for an electric night watch lamp, which was won by Dr. A. A. Webber after two ties had been shot off. The scores:

Lane, 6	01111111111111111011011010—20— 6—25
Adams, 6	01110100110111111111111111—20— 6—25

G. B. PATERSON, Sec'y.

Cincinnati Gun Club.

CINCINNATI, O., Nov. 30.—Herewith find scores of Thanksgiving Day shoot of the Cincinnati Gun Club. Shooting has been dull here since our tournament, but this is no doubt due to the game season. Schuler's beautiful live-bird trophy will be contested for for the first time next Wednesday, and a good entry list is looked for. Scores:

Dec. 1.—A 100-bird match for $100 a side and the price of birds was shot to-day between Nye and Werk. The weather was dark and cold, and there was a very light wind. The birds were a selected lot, strong, dark and very fast. The retrieving was done by Mr. Gambell's setter Colonel, and there is none better. Nye shoots Robertson a similar race in the near future. The score:

Philadelphia Trapshooters' League.

WISSINOMING, Pa., Nov. 30.—The Philadelphia Trapshooters' League wound up its series of contests to-day on the grounds of the Florists' Gun Club, at this place. The conditions of the individual match were 15 targets, known angles; 15 targets, unknown angles, handicap added to score. The team match conditions were three-men teams, 25 targets per man, handicap added. The score:

Individual match: Morrison 30, Longnecker 30, Ford 30, Ridge 30, Redifer 30, J. Fisher 30, Felix 30, Edwards 30, Landis 30, De Houpt 30, McFalls 30, Park 30, Franklin 30, H. Fisher 29, Puff 29, Winchester 29, O'Brien 28.

Team match:

Glen Willon Gun Club Team No. 1—McFalls 28, Cowan 29, Free 26—83.

Independent—Ridge 29, Landis 27, Longnecker 26—82.

Silver Lake Gun Club Team No. 2—McAfee 26, Reed 26, Peden 24—76.

Florists' Gun Club Team No. 1—Smith 27, Harris 23, Park 26—76.

Silver Lake Gun Club Team No. 1—O'Brien 26, Winchester 25, Edwards 21—72.

Southwark Gun Club Team No. 2—Woodstager 22, Ford 24, Fisher 25—71.

Soo Gun Club.

SIOUX CITY, Ia., Nov. 22.—The Soo Gun Club's two days' live-bird and target tournament closed to-day. The first day's weather was miserable—damp, foggy, and at times a drizzling rain fell. The birds were slow and sluggish, but hard to see on account of the dull weather, and shooting was therefore difficult. The winners on the first day were:

First event, 7 live birds: Budd, Saxton, Saunders, Bray and Glisman 7 each. Second event, 15 targets: Robertson 15. Third event, 15 targets: Gilbert 15. Fourth event, 10 live birds: Budd, Shaw, Milner, Boyd, 10 each.

The second day's weather conditions were first class. The sun remained hidden behind clouds just enough to make the light right. The birds were a good lot. The winners were:

First event, 7 live birds: Budd, Klein, Glisman, Halla, Peterson, O'Brien, Leech, 7 each. Second event, 15 targets, Peterson, 15. Third event, 15 targets: Klein, Gilbert, 14 each. Fourth event, 10 live birds: Burk, Gilbert, Milner, Gorman, 10 each. Fifth event, 15 targets: Klein, Bush, 15 each. Sixth event, 15 targets: Bray and Klein 15 each. Seventh event, 15 targets: Gilbert and Kirshner 15 each. Eighth event, 15 targets: Budd, 15. Ninth event, 15 live birds: Irwin, Milner, Gorman, 15 each.

J. A. PERKINS, Pres.

Springfield Shooting Club.

SPRINGFIELD, Mass., Dec. 1.—Since the opening of the bird season the club house of the Springfield, Mass., Shooting Club has been but little visited by members, but Thanksgiving morning the doors and windows were thrown open and a very enjoyable shoot was held, which will doubtless be followed by more special and regular meets. Most of the members who turned out on that occasion are well-known trapshooters. Among them were Messrs. Merritt, Jordan, Coats, Hatch and Eaton, of Springfield; and Dr. Egbert, of Holyoke. The events consisted of regular sweeps at singles and doubles, incomers and "flyovers," and of sharpening the teeth and appetites for turkey dinners on certain refreshments provided by generous Mr. Coats. The club intends to hold a short, snappy, open shoot Christmas morning for sweepstakes and a turkey. Neighboring sportsmen who enjoy shooting over a magautrap on exceptionally fine grounds should bear this in mind. J. H. E.

Audubon Gun Club.

BUFFALO, N. Y., Dec. 2.—The first of a series of trophy shoots to be held on the first Saturday of each month was shot to-day. It was the fourth event on the programme. There was a heavy wind, and the shooting was difficult. Scores:

Arkansas and the South.

St. Louis Doings—Sumpter-Dr. Smith.

ST. LOUIS, Mo., Nov. 29.—John J. Sumpter and Dr. J. W. Smith shot a match to-day on the St. Louis Gun Club grounds at 100 pigeons per man for $100 a side, loser to pay for the birds. The match was scheduled to begin at 2 o'clock, but it was nearly 3 before Dr. Smith put in his appearance, and it was 3:03 before the race was actually begun by Sumpter, who had won the toss. The race itself was not characterized by any classic performance on the part of the principals, and the score of 91 should have been much greater on the quality of the birds trapped. Had either man shot in the form he is capable of, it would have landed him a winner by 4 or 5 birds, for either is able to kill 95 of such birds under such favorable conditions. Both shot very raggedly at first, and as early as the 6th round Dr. Smith had a lead of 2 birds, though he was unable to maintain this long, as he speedily got in a bunch of misses, so that at 10 birds they were once more tied, and the end of the first string of 25 found Sumpter 1 in the lead, with 22 to 21. Toward the finish of this string the Doctor was badly up in the air, and that his losses were not greater was due entirely to sheer luck, for the gathering of his 19th and 21st can only be attributed to such. The 19th, a loggy incomer, was badly slobbered far back, and headed for the dead line, which it would certainly have crossed but for the crowd that was congregated there, and which caused it to turn and fly along it about 10yds, further and then drop just inside. The 21st was a wicked bird, that was knocked down with the second a long way off, but it was strong of wing.

Here again the element of luck was very much in evidence, for when an effort was made to gather it the bird got up good and strong, and though it flew more than twice the distance necessary to take it out of bounds it very obligingly took the longest route and stopped just inside, where by great caution on the part of Charley Spencer it was gathered. While three of the four misses charged to the Doctor were outgoers, only one of them was really a hard bird, his 22d. Sumpter, too, did little better. His first miss was really due to bad shooting. Both men braced up considerably in the next string and gave a good account of themselves, scoring 23, and the four birds lost were good ones. It looked like a cinch for the M.D. when Sumpter missed 3 out of his next 10, which gave the former a lead of 2 once more and but 40 more birds to shoot at. However, Sumpter managed to pull himself together at last, and proceeded to do some very excellent shooting, so that little by little he reduced his opponent's lead, and when the latter lost his head on an incomer on the 88th round he again assumed the lead. Dr. Smith should have smothered this bird, as he had done many similar ones, but when he missed it with his first he withheld his second until the bird was within 15ft. of the muzzle of his gun before he fired, so that though he hit it slightly it toppled over the dead line. Stupid as this piece of shooting was, Sumpter came very near duplicating it, for his 97th bird was similar in flight, and he lost it in much the same manner, only that it ducked his second, though this is no excuse, for the shot should have been made long before it was. Excepting for the bit of luck mentioned, the result is a proper one, and the race should have resulted in a tie, as neither could outshoot the other, though there were ample opportunities. Sumpter's best run was 36, and Dr. Smith's 27.

The weather was bright and clear, without any wind, while the birds, taken collectively, were an ordinary lot. Each of the principals scored some very brilliant kills. Dr. Smith's first barrel was very effective, and he is credited with many one-barrel kills, but his second was not nearly so reliable. Sumpter used both of his loads with about the same precision.

It was 4:45 when the match was completed, and as the sun was then nearly down and the birds were flying very poorly Sumpter did not want to shoot off the tie until the next day, while the Doctor was for deciding it at once. Finally it was agreed to decide matters the next day at 3 o'clock. However, later on the Doctor met with an accident to his eye and the decision will have to be postponed indefinitely.

There was a good deal of partisan feeling shown by the friends of the principals in the match, and in this respect it was anything but a gentleman's race.

Mr. H. C. Greisedeick acted as referee, and Mr. J. A. Corray was scorer.

The match was shot under A. S. A. rules, modified to 30yds. rise. Each of the principals shot Smith guns and Trap shells, while Dr. Smith used Hazard, and Sumpter Du Pont powder.

Arkansas Championship.

HOT SPRINGS, Ark., Nov. 30.—John T. Fletcher, of Little Rock, was the latest aspirant to championship honors, and with a bee of this nature buzzing under his Fedora he proceeded to issue his defy to C. E. DeLong, of Hot Springs, the present possessor of the jewelry which goes with the honor. Mr. DeLong notified Mr. Fletcher that if he really meant business he would have to come over to the Springs and play in his yard. So the latter, in company with the writer, journeyed hence on Thanksgiving Day—Fletcher with the avowed intention of setting the pace right from the jump for Mr. DeLong. Notwithstanding that this resolution on the part of Mr. Fletcher was a most commendable one, he failed to make good, and, though DeLong shot a very rank score for a champion, the only thing he got was turkey and good treatment, and a parting invitation to return and try it again. This, however, is highly improbable, as Mr. Fletcher has quietly told me that he believes he does not possess any championship ability, and therefore will hardly shy his castor into the ring against any one individually

The race itself is worthy of little comment, except for the very poor score made by the principals, which is largely due to a case of rattle, for in the general scramble that followed the individual contest DeLong broke 46 out of 50 and Fletcher 43, so that it is plainly evident that each was over-anxious, and as a consequence too slow and too cautious.

Dr. S. P. Collings was referee; L. K. Epperly, of Wallace, Id., was judge for DeLong, and the writer acted in a like capacity for Fletcher. Mr. Moyston, of Hot Springs, was scorer.

Match between C. E. DeLong, of Hot Springs, holder, and John T. Fletcher, of Little Rock, for the individual championship of Arkansas. 50 single targets, unknown angles, challenger to put up $10 against the medal, winner to take money and medal, loser to pay for the birds, Interstate rules:

Resurrected.

The most important step taken by the sportsmen of Hot Springs in preparing for their big midwinter tournament next February is the reorganization of the local gun club. At a meeting recently held for this purpose twenty-four sportsmen responded to the call, so that the club, which has been practically dead for the past four years, has once more become active. The officers chosen to serve for the ensuing year are: Dr. A. U. Williams, President; C. N. Rix, Treasurer, and C. E. DeLong Secretary. All the members are very enthusiastic over the proposed tournament, and I am assured that the added money will be raised to $1,500, which, of course, will insure a large attendance.

Scheduled.

Mr. Harvey Sconce, of Sidell, Ill., informs me that it is his intention to hold a three days' tournament at Danville, Ill., Jan. 17 to 19. The first day targets and the remaining two days live birds. Evidently he desires to conduct this on approved lines, for he writes me that Rose system and high gun divisions will prevail there.

Interfered.

Lieut. Phillips writes me from Porto Rico that the organization of the gun club among the army officers stationed at San Juan was materially interfered with by the devastating tornado that swept over the island some time ago, as the troops were scattered all over the island on relief duty, feeding the destitute, but are now beginning to return, so that ere long the Boriquen Gun Club, as he has seen fit to term it, will soon take life by holding regular shoots, of which he promises that the scores will be forthcoming.

Omaha-Kansas City Banquet.

As a finale to the intercity team contest, the Kansas City sportsmen entertained the Omaha team, their friends and the visiting sportsmen at a banquet Saturday night at Herman's restaurant. This affair, like everything else that the Kansas City sportsmen undertake, was a most lavish one. The menu consisted of thirteen courses, and comprised nearly everything that would tickle the palate of the epicure, a good portion of liquid refreshment being a part of this. There was the wine that is red and the wine that fizzes, and several other varieties so conducive to what the German terms "katzenjammer." Game was also a conspicuous feature of this bill of fare, such as black bass, teal duck, quail on toast and buffalo hump salad.

The hall was draped in the national colors, and the Stars and Stripes were very much in evidence, while interspersed along the tables were flowers, such as roses, pinks and chrysanthemums in lavish profusion, all of which added caste to the occasion.

In the absence of Mr. Walden, Mr. Sweeny acted as toastmaster, and during the evening Messrs. Brucker, Binder, Hallowell, Parmelee and Reid were called upon, and all of them responded in a very interesting and entertaining manner.

Mr. Herman, who is equal to all such occasions, had a trio of musicians present, who discoursed both vocal and instrumental music. Much credit is due Mr. Herman for the manner in which the banquet was conducted.

Mr. Brucker, on behalf of the Omaha team, thanked the Kansas City sportsmen for the generous hospitality accorded them, and assured them that when they came to Omaha in January everything within their power would be done to reciprocate in kind. It was agreed that the Kansas City team would return the visit between Jan. 15 and 20, after which the gathering dispersed.

Busch Medal.

ST. LOUIS, Mo., Nov. 28.—W. S. Thompson and John J. Sumpter shot a race for the Busch trophy at Dupont Park to-day on the best lot of pigeons that were ever trapped on the grounds. All of these birds had been trapped one or more times, and their past experience evidently lent vigor to their motive power. It was generally conceded prior to the race that Thompson stood but little chance of defeating Sumpter, and on such birds he was simply outclassed. Early in the match he did fairly well, but near the close he lost all control, and actually lost his last six birds, which put him out with the meager score of 14. In the meantime Sumpter was negotiating his birds with his customary regularity, and naturally ran away from his opponent, scoring 23. Both of his misses occurred on extremely hard drivers, and are therefore in a large measure excusable.

Sam Thompson was referee and the writer acted as scorer. This race was shot in the remarkably fast time of 21 minutes, which of itself goes to attest the activity of the birds.

These matches are shot on a handicap basis, the shooter starting in at a given mark and going back after each string of 5 birds, providing he kills straight. Thus Thompson shot all his birds from the 26yd. mark, and Sumpter started in at 29yds., so that his last 15 were shot at 31yds. When a contestant has once gone back he can never come forward again. The weather conditions were perfect. The scores:

Dr. Smith—Arnold.

On the same day at the St. Louis Gun Club grounds Dr. Smith and Arnold shot a 50-bird race for a hat and the price of the birds. This race was shot principally to try Dr. Smith out for his contest with Sumpter on the following day. In many respects this was similar to the Sumpter-Thompson match, for the Doctor was in superb form, while Arnold shot in very ragged fashion, and his numerous dead out of bounds is chiefly attributable to slovenly work, he being unable to lead his birds properly, and of course was not centering them. However, he was shooting a new load, with which he had not become familiar.

The birds were not so good as those shot on the neighboring grounds, as there were many sitters, and few that flew promptly, which was largely due to their having been fed recently. There were some really fast ones, and the Doctor scored some brilliant kills. He was using his first with great precision, so that his second was rarely required. Scores:

PAUL R. LITZKE.

IN NEW JERSEY.

East Side's Thanksgiving.

Newark, N. J., Nov. 30.—The East Side Gun Club held its Thanksgiving Day shoot on Smith Brothers' grounds, Foundry street, to-day. The weather was fair, and there was a light wind. The birds were an excellent lot, quite the best trapped here for some time. The programme consisted of a 10-bird event, $5 entrance, 29yds. rise, three moneys; a 15-bird sweep, $8 entrance, 29yds., four moneys, and several miss-and-outs at 28, 29 and 30yds. The scores:

Walsrode Gun Club.

Trenton, N. J., Nov. 30.—The Walsrode Gun Club's Thanksgiving Day shoot was a most successful affair. A large crowd of shooters attended, and shooting was continued until darkness set in. The last event was shot almost in darkness, and the rest of the events scheduled could not be shot for this reason. The scores:

Elliott-Doty for the Republic Cup.

Dec. 2.—On Thomas Morfey's grounds at Lyndhurst, N. J., J. A. R. Elliott, holder, to-day defeated Aaron Doty, challenger, in a match at 100 live birds for $100 a side and the possession of the Republic cup, by a score of 91 to 81. The weather was clear and bright, but there was little or no wind to help the birds along, consequently they were not the fast, nerve-testing kind usually dished up by Morfey, although they were not dufters by any means. Neither man's work was up to the form displayed in his recent shooting. In ten matches this season previous to to-day's Elliott has scored 964 out of 1,000 birds, a percentage of .964. To-day's score brings his percentage down to .959, a fine one at that, but appreciably below that of his previous matches. Doty's shooting to-day was quite in contrast to that in his last match on these grounds on July 14, when in a race with Harold Money he scored 95 out of 100 on some of the best birds ever trapped on Morfey's grounds. He has shown some fine work lately, and to-day's score does not do him justice. Doubtless the fact that he was up against one of the country's best and steadiest pigeon shots may have had some effect. The styles of the men were entirely different. Elliott was quick, snappy, confident; Doty slow, deliberate, nervous. Elliott was at the score almost before his opponent was seated. He glanced hastily down the barrel of his gun, swung it to his shoulder, and called, "Are you ready?" and immediately upon the puller's "Ready," he called "Pull." Doty was slow to advance to the score, carefully poised himself at the mark, raised his gun to his shoulder several times and called "Ready?" Upon the puller's reply, he swung his gun from left to right and from right to left a number of times before calling "Pull." His time became slower as the match progressed, and as Doty's grew slower Elliott's became proportionately faster. Doty had a little the worse luck in drawing his birds, but Elliott's advantage in this respect was not great. Doty twice claimed "no bird," on his 30th and again on his 43d bird.

The ball was used twice during the match—on Doty's 59th and 83d birds. Elliott's best kills were on his 25th, 36th, 39th, 61st, 72d and 74th birds. His kills of his 36th, 39th, and 72d birds were especially good, the first two being long kills with the second shell on right-quarterers from No. 5 trap that died near the fence, and his 72d, a fast, low outgoer, also from No. 5 trap.

Doty's best work was on his 11th, 16th, 19th, 26th, 49th, 50th, 53d and 73d birds. He made several good long second-barrel kills.

The quality of the birds improved as the race progressed. The second 50 were considerably better than the first 50, and toward the close some real good ones were trapped. Doty's 76th, 84th, 85th and 86th all lost feathers before getting away, and Elliott's 88th carried both charges away with it.

The time of the match was 1 hour 58 minutes. Doty was handled by his brother, John Doty. Elliott shot his match without coaching. Lewis Harrison, of Minneapolis, was referee, Jacob Pentz scorer, and Mark May pulled the traps. Tom Morfey's setter pup King did the retrieving.

Elliott shot a Winchester repeater and 45grs. of Blue Ribbon in Leader factory-loaded shells. Doty used a Westley Richards. 3½drs. of E C in the first and 3¾drs. in the second barrel, and 1¼oz. No. 7 shot in U. M. C. Trap factory-loaded shells.

Haverhill Gun Club.

HAVERHILL, Mass., Nov. 30.—The Haverhill Gun Club held their regular holiday shoot to-day, and while many of our own members were gunning in the woods we were not forgotten by our friends from out of town, Amesburg being represented by Messrs. Spofford, Lockwood, Lovering and Follansbee; Newport by Mr. Weston; Dedham by Mr. Cole; Brockton by Secretary Barrett, and the Boston Gun Club by Miss Margaret Kirkwood, her brothers William and Horace, and Sister Jennie, who claimed that the family must afford at least one spectator. Miskay was in just the right humor for smashing things, and did it with a vengeance, her shooting being simply phenomenal, scoring 130 breaks out of 140 shot at, or .928 per cent. The day was very dark, and the light poor, which in addition to the hard background makes her score all the more remarkable. Our old standby, Lambert, who recently went broke at a live-bird shoot in St. Louis, and was obliged to leave his gun with his "uncle" or count the ties home, not to be outdone by Miskay, broke 95 out of 100, using six different guns to do the trick.

S. G. MILLER, Sec'y pro tem.

Bison Gun Club.

BUFFALO, N. Y., Nov. 30.—To-day's shoot was the fourth annual Thanksgiving Day tournament of the Bison Gun Club. A number of out-of-town shooters were present, among whom were: W. R Crosby, O'Fallon, Ill.; J. S. Fanning, San Francisco, Cal.; Thomas Donley, H. H. Bates, C. Cofcey, and Robt. Emslie, St. Thomas, Ont., Can.; F. D. Kelsey, East Aurora, N. Y.; L. V. Beyer, Rochester, N. Y.; Geo. Borst, Rochester, N. Y.; Geo. Mosher, Syracuse, N. Y.; H. D. Kirkwood, Fredonia, N. Y., and J. Sweet, Smoke Creek, N. Y. The tournament was a great success. The first event was for a sterling silver loving cup, donated by the Bison Gun Club, and was won by T. G. Wheeler with 24 kills. He used Hazard Blue Ribbon in U. M. C. factory shells. The conditions were: 25 live birds, $10 entrance, five high guns. Following this were a miss-and-out at live birds, $2 entrance, and three 20-target events. Scores:

Florists' Gun Club.

WISSINOMING, Pa., Nov. 28.—To-day's shoot of the Florists' Gun Club was the first of the new series, and sixteen men took part in the shooting. The conditions were 25 targets, reversed angles; 15 targets, unknown angles, and 5 pairs; handicap allowance. The weather was clear and sharp, and favorable for shooting. Points were scored as follows: Parsons 3, Barrett 3, Cartledge 3, Bell 3, Burton 3, Park 3, Smith 2, Anderson 1. Scores:

Parsons, 14	11110110011111111010111101	—19

WESTERN TRAPS.

Thanksgiving at Watson's.

CHICAGO, Ill., Dec. 2.—A few of the faithful gathered at Watson's Park on Thanksgiving Day and indulged in what is the nearest approach in the city to a turkey shoot, namely, a shoot at live pigeons. The birds were strong and prompt and the conditions good. No regular club shoot was on, and no match of interest, the sport being in practice, of which the scores follow:

Wilson	220021222221*0*0*01011202—	15
Williams	0*2002200120001100010100O—	9
Anderson	0202002002010010000000102—	8
Johnson	0200020000010*10012201001—	8
Creyk	011021120101*1*12020	—12
R B Mack	10011102220000012022	—11

F Carson	1221*10202	— 7
Mrs Carson	0012012100	— 5
Lovell	0101212*220221*211*1	—14
Cornwall	200001*11200*1012122	—11

Chicago Sportsmen's Trophy.

Only eleven men came yesterday to take part in the sixth regular contest for the Chicago sportsmen's trophy. The weather was fine, with a brisk wind blowing to the left quarter from the score, and the birds were very good indeed, for that the moulting season is now past and the strong-flying times at hand. No one was able to land straight without his allowance, and White's run of 12 gave him high average. Clempson, winner of the last shoot, fell into the 13 hole to-day. The badge was won by Eaton, White taking the second prize, for high average. Barto won the tie on 14, killing 3 straight, Odell missing his last tie bird. Clempson took the 13 tie and Leffingwell won in the 12s. Following the main event a little miss-and-out sweep was shot, and won by Barto, who killed 9, White missing his 9th. Following are the scores:

Clempson, 30, 9	202222222*22222	—13
W B Leffingwell, 30,	0122222221211**0	—12
H Odell, 28, 3	10*122202102222221	—14
Edw Sturtevant, 30, 1	220202220212*00w	
Eaton, 28, 3	11111112121012011	—15
S Palmer, 30, 1	2220211220022022	—12
Geo Roll, 30, 0	102221120202211	—12
Dr Shaw, 30, 9	*2222201220w	
J L White, 30, 2	22222222222222222	—15
S E Young, 30, 3	1*1100200111200w	
J B Barto, 30, 1	21222*221222122*	—14

Ties on 15:

White	2222*—4	Eaton	21122—5

Miss-and-out, entrance $2:

Karnne	2222220	Barto	221211112
Palmer	10	Eaton	2221110
White	121221220	W B Leffingwell	22220
Roll	210		
Karnne	222222	Palmer	20
White	110	Barto	211220

Eureka Live-Bird Shoot.

Eureka Gun Club opened its live-bird season at Watson's to-day and made a very strong showing with sixteen members at the score. This augurs well for the interest in these events during the winter months, and it is to be hoped that the numbers will hold up. The day was a very satisfactory one in all ways—pleasantly warm, though overcast, with a right-quartering wind—and birds were far above merely good ones. The flying season is in evidence, and the sport this afternoon was real pigeon shooting. With the short race of 10 birds—and a handicap at that—no one ran straight, and the 9s had to shoot to decide a first, Parker finally winning in the tie with 9 straight kills. Ties on 8 divided, as also with 7s. Mr. Adams, the club president, and Dr. Carson, the secretary, were tied on high run, and shot to settle it, Dr. Carson winning and taking place for highest number of consecutive kills. The Eureka season prizes, for first and second places, are now on exhibition at Von Lengerke & Antoine's store. They consist of a very elegant display of cut-glass, two handsome decanters and two sets of cut-glass goblets, as good as could be purchased in the market, and they certainly are very tempting and we shall watch the club scores this winter with interest. Following is the record of to-day:

L Goodrich, 30	0222222220— 8	C C Parker, 30	1101212222— 9
R B Mack, 28	2222120000— 6	J L Jones, 28	0121011111— 8
J G Lovell, 27	1202111002— 7	E M Steck, 30	0222211112— 9
W H Cornwell, 27	10021210*2— 6	L C Willard, 30	1012121212— 9
F H Mitchell, 28	02222202*2— 7	A Sundermeier, 28	1202122111— 9
A W Adams, 30	1221221102— 9	C Antoine, 30	2112002111— 8
Dr Carson, 30	112122210*— 8	Dr Turck, 28	0112101020— 6
Mrs Carson, 26	1210001210— 6	B E Veatch, 28	20100122*2— 6

Ties on 9:

Adams, 30	0	Willard, 30	2222120
Parker, 30	122221212	Sundermeier, 28	11220
Steck, 30	212221110		

John Watson's Live-Bird Shoot.

Your Uncle, John Watson, has been waiting till his pigeon poultry was good and ripe before pulling off his big annual live-bird shoot. Having trained all the birds so that they fully know their business, he now announces himself ready to have fun with the boys, and asks them all to be on hand. The tournament begins at 10 A. M., Tuesday, Dec. 12, and it will be something which no live-bird shooter ought to miss. For each day, Tuesday, Wednesday and Thursday, the programme will be as below:

Event No. 1, 7 live birds, entrance $5; high guns. Event No. 2, 10 live birds, entrance $7; two moneys, 60 and 40 per cent. Event No. 3, 15 live birds, entrance $10; three moneys, 45, 35, 20. Miss-and-out and additional sweeps, time permitting.

On Friday, Dec. 15, the entire day will be devoted to the capital event of the tournament, the Watson live-bird handicap, at 25 birds, $15, four moneys; class shooting; handicap 26 to 31yds.; $100 added money. This will be about the biggest live-bird contest we have had here for some days, and will be awaited with interest, as it should bring out some of the good ones. Mr. Watson can run a pigeon shoot as no other man can, and this tournament will be one of the first-rankers.

Elgin National.

Elgin National Gun Club, of Elgin, Ill., has a nice little live-bird shoot on for to-day, which ought to be a very pleasant thing to take in, as the birds, the grounds and the company are sure to be good.

Elgin National Club holds a target and live-bird shoot on Dec. 31 and Jan. 1, and this is an event which the travelers ought to paste in their hats.

E. HOUGH.

480 CAXTON BUILDING, Chicago, Ill.

Garfield Gun Club.

CHICAGO, Dec. 1.—The following scores were made on the grounds of the Garfield Gun Club yesterday (Thanksgiving). The birds were in the main a fast lot, although a nasty north wind blowing across the traps seemed to chill both shooters and birds, making the birds a little slow about taking wing, but screamers when once started. The retrieving was done by Mr. Kuss' dogs in their usual dashing style. Several visitors attended the shoot, and all seemed to enjoy themselves:

DR. J. W. MEEK, Sec'y.

Trap Around Reading.

READING, Pa., Nov. 30.—The annual holiday shoot of the South End Gun Club, of this city, was held to-day on the club's fine shooting grounds, near the city line. In the medal shoot, 25 targets per man, Yost and Eshelman tied on 21 in Class A, and in the shoot-off Yost won by the score of 24 to 23. In Class B Gicker broke 20 and won the silver medal, while Wilson broke 7 and won Class C medal.

The official scores in the medal shoot follow:

Yost	11111011110111101110111011111—21
Matz	11111111011101111011101110—20

DUSTER.

Minneapolis Gun Club.

MINNEAPOLIS, Minn., Nov. 30.—Thirty shooters attended the Thanksgiving Day shoot of the Minneapolis Gun Club, and, all things considered, some good sport was had, though the day was dark and gloomy and most of the time a drizzling rain was falling. The wind blew across the traps just strong enough to make the birds, which as a whole were a good lot, strong flyers. All shooters stood at 28yds., and some excellent scores were made. G. Norenberg scored 10 straight, killing all his birds with the first barrel. Several other straight scores were made in the different events. Mrs. Johnston, the only lady who shot, scored 17 and 2 dead out of bounds in a possible 20, which is a good score, considering that she shot 3½drs. of powder in a 6¼lb. gun, which handicaps her very much in the use of the second barrel, as the load is a little strong for that weight of gun. Four new members were elected. The grounds will be open on Thursday afternoons at 1 o'clock until further notice, weather permitting. Arrangements are being made for an all-day sweep shoot on Christmas Day, notice of which will be published later. The following are the scores in the different events:

French	2221121222—10	.....	.....	.....	.....	.....

PUBLISHERS' DEPARTMENT.

Messrs. G. W. Cole Co., well known as manufacturers of Three-in-One, have just issued a new catalogue of their lubricants and bicycle specialties. Their catalogue contains a great deal of interesting matter, and will be sent free on application.—*Adv.*

The new model 1900 Spencer Repeating Shot Gun, advertised in another column, is a take-down, and in every respect thoroughly up to the times. One of its features is the strong double extractor which throws the cartridge off to the right; another is an improvement in the magazine, and another still a simplification of the take-down apparatus. The grades of the Spencer are the same as heretofore, and all are now made take-downs.—*Adv.*

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1899, BY FOREST AND STREAM PUBLISHING CO.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, SATURDAY, DECEMBER 16, 1899.

VOL. LIII.—No. 25. No. 346 BROADWAY, NEW YORK

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, $4 per year, $2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iv.

WIND FARMS.

WE have frequent occasion to refer to the highly unnatural history of the daily papers which often imposes on that large section of the reading public which knows nothing about natural history but is credulous enough to believe everything it sees in print.

There recently appeared in the New York Sun a half-column letter, perhaps from Mulberryville, Ia., which purported to give an account of various farms in that State which were devoted to raising wild animals for commercial purposes. Among these were named tracts on which leeches, frogs, rattlesnakes, coyotes, skunks, rabbits and many other creatures were bred and raised to sell. According to this veracious letter, the rabbit farmer had this season sold 1,000,000 rabbits, and had enough breeders left to rear twice as many next year. The leech farmer was growing rich at a rate of great rapidity, and so were all the other men interested in the vermin farms. It is a fact worth noting that the people told of in these accounts never fail. They are always successful, and in the end become disgustingly rich.

The Springfield Republican printed a sarcastic comment the other day on the misinformation appearing in the daily press about the Indians. It said:

> Yellow journalism sent afloat the other day a statement that the Sac and Fox Indians were on the warpath in Ohio, and were going to lay waste Toledo. The last enrollment of the tribe shows a total of 390. Of this number 101 males are over eighteen years of age; of this number forty are willing to submit to and fall in with the plan of education and improvement as outlined and provided for by the general government. Of the remaining sixty-one, about twelve are old men, three of them being entirely blind.

To this it might be added that as with the snakes in Ireland there are no Sacs and Foxes in Ohio.

Similar absurdities appear constantly in the daily papers, but life is far too short to be spent in going about correcting the blunders made by careless writers or intentional fakirs on subjects about which the essential facts are perfectly well known.

Let us go back to Mulberryville. The correspondent omitted to mention one industry that thrives near this future metropolis, namely, the pursuit of raising wind to sell to the daily papers. This vocation appears to be successfuly practiced by at least one individual there, who from time to time ships off to the newspapers a portion of the product of his farm, for which he perhaps receives cash, thus raising the wind in a double sense. In these days wind has a money value, and there are those who no longer say contemptuously, with the patriarch of old, "Shall a man fill his belly with the east wind?" but are only too glad to take the wind from whatever quarter it may come, if by a simple process of assimilation they can turn it into the "long green."

The fact that the wind farms flourish in many places all over the land, and that they find an unfailing market for their product, is an interesting sign of the times, and of the growing tendency of the present day in writing, a tendency that is seen wherever type is used to convey ideas—in newspapers, in magazines and in books. People are no longer content to have things told them simply as they occur. They want the adjectives piled on and the writing made fine; they want to be wrought up to the highest pitch; they want pepper in what they read to-day, even if to-morrow they must be told that the dish was really not even salted.

And since people want this and are willing to pay their money for it, it is not surprising that authors and publishers make haste to supply it.

An interesting example of the writing of to-day is seen in the accounts given in the London papers of the fighting at Modder River in South Africa. All accounts agree that on one side there were 6,000 or 7,000 soldiers, on the other 10,000, and that the battle lasted fourteen hours, and was hotly contested. The English newspapers speak also of the accurate marksmanship of the Boers, tell of "the perfect hail of bullets," the "harvest of death," and how, if a man showed his head from behind his cover death was certain. At times the English troops came out from behind cover and rushed toward the enemy, and when they did that they "fell by hundreds." This sort of thing was going for fourteen hours, be it remembered, and the distance between the forces was, most of the time, less than 600 yards, and the British were then exposed on a flat plain, where there was no cover; and yet the total number of men killed on the British side is given by the newspapers as 128. And this is what—to quote the newspapers again—is "the bloodiest battle of the century."

The good old days when the wise man already quoted said, "My desire is that mine adversary had written a book," and when most of the other wise men agreed with him, are past, and now one's nearest and dearest wish him to write and to keep on writing.

This is a period of "literature" run mad, of the manufacture of books in immense numbers and great quantities. These books are made to sell, and the struggle to make them salable and successful is severe and continuous. Each author and each publisher strives constantly more and more to make his product more attractive than that of each other author and publisher. The result is a continual striving after something that shall astonish the public or that shall move it by playing upon its emotions, and the more sensational the work, the louder the praise sung by the writer's admirers.

What the effect on the public mind of this flood of literature—some of it vicious and much of it worthless—remains to be seen.

"HAVE THE DUCKS CHANGED THEIR FLIGHT?"

IN another column is printed an inquiry frequently propounded by sportsmen with regard to migratory birds. We have all heard it asked about ducks, woodcock, snipe and rail, and when it is asked it usually means no more than that in some locality where formerly they were plenty the birds now appear scarce. We are all very much disposed to endeavor to find or assign a plausible explanation for the growing scarcity of game birds, but we seem very unwilling to acknowledge the most self-evident and greatest cause of all, which is over-shooting.

If we look back in the old books of fifty years ago on ornithology or sport, or even to the early numbers of the older journals, we find that in those days birds were enormously abundant. Men had been killing them for a hundred years or more, but great stretches of uninhabited territory were still their undisturbed breeding ground, the number of men who gunned was not very great, and their weapons were of a type which to-day would be called primitive. Now, the breechloader with its smokeless powder has taken the place of the muzzleloader, railroads carry the gunner wherever he wishes to go, the great breeding grounds of the Northwest have been invaded by settlers, and—more important than all—a hundred men are interested in shooting to-day for one that carried a gun thirty years ago.

All this means that the world is growing too small for the wild creatures that used to inhabit it. Civilized man penetrates everywhere, and where civilized man goes, and goes regularly, the wild birds or animals cannot exist.

Without at all going into the merits of the question asked by our correspondent, it appears to us that the weather which has prevailed up to the date of his letter is ample explanation of the scarcity of ducks on the Virginia shore. Until after Dec. 1 the weather along the north Atlantic coast has been more like that of September than of November, and there has been no reason for the birds to visit their feeding grounds in the South. Along much of the New England coast and on Long Island Sound fowl are still very abundant, and it is not likely that there will be much improvement toward the south until frost shall seal up the more northern feeding grounds, and thus oblige the birds to continue their migration.

We believe that the ducks are each year fewer in numbers than they were the year before, and this for the very good reason that more birds are killed during the months that the fowl are in the United States than are reared each summer. The birds are growing scarcer and will continue to do so, year by year, until some measures are taken to protect them during their southern flight by greatly reducing the number that are killed. One of the most obvious of these measures would be to abolish absolutely and everywhere spring shooting; another would be to limit the number of birds to be taken in a day or in a season by any one individual. Ultimately the matter will force itself on the attention of gunners, and will demand a remedy, and until public opinion shall act, there is no prospect of improved wildfowl shooting.

ANTLER.

WE record with sincere regret the passing away of our contributor whose pen name of Antler has so long been familiar to the readers of FOREST AND STREAM. Mr. Stratton died at his home in Grand View, Tenn., on Nov. 30. The period of his life spans a notable stage in the development of the country and the changed conditions of living. Born in Massachusetts in 1812, he was of the sturdy stock of a generation that literally hewed its way into the wilderness and won the land for settlement. When he was four years old the family removed to Cattaraugus county, N. Y., where the nearest neighbor was eight miles away. The boy was brought up amid surroundings that went to develop a native taste for the woods and the hunt. His was a love of nature which abided with him through life. He passed months alone in the solitudes of the mighty forests. "In the early days of his manhood," writes one of him, "he was known far and wide as 'Leather Stocking,' which perhaps tells the whole story of Antler as a hunter." His contributions to these columns were largely reminiscent of the early days; and in his personal correspondence he revealed the simplicity and ingenuousness of character which endeared him to his friends. His was a nature which had in it the purity and freshness of the mountain surroundings he chose for the home of his declining years.

SNAP SHOTS.

Mr. Henry Stewart sends us an intelligently written description of the Southern mountain district which it is proposed shall be converted into a national forest preserve. At a convention held in Asheville, the other day, of those interested in the preserve project, a permanent organization was effected under the name of the Southern National Park Association, and a systematic campaign will be conducted to create a public interest which shall result in action by Congress. As the speakers at the meeting well said, if we have established or are to establish national parks in the West, like considerations call for setting apart forest reserves in the East. The special natural advantages of the region under consideration are such as to mark it for a public reservation; the plan should receive the cordial support of the country, because it is of national concern and benefit.

On Thursday of this week the centenary of the death of George Washington (Dec. 14, 1799) was observed in various ways; and the occasion prompted to a consideration of one phase and another of his character by press, platform and pulpit. The sketch of Lord Fairfax, the father of fox hunting in America, presents the youthful Washington as a sportsman. The love of the chase which is here so well pictured by Mr. Hagan remained with Washington all his life, and he was the first of a line of Presidents who found in some branch of field sports the diversion and recreation which not only showed them to be well-rounded men, but, we cannot doubt, greatly enhanced the value of their public services.

The North Carolina quail netter is an industrious and enterprising fellow, and the effect of his work is found in such scarcity of birds as is reported by a correspondent writing from Catfish in that State. And by one of the inconsistencies of human nature, it happens that the North Carolina illicit quail netter is aided, abetted, encouraged and rewarded by the Northern sportsmen—individuals and clubs—who buy the live birds for stocking purposes.

The authorities have undertaken the prosecution of the Meadow Brook Hunt Club deer chasers who ran a deer with hounds on Thanksgiving day. The case should so be settled that no repetition of the hunt will be attempted by the present generation at least.

The Sportsman Tourist.

Sam's Boy.

III.—A Visit to Gran'ther Hill.

One morning an air of mystery pervaded the Lovel homestead. The mistress was not visible, but some neighborly women appeared to have usurped her place. Mrs. Purington was there with Maria Hill, and Mrs. Briggs, obeying her orders as she gave them out from her rocking chair, all officious and domineering, as it seemed to Sammy, while the men of the household were correspondingly meek and subdued.

Dr. Root, the Thompsonian practitioner, was present, superintending the steeping of herbs on the stove, and his horse was put in the stable as if the period of his stay was indefinite. Breakfast was served and eaten with dispatch, as if it were quite a secondary affair, and then Uncle Lisha invited Sammy to go with him to Joseph Hill's, and the pair trudged away well content to be in each other's company, away from home with its unpleasant preponderance of femininity.

"What's gran'ma an' all them women tu aour house for, Unc' Lisher?" Sammy asked after much silent pondering of the problem.

"Oh, I guess they come tu visit along wi' the darkter," Lisha answered.

"An' wha' d' he come for?"

"I da' say tu visit along wi' them," Uncle Lisha answered, hoping there might be an end of questions. "We'll go on an' see Gran'ther Hill; he's older'n any hill raound here—older'n Tater Hill, fur's I know, an' he knows more stories'n the 'Rabian Nights' tells on. Meby he'll tell us some on 'em, 'baout Ticonderoge an' Bennin't'n, like 'nough, an' Injuns, an' wolves, an' I do' know what all."

"What was Ti—Ticon-dero—I do' know haow you say it?"

"'Derogy—Oh, that's a fort him an' another man took away from the British in ol' times."

They found the veteran sitting outside the kitchen door, shooing away the chickens with frequent flourishes of his staff, sometimes getting the end under some gawky, long-legged, too-adventurous cockerall and tossing the unsuspecting fowl in the air.

"Jozeff's womern is bedivil ed arter chickens!" he remarked to the visitors after a successful toss. "An' I'd rather hev the devil raound me—the idgets!"

"Pooty middlin' good they be stewed or friggseed," said Uncle Lisha.

"I'd livser hev a pa'tridge," said Gran'ther Hill.

"Yes, but them ye can't git ary minute you take a notion," Lisha remarked.

"Meby you can't; but me an' that 'ere boy can, an' we'll show ye some day, won't us, Bub?"

Sammy modestly assented.

"But ye can't go aout an' find a pa'tridge nest any time."

"Wal, oncte I faound a pa'tridge nest just at the right minute."

"An' haow was that, Cap'n Hill?"

"I was a-scaoutin' clust tu the inemy, wi' not a maou'ful t'eat in my knapsack, an' afeared tu shoot on account o' showin' where I was. I tell ye, it was all-killin' tough tu see a pa'tridge struttin' along ahead on ye, or a rabbit a-skippin' away, or a deer get up an' stretch hisself when yer stomach was a-cryin' cupboard so you was ready tu eat yer moccasin strings, an' you da's'n't shoot. Oncte a deer got up that way, an' I see an Injin rise up from behind a lawg not ten rod off, an' p'int his gun at him, an' a-lookin' mighty hungry an' wishful. But he da's'n't shoot no more 'n me, an' by an' by went a-sneekin' off a-huntin' sech game as me, an' me a-hankerin' for his scalp.

"When all tu oncte a pa'tridge scooted aout from most under my foot, an' there lay a dozen white aigs. I jest dropped daown aside on 'em an' gobbled 'em. I do' know but the' was young birds in 'em as big as bumble bees. I didn't stop tu ask no questions, an' I never eat a better meal. The next thing I hed t' eat was a han'ful o' no-cake aouten a dead Injin's bag."

"'Taint good tu hev no-cake, is't, Unc' Lisher?" Sammy asked with round wistful eyes on the grim, gaunt old story-teller.

"It's paounded popcorn he means, an' leetle boys likes that."

While Uncle Lisha was speaking, the old man hobbled to a cupboard across the room, reached his hand into an earthen jar, and brought back two heart-shaped seed cookies.

"There, Sammy, see if them ain't better'n no-cake."

"I b'lieve I've hearn tell haow you was tu Ticonderoge, Cap'n Hill?" Uncle Lisha delicately suggested.

"Me! Wal, I rather guess I was; the secont man inside arter Ol' Ethan an' that Beeman boy. By the Lord Harry! It allers tickled me for tu hear tell what Ethan said when he met the Cap'n. He writ a book a-tellin' on't, haow he demanded the fort, 'In the name o' the Gr't Jehover an' the Continental Congress,' an' haow he talked tu us arter we landed. Says he, 'Boys, it'll be daylight afore them lazy bones gits here, an' aour cake'll all be dough. You that's for goin' ahead, p'ise your firelocks, an' don't ye du it if you're a lot o' dammed caowards'; an' when he come tu the Cap'n's quarters he says, says he, 'Come aout o' yer hole, you dammed ol' skunk, or by the' Gre't Jehover I'll let daylight through yer.' Them's the words he said! He didn't stop for tu make no Fourth of July speech."

"Did he ever know any wolves, real ones, Unc' Lisher?" the young listener whispered, covertly, yet overheard.

"Law, yes, no eend on 'em. Why, he act'ally shot the last wolf 'at ever come tu Danvis!"

"Was it wolves he was a-askin'?" Gran'ther Hill demanded. "Lord Harry, I guess you'd 'a' thought so when I fust come tu Danvis. It was oooo! here an' oooo! there as soon as ever night come, till they'd killed off all the deer, an' you might as well try for tu keep chickens in a weasel hole as tu keep a sheep anywher's! But they got trapped an' hunted off arter a spell, till the' wa'n't none left here 'ceptin' one ol' she, 'at kep' up on Tater Hill. She raised a litter reg'lar, an' every night daown she'd come off'n the maountain an' crost the river an' git her belly full o' mutton, an' take it back tu her whelps, an' the' couldn't nob'dy git a sight on her nor ketch her, she was that cunnin'. So one day I took me a trap on my shoulder, an' I took tu the river a-wadin' along, till by'm by I faound a path where the ol' rip come daown for tu cross, an' there I sot my trap wi' a sod on the pan abaout a step from the shore, an' next morning' it was gone, bob an' sinker, an' I follered up the trail an' faoun' the ol' varmint lookin' 'shamed enough. When I'd killed her an' skun her, I follered up the path an' faoun' the den, an' the next thing was for tu git the cubs.

"When I reckoned they'd got hungry 'nough tu be kerless I baited a hook wi' mutton, an' when they'd grab it I'd yank 'em aout, till I got three. I allers cal'lated there was one more, an' I 'spect the ol' he, he raised him, an' he come back arter a spell, an' was the one I killed tew year ago. I'll take ye up there an' show ye the place some day, Bub, when you git big enough tu go huntin'. You'll take tu it, I know by the way ye tousled that fox skin 'fore ye could walk. He'd make a boy if I hed the raisin' on him, an' it warn't for his hevin' sech a gran'marm."

"It's ruther late for him to help that, Cap'n Hill," said Uncle Lisha.

"I spusso," the veteran reluctantly assented. "But the ol' critter might die off. I wonder if I can't find him some o' Mari's sweet-flag candy. That 'ere's fust chop for leetle boys, if aour Bub an' amongst 'em hain't eat it all up."

"Wolves!" Gran'ther Hill mused as he bestowed a handful of sliced calamus root candied in maple sugar upon his youthful guest. "Lord Harry, Lisher! Don't you remember what a hullaballoo the' was over what's-

GOVERNOR.

his-name a-bein' eat up by wolves in his sugar camp? There was his bones—sheep's bones they was, an' I wonder the critter hed sense enough tu take huffs off, an' the snow all trampled up by the wolves—every identical track made wi' a right forepaw! An' his women hed a fun'ral over them bones, an' buried 'em an' put up a gravestun: 'He is not dead, but sleepeth!' Sure 'nough, so he was, way aout in York State! It wa'n't much that way with Jim Walker an' Ike Warner, which I s'pose you've heered on time an' ag'in; but Bub here never did.

"They was a-comin' from a loggin' bee arter dark an' there was a mess o' wolves took arter 'em. Jim an' Ike hed both ben arter the same gal, nip an' tuck, for a year, but Ike got the whip hand an' got the gal. Jim didn't lay it up ag'in Ike none, but was jes' as good friends as ever, an' thought just as much of Phebe. Wal, the wolves kep' a-gittin' sassier an' they hedn't ary gun, an' the darker it got the cluster the wolves come an' it begun tu look mighty ser'ous, an' they kep' a hus'lin' an' a-lookin' for a tree they could climb, but it 'peared as if the very woods was ag'in 'em, an' every tree a-swellin' up bigger'n a man could hug, an' a-holdin' up its branches 10 foot higher 'n ever. They got tu runnin' at last, an' Ike, he was the shortest winded an' shortest laiged, but Jim never left him behind, an' kep' a-encouragin' on him, a-tellin' on him 'baout Phebe an' the baby. Bye-m-bye Jim faced about an' ketched Ike by the hand. 'Good-bye,' says he, 'an' now run for your life whilst I hold 'em a spell.' Ike run on, a-lookin' back over his shoulder naow an' agin, an' there stood Jim steddy as a rock, wi' his club up an' ready.

"At fust the wolves stood off kinder shy—then they come a-jumpin' an' a-snappin', an' daown come the club like a flail, a-lyin' aout a wolf 'baout every time. But the last time he looked the' wa'n't no Jim—only a black swarm a-surgin' back an' tew on the graound in the dusk, an' that was the last he seen. Ike never wanted tu talk much 'baout that, but he done more 'n any other ten men tu clean the wolves aouten this country. He trapped 'em an' he p'isened 'em, an' if the' was a wolf hunt within twenty mild he was in it.

"One day he went a-huntin' an' never come back, an' we rallied aout tu s'arch for him. I was the fust one come on tu him, a-layin' on his back wi' a big painter atop on him. The wind was a-blowin' strong an' the critter's tail was a wavin' in 't as nat'ral as life—jest that ugly twitch cat critters hes when they're settin' their teeth into their game, an' I up wi' my gun an' gin it tu him jest behind the shoulder; but the' wa'n't a stir. The critter was dead as hay, wi Ike's bullet through his heart.

"Ah, wal, these 'ere woods hain't what they uster be," the veteran sighed, casting a regretful glance upon the broad sweep of forest that stooped from the lofty mountain crests to the narrow level of cleared land. "The' hain't nothin' in 'em naow bigger 'n a fox, nor dang'rouser 'n a coon—'ceptin' naow an' ag'in a bear."

To the little boy they looked as illimitable as the sky and as full of mystery, and why not full of such tragedies as this he had just heard? Some day, when he grew to be a man—not so old as Gran'ther Hill nor so fat as Uncle Lisha, for these he could not be, but something like that paragon of men, his father—that wonderful realm of shade and strange sounds would be open to him as it was now to them, and then what sights he would see and be a teller of tales to little boys. So with far-away gaze where the cloud shadows swept across the green roof of the woods, he dreamed the unspeakable dreams of childhood—the dreams that are realities never needing to come truer—while the two old men droned on of common affairs not worth being true.

By and by Ruby had a dinner ready for them concerning which she was nervously anxious, it being her first attempt to accomplish such a feat alone. But it was all that could be desired by a company blessed with such appetites. The potatoes were puffs of meal; the dandelion greens were tender; the pork boiled to just the right degree, and the Indian pudding was as good as her mother's. She could not ask for greater praise than her grandfather gave her when he said:

"I'm almighty glad they named you Ruby arter your gran'mother!"

In the afternoon the youngsters played "Injun" and hunted wolves, and when the cows were coming home lowing for their imprisoned calves, Uncle Lisha again bent his waxy forefinger to the clasp of Sammy's chubby palm and the pair wended their way homeward.

Rowland E. Robinson.

[To be continued next week.]

In Old Virginia.—V.

I heard my good friend Aunt Ellen indulging in a lengthy and indignant protest, one morning, and having nothing important on hand at the time, strolled around to gather its import.

I found her in the back yard delivering a violent philippic in the general direction of a patch of timber, but its object was not in sight.

Drawing near I heard: "Yo' nasty ole robbah. Yo' stealin' ole raskel. If evah I do git my han' on yo', I'll twis' y o' ole head off an' feed yo' to de hawgs. Yo' mean ole speckled flyin' pirate, yo'."

"What is it, Aunt Ellen?" I asked.

"Hawk, suh," she replied, shaking her fist in the direction of the woods. "Hen hawk, suh, an' he des carried off de bes' pullet I had, right from befo' de doah, an' me holl'n' des loud as I kin to mek him drop hit. De audashus ole re-probate.

"Dey is de meanes' varmints dat runs, crawls or flies, an' I 'spise 'em wus' dan pizen.

"He been comin' mos' ev'y day, an' always git a chickun, an' a good fat one, too. I ain' goin' have no nise chickun lef' foh Mis' Lady to eat ef he doan quit hit."

Just then a thought occurred to her, and turning, she said: "Can yo' git yo' gun an' kill him fo' me, suh? I sho' would be 'bleeged to yo', an' so would Mis' Lady."

Questioning her at length as to the hawk's line of retreat, and gathering all possible information as to his probable haunt in the woods, I promised to do my best, and a few moments later entered the woods where he was supposed to be, armed with my 16-gauge, loaded with chilled sixes, and followed by the faithful companion of all my hunts, the small boy Gov'nah.

Slipping along through the thick woods we worked back and forth several times before starting anything, and then flushed the object of our search from a thick pine, but did not get a shot. Taking his direction and traveling slowly and cautiously, we finally started him again. It was a long, hard shot, but at the first barrel he faltered, and at the second fell down through the trees a good 50 yards from where I stood.

Governor made for him, and before I could call out a warning to be careful, had pounced down on the hawk, as he had learned to do on the quail he had been retrieving for me. There was a quick thrashing of wings and an involuntary cry of pain from the boy, and the first round ended decidedly in favor of the winged, but game, bird. Snatching up a convenient stick, the boy rushed in again, and with a well-directed blow across the neck knocked all of the fight out of the pugnacious chicken stealer.

Proudly bearing the enemy, and trying to conceal the pain caused by a badly lacerated hand, the boy returned to where I stood.

"You got him, did you, Governor?" I asked.

"Yaas, suh." Short and sharp as usual.

"What is the matter with your hand?"

"He bit me, suh."

"Bit you," said I, noting the long, ugly scratches that were bleeding freely. "How?"

"Wid his foot, suh," was the reply.

Bandaging up the wounded hand, without a word of complaint from the little hero, we returned to the house, where the boy had the proud satisfaction of displaying his trophy first to Miss Lady, who commended him, and then to Aunt Ellen, who almost overwhelmed him with loud praise.

"Dat's him. Dat's de very ole scound'el. I knows him des es well as if I see my chickun in his insides. Dat sho is good dat you got him, boy."

And then noting the bandaged hand: "Did he hu't yo'? Bit yo'? He did? De ole rask'l. Bring him heah, honey, 'til I take an' pull his he'd off des like I say I would, an' den we will des feed him to de hawgs des like what he deserves."

This incident reminded my hostess of a very unusual accident that had ended the career of a large predatory owl the season before, which she thus narrated:

The owl had been visiting the chickens every few nights, and finally one night tried to make off with a large hen. In attempting to fly over a high picket fence around the yard, a struggle of the chicken, or a miscalculation, caused him to drop down on the top of the pickets, and happening to get turned just right, he slipped down between two pickets with his big head on one side, and his body on the other, and being unable to pull loose, or work back up the way he got in, hung there until next

morning, when he was found by one of the negroes, who finished him with a tobacco stick, and appropriated the hen.

A smart shower coming up about noon wet the dry leaves and made an ideal afternoon for squirrels. Accompanied by my boy, I set forth to try for the necessary ingredient for one of Aunt Ellen's "Brunswick stus."

We wandered along quietly down through the woods, keeping an unused road. Governor was walking to my right, a little in the rear, when suddenly, from the tail of my eye, I saw him rise in the air like a big black cricket and light three or four feet out in the brush.

Turning quickly about, I discovered the cause of his sudden start lying in the road a few feet from where he had made his astonishing leap. It was a large copperhead snake that a decided moderation in the temperature had tempted forth. Big and ugly as he was, he was too much overcome by the lethergy of the cold season to be at all dangerous, and paid no attention to us, further than the usual tongue darting incident to the entire serpent species.

Blowing off his head with a charge of shot, we resumed our interrupted hunt. We found our first squirrel in a hickory "cutting," and killed him with dispatch and ease. The next hickory yielded a pair, killed "right and left." A little further on we found an old fellow traveling across country, from tree to tree, and as he ran out the limb of a big white oak, I knocked two feet loose with the right barrel, but had to repeat the dose before he would come down.

He lit running, with my little black sportsman hot after him. It was a pretty race, and I let them have it out.

Down through the woods they went, the squirrel barely keeping ahead of the stick that was cutting the leaves just behind him. Twice he made a tree, but was knocked off before he could climb out of reach, and finally was knocked out by a side lick as he tried to jump a log, and brought to me in triumph by the panting boy.

We had enough fur, and I concluded to swing round through the fields and try to put up a covey of birds. Just before leaving the woods a flicker, or yellowhammer, lit in a tree, within range, and I concluded to kill him for the boy. He dropped at the crack of the gun and lay apparently dead, until Governor had run to him, and was stooping to pick him up, when with a rush he rose and flew entirely out of sight and hearing. Too much surprised for speech, the boy stood looking after the bird until it disappeared, and then, apparently thinking that I was due an explanation, turned and said: "You ain' kill him, suh. You ain' tech him. You des sca'ed him."

We found the birds, and scattered them in a good piece of stubble. One stopped on the flush, and another left a few feathers, but was able to carry away what we wanted of him.

An unwary hawk pitched out of a thick tree a few minutes later, and was clean killed at the first shot; but the boy made several pilgrimages around it, viewing it from all sides and fully assuring himself that it was quite dead before offering to pick it up to carry in to show to the enemy of its race, the good old cook. Four birds were all that we succeeded in bringing to bag after this, but these, together with our squirrels, made a very respectable showing for a short round. Arriving at the house and finding enough sunshine left, I concluded to photograph the boy with my kodak. It was his first experience, but his natural dignity made him a fine subject, as he stood proudly erect with the gun on his shoulder and the birds in his hand. His mother arrived on the scene just as I had made all preparations, and anxiously inquired of my hostess: "What dat man doin' to Gov'nah?" When informed that Governor was having his picture taken, she proceeded to protest vigorously and volubly. "Why, Mis' Lady, doan you all go an take Gov'nah's picter an' he in his ole close. Ain' got no stockin's on, neither, an' only one gallus. Good Lawd, Mis' Lady! lemme go an' put his good close on him, den he look like sumboddy. Come heah, Gov'nah. Come heah, suh! You heah me? I ain' goin' have you look like dat in a picter; hit be scan'l'us." The little fellow stood like an image through the length of this protest, never so much as winking an eye, and before the protest was completed his "picter was took." His mother was nearly inconsolable, but a promise to take him again in his "good close" finally appeased her.

The active pleasures of the day now gave way to the quiet of the cool evening. My hostess and I strolled down the winding road leading from the house to the "quarters," as the cluster of houses occupied by the laborers on the plantation continued to be called. The dense woods bordered one side of the road, the trees blazing in their remnant of autumn foliage, and on the other side lay the sloping meadow where the lowing herd, restless with the expectation of evening attention, stood waiting near the bars.

An old negro woman in her cabin door wailed and quavered a song, a weirdly sweet old minor air, full of music and pathos to those born and bred in "Dixie Land," but calculated to start "goose flesh" all over the anatomy of one not to the "manner born."

The field hands were coming up the lane from work, bringing in the teams; and their happy shouts and laughter mingling with the merry jingles of the trace chains, all combined to make known that the day's work was done, and the hour of rest at hand.

The last red bars of fading sunlight fell across the clear still surface of the ice pond, turning it to molten gold.

The distant tinkle of musical sheep bells, with now and then the bleat of a straying lamb, came faintly up from the woods pasture; while from the direction of the house, clear and shrill, was heard the weird scream of the peafowl, seeking its nightly roosting place in the great white oak tree.

All of these homely sights and sounds combined to make a pastoral scene dear to the heart of one in touch with the beauties of rural life.

Down by the great log tobacco barn, where the air was fragrant with the sweet savor of the drying weed, we met old Uncle John, the oldest darky on the plantation, and a real old-timer. His kindly old wrinkled face was beautiful, shining through the halo of snowy hair and beard. He was moving slowly toward us, leaning heavily on his hickory stick.

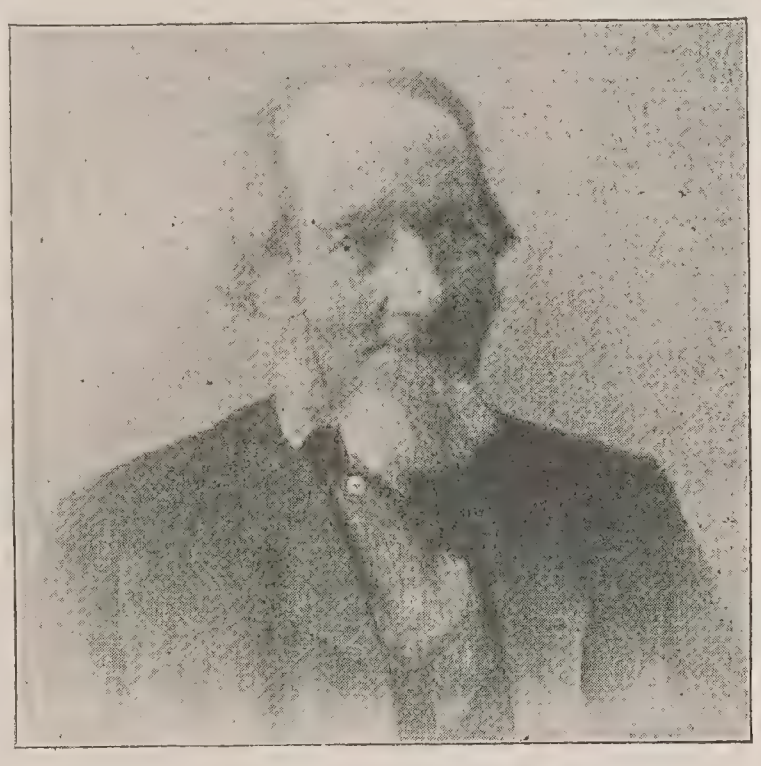
"Good evenin', young mistis' and marstah; I proud to see you, an' hope you is well," was his greeting, as with hat in hand he bends still lower his poor old bent body in a bow full of natural grace and courtliness. We respond to his greeting, and my companion inquires as to his health. "Tol'ble, mistis, des tol'ble, thank you," is the reply. (The real old darky never gets beyond "tolerable.") "I ain' rite pert dis evenin', but I bettah den I has been. Yistiddy I was rite poo'ly, ma'm, rite poo'ly." Expressing regret at his indisposition, and the hope that he may continue to improve, we receive another low bow, accompanied with: "Thank you, ma'm, an suh; thank you both. Good evenin'."

The twilight is deepening when returning we draw near the house, and the whippoorwill is calling from the grove. "All the world a solemn stillness holds," and "the day is done."

LEWIS HOPKINS.

Antler.

ANTLER is dead. The gentle, kindly old man has gone to his reward, and desolation reigns in the little log cabin up among the Tennessee Mountains.



He longed to go, but the strong vitality which carried him through eighty-six years was reluctant to give him up, and he passed away only after a long and painful illness.

One of the most cherished names of his declining years was that of the immortal Nessmuk, and we doubt not but that if he had his choice in the hereafter it would be to pitch his tent alongside that of his old friend, the poet woodsman.

In an April, '97, number of FOREST AND STREAM is the brief sketch of his life, and photograph taken at that time.

Mr. Stratton was a man of quiet and unassuming manner, a kind and obliging neighbor, beloved and respected by all who knew him; a student of nature in all her aspects, he loved his mountain home, the woods and birds, the blue peaks and valleys to be seen from his door.

In his early life, as a pioneer among the Alleghanies, he

E. L. STRATTON—ANTLER—1812-1899.

was undoubtedly a Nimrod of no mean ability, and a true sportsman, and though this characteristic was prominent to the last, yet he realized that he had the weight of many years upon him, that he had long since reached the land "where 'tis always afternoon."

Mr. Stratton was a worthy member of the FOREST AND STREAM family, and one of nature's noblemen.

CAMERAMBLER.

BISCAYNE BAY, Fla

With the portrait sent by our correspondent in 1896, we quote from his letter:

"In 1874, being in very poor health, Mr. Stratton moved to the mountains of East Tennessee, locating at Grand View, a small town on the eastern edge of Walden's Ridge and overlooking the Tennessee Valley.

"Here in a sheltered spot, and near a good spring that does not fail him in the driest season, he built his log cabin, and here you will find him to-day. The pure, bracing mountain air of this mild climate proved to be exactly the thing for his failing lungs, and after a residence here of twenty-two years he is still very much alive.

"For one who is looikng for an all-the-year-round climate there is none better in America than these mountain heights of East Tennessee; neither too far North nor South, where the winters are mild and open, and usually no snowfall.

"In summer the thermometer rarely registers above 90 degrees, and the nights are always so cold that a man feels the need of a warm blanket, and can sleep his eight hours every night.

"The water is pure and soft, and malaria and mosquitoes are things unknown.

"Such my friend has found here, and he affirms that he 'will not go back on the bridge that has carried him safely over.'

"Though past the age for active participation in his lifelong pastime of deer hunting, he dearly loves to stir up the back-log in his capacious fireplace, and seated in a splint-bottomed chair before its genial blaze recount his many adventures of long ago, in which (I suspect) his trusty rifle rarely barked in vain.

"Mr. Stratton is a great admirer of the writings of the immortal Nessmuk, and was a regular correspondent of his for years previous to his death, and never tires of discussing that woodsman.

"Though long past the alloted three score and ten, our friend is as light of heart as a boy, and for a man of his years remarkably active, and in his tramps around the mountains might tire out many a younger man."

A Southern National Park.

A MOVEMENT is on foot for the establishment of a national park in the Southern mountains, the chief range of which is known as the Blue Ridge. This is almost in the center of what may be called the old States. North and South Carolina, West Virginia, Tennessee, Alabama, Georgia, all unite in this range of mountains, which is the watershed of a large number of large rivers which flow into the Atlantic and the Gulf of Mexico, and in which there are countless clear cold streams which are the homes of the speckled trout and other game fish which exist in abundance. This extensive tract reaches from Asheville on the east to middle Georgia and Alabama on the west, and to the low country on the south and north.

It is a sea of mountains which, viewed from the top of the highest peak, appears like the great ocean with its rolling billows, a very sea of waves, and valleys, lying in confusion, and all covered by the most valuable timber, 10 per cent. only of the land being occupied by farms, and only 10 per cent. of these lands being cleared. In fact, the view as it appears from the highest points, 5,000 to 6,000 feet above sea level, is only marked here and there by a clearing, the rest of the landscape being one continuous mass of forest. Mountains and hills in ranges cross each other, and other lesser ranges cross these, making an endless ocean of forest, divided into interminable waves, until it is possible to distinguish the major peaks only as they appear above the lower ranges. Of these greater peaks there are these:

Black Rock, 4,500 feet; Wildcat Ridge, 4,200; Whittier Mountain, 4,931 feet; Whiteside—so named from a gigantic perpendicular cliff of feldspar, 2,000 feet in height on its face—5,000 feet; Shortoff Mountain, 5,000 feet; Yellow Mountain, 5,132 feet; Black Mountain, 4,900; Hog Back, 5,100 feet, and many others over 4,000 feet. In the midst of these the town of Highlands nestles in a gap 4,100 feet above sea level, and from this clean, charming and most delightful and salubrious town all these peaks mentioned may be reached by an easy horseback or buggy ride. From these heights one sees below the mentioned peaks an ocean of verdant lesser mountains, in ranges crossed and recrossed many times, and down the valleys separating these ranges pour in rapids and cascades, white with foam and musical with liquid purling and crashing, the uncountable small brooks which rush down rapids or tumble over the rocky precipices. The uncountable springs and small streams unite to form the rivers, and these form a succession of rapids as they tumble down the heights which rise from the lowlands fifty miles below. The town mentioned is in the center of this great expanse of mountain and forest and verdure and flowers, and the county of which Highlands is the second important town has seventeen peaks that exceed 5,000 feet in height above sea level.

The importance of this mountain region with its dense forests and enormous watershed, surpassing all other localities in the United States for its volume—for the annual fall of rain is some years a hundred inches, and occasionally has measured by gauge a hundred and thirty inches—cannot be over-estimated. This enormous quantity of water soaks into the land covered by the dense forests, and thus gradually supplies the rivers below, the waters of which fertilize the soil and supply the power for hundreds of mills in every direction. This water power in North Carolina alone amounts to over one million horse-power.

From business acquaintance with the value of the timber, I estimate the existing supply over two hundred square miles, each way from this center, to be worth at least $10 an acre as soon as it may be brought under the supervision of capable forest supervision; and as this existing supply is made available the new growth under scientific culture will have an annual value of at least half this amount. From hoop poles up to magnificent white and yellow pines, poplars, oaks, chestnut, hickory, the valuable black birch, and cherry, and with the dog woods, locust and smaller timber, this value may easily be doubled as soon as the right attention is given and intelligent forestry is established. Every tree native to the United States, except the live oak, grows in this region, while hundreds of flowering bushes and plants, grown elsewhere as garden products, embower the woods with a blaze of brilliant color in the season.

Game of all the smaller sorts abounds all over. Deer, bears, and all the birds abound, and even wild hogs—the produce of swine which have escaped from the scattered farms—are quite numerous in the denser laurel thickets. California trout, which I introduced twelve years ago, have spread all over this region, and have reached the Tennessee River—some of them in my waters are 10 or 12 pounds weight—while the common brook trout are taken of 3 pounds weight.

In short, the necessities of the case are such that this unsurpassed region in the eastern part of the United States, if for the safety of the water supply alone, demands that the Federal Government should acquire at least two hundred square miles of this region, if only for the preservation of it from destruction, and the consequent vast damage to the public interest from the mountains to the ocean. Many readers of FOREST AND STREAM have visited this region, and will vouch for all these statements. But by a little attention to the protection and increase of game, this locality might return a good interest on the whole cost of its acquisition and maintenance, from the income from licenses to hunt and fish, if it were thought reasonable to charge for these privileges. As it is, one of the most valuable and interesting regions of the United States is going to destruction, and before long will be a desert washed by floods to the bare rocks, the unexcelled forests will be made a prey to the flames, vast floods pouring from the bare rocky surface will sweep away the low country, and droughts will prevail where now all this region is copiously watered by the droppings of the clouds, which come up from the ocean on every side, and at the mere touch of the cold mountain tops these shed their burdens of water in the form of showers, which protect and enrich, instead of devastating the whole region otherwise by their unchecked and resistless flow down the mountain sides. The occasion presents itself now to the Government to secure at a small cost all these advantages in perpetuity, to save vast losses

and damage, and the uncountable destitution which can not help but occur to the unfortunate inhabitants in the future, who are helpless against the resistless forces of nature by which this most valuable and interesting region is doomed to destruction unless the saving hand is stretched out to protect it. H. STEWART.

Lord Fairfax, the Father of Fox Hunting in America.

Fox hunting, unlike many other branches of sport, has a cult peculiarly its own, a vernacular that is as Greek to the uninitiated, and a history, unwritten 'tis true, but sacredly preserved in the traditions of the followers of horse and hound. The names of Fairfax, Henry, Birdsong, Maupin, Robinson, Lynthicum, Hardy and a host of others that the Historical Muse disdained to rescue from oblivion are still faithfully preserved and their memories revered by American fox hunters, while the musical notes of their favorite hounds still echo through the long vista of departed years.

The birthplace of fox hunting in America was in Virginia. As there were brave men before Agamemnon, so there may have been fox hunters in America before the subject of this sketch; but if so, no record of the fact remains, and after diligent research I am convinced that to Lord Fairfax belongs the honor of being the pioneer fox hunter as we now understand the term, and as contradistinguished from the mere fur hunter—the first exponent of the noble sport in its highest phases. He was an interesting character, his life a strange one, full of vicissitudes, and my regret is that I have been able to find so little about him in the mouldy memoirs of the last century, which have wasted good ink and paper upon so many less worthy characters.

As I have said, his life was one of strange contrasts, as indeed was the history of the age in which he lived. Born in the last days of the seventeenth century, to all the wealth and power of a peer of England, he lived to see, at the close of the eighteenth, the old order of things of which he had sickened, the old society with its dissolute shams and abuses, pass away before the tempest of the American Revolution. Tall and well proportioned—6 feet in height—with keen gray eyes, an aquiline nose and regular features, he cut a swell figure in the gay society of London under George I.

There are two pictures of him preserved to posterity. The first represents him as a young man in the gorgeous uniform of the famous regiment of horse called "The Blues," in which for a short time he held a commission, as was the fashion among the young nobility.

As we look at this picture we can almost hear the voice of the dead past—the laughter and the chorus, the toast called over the brimming cups, the shout at the race course or the gaming table, the coarse jokes spoken to the fine ladies who smile at us out of the old gilt frames. How fine those ladies were, painted and powdered and patched, who laughed at the indecent witticisms of Sterne and Steele and Swift; the modest maidens who wept over the misfortunes of Pamela, and smiled over the adventures of Tom Jones. How grand this fine gentleman in his gorgeous uniform—this product of the dead past—a past that has forever buried its dead, its fine gentlemen. The provender upon which they fattened no longer grows even in monarchical England. Vulgar tradesmen no longer stand hat in hand as he passes; obsequious clergy no longer bow down before him and say, "Your Worship" and "Your Honor" at every other word, and prime ministers no longer burst into tears of reverential joy, as Lord Chatham did when his royal master deigned to address a few civil words to him.

If Lord Fairfax passed his youth, as did other noble youths, in the society of the wits and Beau Brummels of that dissipated age when infidelity was endemic and the taint of corruption in the air of court and coffee house alike, we must remember that they had no incentive to be otherwise. The profession of arms was the only one open to them, and this was closed by universal peace. The church, the bar, the arts and commerce were beneath them. Lord Fairfax, being a man of wit and learning, occasionally dabbled in literature, and wrote a number of essays for Addison's Spectator. That charming gossipping valet de chambre of history to whom no man was a hero, has depicted the life of a man about town in that dissolute day, and by its help we can follow young Lord Fairfax through the gay crowd of bewigged, beruffled, embroidered, snuff-boxed and red-heeled fops that disgraced Anglo-Saxon manhood under the peaceful reigns of the first two Georges.

We can follow him through the dirty streets of old London, with its crowds of swinging chairmen, liveried lackeys and linkboys, to the theater, the puppet show, the cockpit or prize ring, after which he resorts to his favorite coffee house, where he sits down to cards with Lord Chesterfield, or some other titled blackleg, or drinks a bowl with Steele or Addison, and watches the tide of human life flow by the club windows—the fine ladies tripping to the toy shops, followed by their footboys and ogled by the gold-laced guardsmen; itinerant tradesmen vociferously hawking their wares; gilded carriages bearing courtiers to His Majesty's drawing room; the heavy stage coach with its gay postilions rumbling by, to be stopped at night on a lonely common by a masked gentleman, who thrusts a flintlock into the coach and politely calls for the passengers' purses. It was during this period that England justified its claim to the title of Merrie England. The sole occupation of men and women seemed to be to amuse themselves, and what with drinking and dining and dancing; what with cards, cockfights, horse racing and prize fighting, bull and badger baiting, May poles and Morris dances, high and low alike seemed to have abandoned all idea of useful pursuits, and one wonders what time they found for the serious business of life.

But why dwell upon this picture? However interesting as a portrayal of contemporary manners and customs, the amours and petty details of the life of a man about town in that day are repugnant to the wholesome taste of the present. No wonder that a man in whose disposition were the seeds of better things, and whose true nature was one of noble and generous impulses, having sown his wild oats, having drunk of the cup to its nauseating dregs, should sicken of this godless, intriguing, sycophantic and selfish Vanity Fair, in which servility was held to be ennobling duty, and woman's shame, when paid as the price of royal favor, was held to be no dishonor.

There is another picture that I like better to look upon, the picture of the Virginian Lord Fairfax, the kindly country gentleman who devoted his days to the innocent pleasures of the chase, and was the benefactor of all with whom he came in contact, the philosopher who tore from his breast distinction's worthless badge, and giving up his title and estates in England to his younger brother began a new life, in a new world, among a new race of men—men who were born free men.

One fine fall morning in 1747 a youth was jogging leisurely along a road that wound along a wooded ridge in old Virginia, a mere boy of sixteen years, but his large and powerful frame, as well as the air of serious dignity which was the characteristic expression of his strong featured face, gave him the appearance of being much older. He had evidently paid a little extra attention to his toilet that morning. His blue frock, with its plate buttons, and his buckskin breeches bore evidence of having been carefully brushed, and the erect figure served to defy them to wrinkle or crease. A portmanteau behind his saddle evidenced that he was bound upon one of those visits which the gregarious gentry of the Old Dominion were so constantly interchanging. His mount testified to the Virginian's passion for horses—a handsome animal, nearly thoroughbred, with clean flat legs and splendid hocks. No young gentleman of that day rode abroad upon a cold-blooded hack.

As he rode gravely along, occupied with those deep and weighty thoughts which grave young gentlemen just out of school feel called upon to ponder, his sober face suddenly lit up with boyish fire and enthusiasm, as there came borne to his ears through the frosty air the fierce melody of hounds in full cry. Through the distant woodlands, which were kindling into flame before the first frosts, he could catch the silvery shimmer of water where the broad Potomac flowed a mile or more away, and he at once divined that the deer would take to the river to shake its pursuers, and wheeled his horse's head in that direction. But the next moment the cry swelling in volume as it approached, showed that the hunted animal, contrary to all precedents, was bearing away from the river, and clapping spurs to his steed he dashed down the road to intercept the chase.

On came the hounds, with their thrilling melody. How he wished for his gun! Pulling his horse to its haunches when opposite them, he strove to pierce the network of woods through which they were racing toward him for the first glimpse of their quarry. They were almost upon him. Through the interlacing limbs and leaves he could dimly descry the black, white and tan forms of the oncoming dogs. But he looked in vain for some startled deer to burst from the brush. Suddenly a lithe little form flashed into the road before him, and squatting for a moment at sight of him, whisked a ruddy plume above its back and dodged back into the brush again. The next moment the hounds streamed across the road, and on the other side threw up their heads at a loss.

He had but a fleeting glimpse of the little animal, and his first impression was that it was a fox, but, as every farmer's boy knew, foxes were as gray as a badger. His next thought was that they were pursuing some negro's little yellow cur, as riotous hounds are notoriously fond of doing, and he regretted that he had not whistled to the frightened little animal. As the hounds cast back for the trail he rated them harshly, endeavoring to turn them, but desisted suddenly in this laudable effort, as their irate master came crashing through the woods in their wake firing a volley of oaths at the disconcerted youth, and demanding to know what he meant by interfering with his hounds. He was an old man, but the snows of sixty winters upon his head could not bow his tall, erect figure. He was mounted upon a powerful coal black thoroughbred, 16 hands high, and rode like an Indian. A twisted hunting horn was slung over his shoulder, and a spare stirrup leather hung round his horse's neck. His gray eyes flashed fire, his face was purple with fury, and he was almost inarticulate with rage as he shook his hunting crop at the intruder who had spoiled his sport.

"Ha! Have at him, there, Blueskin!" he exclaimed, his anger suddenly vanishing as a favorite hound cast back, and striking the trail gave tongue. "Hoic in there, my beauties," he cried, cracking his whip at the laggards. "That's gospel, I warrant you. That's the way the fox has gone," and blowing his horn to collect the scattered pack, he crammed spurs into his horse and dashed past the astonished youth like a shot.

He had hardly disappeared after the hounds that had once more taken up the line, when a newcomer appeared upon the scene, a queer little old fellow in a tattered livery and a scratched nose, from which the blood trickled. He touched his hat respectfully with the deferential manner of an upper servant, and in a broad brogue inquired which way "his lordship and the h'unds gan."

His Lordship! Then this was Lord Fairfax, to visit whom at his seat on the Potomac, Belvoir, the youth was on his way. He had heard that his lordship was "ecentric." He was ready now to testify to the truth of the rumor. His introduction had not been a very propitious one, and he bade adieu to the hopes he had treasured of obtaining employment in surveying his vast domains beyond the Blue Ridge, which he had understood his lordship intended having run off. His astonishment was increased to find from old Peter, his lordship's whipper-in, that it was a red fox they were after, Lord Fairfax having been disgusted with the dodging, doubling gray fox, and imported a number of the English species to afford better sport. This serious-minded young man, for whom Fate had destined such heavy responsibilities, was not much given to humor even as a boy, but the idiosyncrasies of this eccentric nobleman, who had occupied such a prominent place in European life, daring the fate of Absalom and tearing himself to pieces through the brush in pursuit of such vermin, appealed to his sense of the ridiculous. Had a deer been the quarry he could have understood it, but a fox, for which he could have no use when caught—it surpassed his comprehension. Old Peter was not far from agreeing with him. In his native country over the open downs, with a big field of lords and ladies to applaud his performance, it was one thing; but here in this God-forsaken wilderness, with logs to fall over and sink holes to fall into, and grapevines to hang upon, it was quite another, as he ruefully confessed, while stanching the flow of blood from his nose.

But suddenly the hounds, which had gone out of hearing behind a wooden ridge, swung back toward them, and the old whipper-in, forgetful of his injury, stood erect in his stirrups, his weather-beaten face alight with the inspiration of the chase, while his horse pricked its ears and whinnied with delight.

"Dash my vig, but he's a tough un," he exclaimed, enthusiastically. "I thought they'd cracked his back, but here he comes as fresh as ever—raal Hinglish fox, that. Aye, but there's a grand scent—ivery h'und's at him. Just hark to milord," as he could be heard capping the hounds on. "Turrible bloody spinney, they're comin' through now. Wouldn't follow milord through it ag'in for nothin' under knighthood. Hark to them!" he cried, rapturously, as a particularly melodious note was heard in advance of all the rest. "Whoay, 'oss; whoay, I say," to his steed, whose impatience prevented him from listening to the redoubtable Blueskin. "Now, fool, vot are you champin' the bit for. He's doubled back again!" as the melodious cry ceased. "Hoic back—they've overrun the scent, or," added he enthusiastically, as the silence continued unbroken, "mebbe Blueskin ha' cotch 'im—come an!" and clapping spurs to his restive mount he led the way, the youth following out of curiosity, through the woods and across the open to where, on a fallow field, at the edge of a copse, Lord Fairfax was disconsolately sitting his foam-covered steed, while the hounds trotted about utterly at a loss. The oaths which he fulminated against his whipper-in as soon as he was within range convinced that menial that his hopes were unfounded. The fox had tricked the dogs completely, and disappeared without leaving a trail, possibly by running his back track. Lord Fairfax had cast up wind and down wind and round about wind equally in vain, and was now as chagrined as his dogs were discouraged. It was some relief to curse his incompetent whipper-in, swearing he should never be allowed to ride to hounds again, that he was as much out of place in the hunting field "as a cow in an opera box." Suddenly ceasing this tirade, he appeared for a moment to be listening intently, and then spurred to the top of a little hill near by.

Lord Fairfax was a hunter as well as a rider, and a better never followed hounds. He had the born sportsman's intuitive knowledge of his game. He saw and heard things that others never noticed. He had heard a killdee with its noisy cry arise from the meadow beyond the little hill. All his dogs were around him, having given up the hunt, and he at once suspicioned that the bird might have been startled by the fox slipping off through the meadow.

For a moment the young surveyor and the old whipper-in saw his lordship standing on the summit of the little hill, an equestrian statue outlined against the blue autumnal sky. The next moment his hat was in the air, and he was wildly waving and shouting, "Gone away! Tally ho! Tally ho! Gone away!"

The late lethargic hounds were galvanized into sudden action, and streamed away full cry toward their master. "Gan away, h'unds! Gan away!" bawled old Peter, cracking his whip at their vanishing heels and deluding himself with the idea that he was speeding their departure. Imbued with the excitement that infected man and master, horses and hounds, the young surveyor gave reign to his eager mount and joined in the chase. Over the hill and down the slope they swept into the broad meadow like a charge of cavalry, and the young man found himself shouting like mad, and riding with elbows and legs to outpace the old hunter. Across the meadow, over a rail fence and into the woods they went with the hounds gaining on the fox at every jump. Had its protecting shelter been a hundred yards further off they would have bowled him over ere he reached it. But now they were reduced to their noses and their mouths. How they made the woods ring! The exhilaration of the chase was seething in the boy's veins. He understood now why the old lord hunted the fox. Such a flight is among heroic feats and fills one with the fire of valor, a keen shivering glee flashes through your soul and you feel as if you could fly on forever. There is no sensation in all the field of sport to compare with it. It was Ajax's first experience in the hunting field, as it was his young rider's, but the blood of his thoroughbred sires was flowing like fire through his veins, and he fairly threw woods and fields behind him as he raced after the hounds, while Lord Fairfax's mount had been ridden hard and no longer sprang to whip or spur, but gave unmistakable signs of satiety, and fell further and further behind.

"Come on," roared his lordship, waving his arm frantically, as on crossing a road he spied Peter leisurely riding it, paralleling the hounds and ready to cut in at the first favorable turn in the chase—a proceeding beneath the contempt of straight riding hunters. "Come on, you miserable, road-riding blankety-blank! you preter-pluperfect tense of humbugs. Come on, and give me that quad. You're a disgrace to a saddle," and dismounting from his pumped-out mount he sprang upon Peter's much fresher one. Galloping up the road from a little rising ground, he caught a view of the chase as it burst from the woods a quarter of a mile away, the young surveyor riding and whooping as hard as ever he could, having forced the fox out into the open.

"How that chap can ride!" he ejaculated, as the youth flew the staked and ridered rail fence, and neatly aiding his horse to recover its legs scuttled away with the hounds on the heels of the flying fox, the woods re-echoing their deep-toned music. They have run from scent to view, and the fox's moments are numbered. The hounds, too, are worn with the long chase, and no longer press forward in eager jealousy, but each seems settled in his place, and Blueskin retains the lead, which is rightly his by virtue of superior speed and endurance,

unchallenged by the ambitious youngsters. Anticipating the next turn in the chase, Lord Fairfax cuts obliquely through a little copse, and coming out on the other side sees the fox, dead beat, tongue out and brush dragging, not a dozen paces in front of the fleet Blueskin, who opens a wide gap between himself and the pack, as he closes on his quarry. The next moment he is upon him. A snap, a turn, a roll, and it's all over with Reynard.

The next moment the young surveyor was off his horse, and diving down amid the scrambling pack straightened up again with the fox, grinning in grim death, in one hand and his hat in the other, waving and whooping in boyish excitement to the equally frantic dogs that fawned and leaped upon him. And then his enthusiasm subsided suddenly, as Lord Fairfax flashed upon his view, and he realized that there was a spectator to his frenzy. But the old sportsman quickly reassured him. Springing from his horse, he grasped his hand warmly, and told him that the sentiment did him honor, that it proved him a true sportsman and that he was glad to renew his own youth in the acquaintance of such a congenial nature. And then, whipping off the brush, he danced about exuberantly, laughing amid the baying pack until, having tantalized them sufficiently, he flung the fox to them with the time-honored cry, "Tear 'im and eat 'im."

This interesting rite performed with due ceremonial, and his favorite Blueskin duly caressed, his lordship turned to present the brush to his young friend, and it occurring to him for the first time, asked who the devil his young friend was anyhow.

Having a letter of introduction to his lordship in his portmanteau, the young gentleman turned to procure it, but alas, Ajax had parted company with the portmanteau some five miles back, and he was compelled to simply introduce himself as George Washington, the young brother of Lawrence Washington, who had married the daughter of Mr. William Fairfax, his lordship's cousin. But it is doubtful if any letter of introduction could have had the influence upon this eccentric sportsman that the spirit the youth had displayed in the chase effected. From that moment, despite their disparity in years, they were fast friends, a friendship which meant much to young George Washington, and through him was destined to affect the history of the world. Step by step we can trace the influence of Lord Fairfax upon the career of Washington. Lord Fairfax had inherited from his grandfather, Lord Culpepper, all the land lying between the Potomac and Rapphannock rivers, comprising some six million acres. As yet no surveyor's chain had ever been carried over any portion of his broad domains west of the Blue Ridge, and including the now famous and fertile "Valley of Virginia."

Washington spent the fall and winter fox hunting with Lord Fairfax, and preparing for his trip into this terra incognita. In March he set out, and acquitted himself so well that Lord Fairfax had him appointed public surveyor upon his return. His report of the country was so glowing that Lord Fairfax visited it himself, and was equally enraptured with that beautiful valley to which the Indians had given the name of Shenandoah, "Daughter of the Stars." On a green knoll overshadowed by ancient forest trees, about twelve miles from the present town of Winchester, the old sportsman erected a hunting lodge in the wilderness, and gave up to his cousin, William Fairfax, his grand manor on the Potomac, as he had years before given his vast estates in England to his brother. To me there is something pathetic in his retiring step by step from the world, the habits, the companions and kinsmen of his youth, until in his lonely old age this generous hearted sportsman buried himself in the wilderness. He was no moody misanthrope, nor ascetic hermit practicing a repellant philosophy, but seemed to have fathomed the frivolities of life, and as he grew older found true happiness in simplest pleasures. His experiences with the painted beauties of King George's court in his youth seemed to have sufficed for him the rest of his life, and I shrewdly suspect that the female members of William Fairfax's family, who resided with him at Belvoir, may have had something to do with the old bachelor's abandoning that manor and taking to the woods. Certain it is that none of the sex ever came to his last retreat, Greenway Court, which was an Eveless Eden.

It was still standing in Washington Irving's time, who has described it as a long stone building one story in height, with dormer windows, two belfries, immense chimneys, studded with swallow and marten coops, and a roof sloping down in the old Virginia fashion into low projecting eaves that formed a veranda the whole length of the house—a typical fox hunter's retreat. About the knoll were outhouses for his numerous servants, black and white, with stables for his hunters, and kennels for his hounds. It was in the center of a beautifully kept park of ten thousand acres. Irving has recorded as an instance of his eccentricity that he never slept in the main house, but lodged apart in a small wooden cottage containing a single bedroom. According to the tradition, I have heard there never was room for Lord Fairfax in his own house, which was given up to his guests. The fame of his hospitality and sportsmanship gathered about him the sport loving gentry of old Virginia, who not only found pleasure with him in the field, but instruction and improvement as well in the society and conversation of a man of literary taste and culture who had mingled in the best society and associated with the most learned intellects of Europe. He had brought his books with him into the wilderness, and from Washington's diary we find that it was here, in the interludes of fox hunting, he read the history of England and the "Spectator." Indians, half-breeds and leather-clad woodsmen loitered about Greenway Court, and shared its hospitality with the stately gentry, the whole combining to form a picture of baronial state that we find some difficulty in reconciling with democratic America. Although occupying pretty much the position of a feudal lord, a greater benefactor to his people never lived than this old fox hunter. His kinsmen were not the only sharers of his generosity, but many a rich estate in the Shenandoah Valley to-day can be traced back to a gift from Lord Fairfax to some poor and deserving settler.

The famous watering place of Bath, with its medicinal springs, was his present to the people. He devoted his time and money to building roads and other public improvements. He led a peaceful, happy, beneficial life and took no part in the little competitions, factions and debates of mankind, either in politics, or war. Consequently the historian has done his whole duty by Lord Fairfax in a three-line notice that he once existed, and was "eccentric." What a commentary! If to triumph over the temptations of wealth and position, to be pure and simple in heart, noble in thought, and unselfish, indeed be eccentric, then I will admit his eccentricity, and love him for it, as indeed did every one with whom he came in contact, from old Peter, whom he abused for his incompetency in the field, but pampered and put up with, to George Washington, the Father of his Country, who received from him his start in life. I have no doubt that the wits and Beau Brummels of the London coffee houses, the very brother to whom he had given his English estates, were equally convinced of his eccentricity, and I suspect there are some utilitarians of to-day who would find his passion for fox hunting proof of eccentricity, but the sport loving Virginians of the last century took to the new sport with eager avidity and with a pack recruited from his kennels set up for themselves all over the Old Dominion.

Blueskin, who was at the head of Lord Fairfax's kennels, was the progenitor of them all, and the prepotency of his blood is apparent even to this day in the pure old strain of Virginia fox hounds, whose distinguishing characteristic in color is blue ticked. Many years after old Buckskin had gone the way of all flesh, Washington had a horse and a hound, both named after the old dog. His registers containing the names, ages, and marks of his horses and hounds are still preserved at Mount Vernon. From his diary we find that he procured a pack shortly after marrying the widow Custis, and settling down to live at Mount Vernon. To me there is something delightful and relieving, after gazing up at the lofty pedestal upon which the apotheosized Washington has been placed by the historians, to turn over these musty manuscripts and find he was just a plain, every-day fox hunter who had the same triumphs and defeats, the same joys and sorrows in the field that we ordinary mortals have. I wish he had not been so brief in his diary. I find that Lord Fairfax, who was then seventy years old, was his most frequent companion in the chase. How I wish he had written the full details of that week in November when Lord Fairfax came to hunt with him at Mount Vernon; but I suppose he did not have much time for writing. He recites how he and Lord Fairfax and Mr. Grayson and Phil Alexander and Mr. Wilson and Young Bryan Fairfax, who, upon the death of his lordship's brother in England, without heirs, became the eighth Lord Fairfax, went hunting on Nov. 25 and "catched a fox." They were hearty four-bottle fellows in those days, and if a fox hunter after a hard day afield is a little drowsy, and loose in grammar in his private diary, I love him all the more for it. I know he is a sportsman, and that entry was never intended to be read by tea drinking old maids. The entry of Nov. 26 is even briefer, and I fear they did not "catched a fox," or if they did, his recollection was rather hazy when he came to post his diary as was his invariable custom before tumbling into bed, as the entry on that day and the four subsequent days simply recite the fact that he was hunting with the same company. I'll wager that when the company departed at the end of the week there were many empties among the thirty-five dozen bottles he mentions having bottled some time before. And if young Bryan Fairfax endeavored to hold his own in that seasoned company, I'll bet the butler knew how he got to bed better than he did himself.

Upon the breaking out of the French and Indian war, Braddock, the bon vivant, who had come out from London to exterminate the savages, visited his old friend at Greenway Court, and it was to Lord Fairfax's recommendation that Washington was indebted for his commission in that campaign. We all know how much better it had been for Braddock had he paid more attention to that recommendation, and placed more reliance on the young soldier's advice. Braddock's death and defeat are a matter of history. The back settlements of Virginia lay at the mercy of the marauding savages. Murder and rapine stalked through the land. Several settlers in the Shenandoah Valley fell beneath the tomahawk, and the rest prepared to fly. The friends of Lord Fairfax, fearing for his safety, urged him to retire to the lower settlements. Greenway Court was a tempting prize for plunder, and he was considered by the Indians a great chief whose scalp would be a fine trophy. But the high-spirited old nobleman determined to stand by his home in the wilderness. To all his friends' entreaties he replied:

"I am an old man, and it is of little importance whether I fall by the tomahawk or die by the infirmities of old age."

His courageous example was of inestimable influence. The panic stricken hunters and settlers rallied round him. Militia companies were formed, and the marauding bands driven back, and the beautiful Shenandoah Valley which he had been at such pains and cost to settle, was saved by the old fox hunter's bold stand from the torch and scalping knife.

Time ran on in sun and shade, and the octogenarian sportsman peacefully drifted down the tide of time, his heart and hand and purse ever open to the unfortunate. The Revolution broke out, and his young friends in whose society he had renewed his own youth, saddled their hunters, and let loose the dogs of war, some on one side, some on the other. But to the old man the fiercest thunders of the conflict were but as the distant rumble of a passing shower on the far horizon of a summer day. So well was he beloved that his retirement was respected by all, and his privacy never disturbed by either side. In the midst of war his sands of life ran out in peace. Thomas, the sixth Baron Fairfax of Cameron, born a British nobleman, 1690, died at Greenway Court an American citizen, 1782.

FRANCIS J. HAGAN.

Men We Sometimes Meet.

I.

THE man who reasons, I don't see any fun in it myself, therefore it is not really and truly sport.

Natural History.

Things that Creep and Crawl.

POLITICALLY life in Samoa is closely associated with that remarkable epic, "The Hunting of the Snark." I have had to watch aghast so much of the hunting of that mythical animal in daily terror lest it prove a boojum, which it always did, accompanied by the plaintive shrieks of the jub-jub bird and the moans of the frumious Bandersnatch, that my gristle rises at the familiar lines. But it is not only in diplomacy that the verse applies. In one of the fyttes of that sevenfold agony there is one simply and sweetly pathetic line, which applies:

"Then strange creepy creatures crawled out of their holes."

That's the domestic side of Samoan life—that's housekeeping in the islands, a never-ending war against the creepers and the crawlers.

"My word!" Dosie Gurr used to say in the Colonial dialect, for she was a New Zealander, "it's like tiking a blooming course in zoology to live here." That's English as she is spoke by our Colonial cousins. "Ask the lidy if she'll tike a piece of cike" is Australian English, hard to understand until you get used to it. Dosie Gurr was right in this. I never knew whether I was living in what was really the best house in Samoa or was an inmate of a zoological garden.

To appreciate the situation it is needful to know something of the house in Vaiala—"the maota in the malae of Lelepa," as I had to describe it in all Samoan letters. There were inner arrangements for sleeping and for the transaction of the Consul-General's official business, which seemed to consist mainly in smoking vast quantities of native tobacco in banana leaf cheroots and in ceremonious drinking of the harmless but soapsuddy-looking kava in the effort to match one set of native intrigue against the other. All told, these needs used up less than half of the space under roof. The better two-thirds was veranda, on which the daily and synodic travel of the sun left drifting areas of charming shade. A section of veranda, impermanently latticed off like the Hawaiian lanais, made the dining room, and most of the zoological research was conducted in that segment of the domestic economy, for natural history and meals together are bound to make an impression.

From the beginning I was told not to walk on certain portions of the veranda because of the ants. Tonga used to call out after me, "Ta fefe i loi ma loata!" I don't like ants in my sugar bowl, but I never was afraid of them, as my maid's words would seem to imply in warning. Because it was the country custom, I had the legs of the dining table and the meat safe set in empty beef tins of corrosive sublimate, which it was the cook boy's duty to replenish every Monday morning. That offered some prospect of keeping the ants out of the butter until they had triangulated the range of the table with an insect wisdom in geodesy, after which it was easy for them to climb on the ceiling to the exact spot which would allow them to tumble in the half-melted butter with which one must oil the food in an iceless tropical habitation. Wise birds, these ants, when it comes to getting in the way of dining humanity. But Tonga's warning meant more than that. Tonga was not at all fastidious as to this or any other combination of dinner and zoology. She had in mind to warn me against a more serious inroad. What that was I soon found out. She had shouted to me to look out for ants in a certain spot of the flooring, and I had disregarded the warning, because I had not yet learned to fear the tiny ant. All of a sudden the flooring vanished beneath my step, and instead of finding a place to walk on, there was a yawning gap in the planking. Then I knew what was meant. The ants are not only after butter and such things to eat—they go for house timbers and riddle the planks. It is often the case that they will cut out a board from end to end and leave no outward sign, for they never touch paint. When you are least expecting it the solid plank is really but a hollow sham, which the least pressure will break through. In any boarded house in Samoa that is over five years old, it is just as easy to walk out through the wall anywhere as it is at the door, and that the ants have done. Tonga's caution meant: "I'm afraid of the loi and the loata." Except for the slight and graduated difference in size, it was not possible to distinguish between the loi and loata, both being common house ants. Both were red and both were minute, and one was as destructive as the other, neither being as large as the common red ant of America. Although they eat your house out from under you they render good service as scavengers. I have seen cases where a dead rat was reduced to shining and harmless bones in less than an hour by the well-directed efforts of these inconspicuous cleaners.

After a long residence in New York, I felt on terms of intimate acquaintance with cockroaches, as I erroneously named the common water bug. The stories of South Sea travelers that they had been forced to sink their vessels to rid them of the pest I viewed with complacent appreciation of their skill in mendacity. But after I came to know the real cockroach, the *Blatta orientalis*, I was convinced that these stories were mild—if they had mentioned a ton of dynamite I should have believed it too mild a remedy to be effectual. One day I was called on to open the locker in which the tinned provisions were kept, for I never had a Samoan visitor who could not dispose of a pound can of corned beef or salmon while waiting for the cook boy to prepare him something to eat. On the inner side of the door was the slough of a cockroach about an inch and a half long, and alongside of it was a cream-colored monster all of 3 inches in length. It looked buggy, but it was a new thing in my experience, and I called for some one to explain the mystery. The cook boy came running up, and as soon as he saw what was the trouble he looked on me with scorn. Mitaele regarded the other member of the household as his official superior, and was apt to treat me with scant courtesy, after the manner of each of the craft of our native servants, who refused to consider other than their specific duties. Mitaele's duty was to cook, and as cockroaches were not cookable he felt that he had unnecessarily been called from his proper duties. However, he explained: "O le mongamoga mate lenei, ua ola lea."

"This is a dead cockroach," he said, pointing to the slough, "and that is a live one." It was a marvel to see how big the bug was in comparison with the shell which it had just discarded as it lay torpid and waiting for the new skin to harden. I became better acquainted with the brutes and learned to recognize their nocturnal inroads on my fingers. After I had lost a few pairs of shoes through their nibbling at the seams, I soon recognized that they were more of a pest than I had considered possible.

Twice a year we had flies in abundance. For months they vanished from human sight; but as soon as the bread fruit came into blossom we were pestered with them. They flocked in such crowds that I appreciated why the outward mark of all Samoan dignitaries is a fly-flapper of horse hair or fiber. The Samoan habit exposes so much skin that it is easy to see that life would be a torment without a sharp brush to get rid of the pests. The junior member of my family hated flies. If his hatred only extends to the Prince of Flies in the same measure his hereafter is sure. He brushed them away and still they came and kept a-coming. But he was not to be downed. At one of the stores he found a wire trap, which was to be baited with sugar and vinegar. To this he pinned his faith and set it on the dining table in the lanai. Of course, as the place was open to the air in every direction, he might just as well have set it on a post in the village green for all the good it did. When this fact was called to his attention and it was argued to his satisfaction and disgust that he had undertaken a contract to kill all the flies in Samoa, he grew wildly angry and kicked the trap into the sea, whence it was washed up on the next tide chockablock with long-armed fighting crabs, so that he had the satisfaction of catching something, any way. But this annoyance visited us only for two months in the year—once in what should have been the spring and once in what should have been the autumn if the torrid zone had been equipped with those seasons, but always when the bread fruit was flowering.

From flies to mosquitoes is an easy transition. The old Samoan legend runs somewhat after the fashion of Pandora's box and tells how a Samoan girl was impelled through curiosity to split open two bamboo tubes, of which one discharged a cargo of flies and the other let loose the first mosquitoes on the the islands. They are fierce birds, these mosquitoes. By day they are hidden from the sight of man; at night they are a consuming pest. Yet there is one good feature about them—they will not come near a light, a habit which they do not share with the Jersey brand. Even the moonlight is sufficient to keep them off, so that for at least a part of the month it was possible to enjoy the delights of the cool night air on the broad veranda. Within doors they kept away from the light of the lamp, yet there was no way of sitting at a table in comfort, except by putting a lighted candle on the floor to drive them off.

Still, if the lamplight kept off the mosquitoes it attracted swarms of other bugs. There were soft and pudgy moths which buzed about in a bewildering fashion and attracted flocks of vampires which hovered in the shafts of light seeking their prey. The most common of these evening flyers were black coleoptera about a quarter of an inch long, which came by the million. Drawn by the rays from the lamps, they seemed possessed of an insane desire to fly down the lamp chimneys. Every now and then the room would be filled with nauseating fumes of cooking beetles, and the flame would be choked out by the mixed mass of carcasses, which would have to be cleaned out amid the deadly assaults of the mosquitoes, which had been waiting for just such an opportunity.

A rare and always interesting insect novelty were the phasmidæ. It sometimes happened that one would watch the flight of a long and heavy fly headed directly at the climbing stephanotis or the shrubs of frangipanni. The eye might have noted the place of coming to rest, but as soon as the flight was ended the insect seemed to vanish, for the most careful search was unable to disclose anything but dead twigs. It was one of the stick insects and a fine example of protective mimicry. An even better example was the less rarely seen leaf insect. I have been able to see but few of these at rest. It has happened that I have watched them in flight and have waited eagerly to note the place in which they would land in order to get a better view of the mimicry. At distances of from 15 to 20 feet the insects have taken alarm, the leaflike wings have ceased to beat and have remained outstretched. Stopping in its flight, the insect has slowly fluttered to the ground, and it has been impossible to recognize it in the grass, so deceptive was its resemblance to the tender twigs of the ylang-ylang.

In the chronic revolutions of Samoan politics I knew a man who had no hesitation in going unarmed among the troops of the Samoan rebels, and the Malietoa forces were just as bad. He was able to send budding rebellion back home again, and never seemed to think that he had been in any personal danger. But he was scared to death of the Samoan spiders, although they are all as innocent as so many guinea pigs. One spider that ran over the houses at all times and everywhere was as good as a circus. It was a light-colored beast, about a quarter of an inch long. It built no nest or web, but was a hunter pure and simple. Its mode of capture was to stalk the flies when they came to rest on the walls. It would begin its hunting on a fly a yard or more away, and would slowly creep up on its victim with a nervous quiver that showed plainly the delight which the animal took in its game. At the distance of rather less than a foot the spide would collect itself for the final rush and remain all in a tremble of excitement. When the fly turned its head away the spider would leap through the air, and seldom failed to catch the fly. It would puzzle any student to know how it was done, but I have seen these hunting spiders in a leap of a foot directly upward clear with ease an obstacle more than 2 inches high, and in the last of its flight swerve as much as 3 inches to one side to allow for movement of the fly after the spring had begun. Theoretically, the thing violates every known rule of mechanics, but so did the curve in pitching a baseball when the college professors first began to study that paradox. The largest spider, and it is a very common one in Samoa, is a gangling legged monster that can hardly be covered by an ordinary saucer. It is smooth all over, the accident of having it fall on my hands having shown me that it is as smooth as velvet; the eyes are closely grouped together, and in the sunlight blaze like gems, and in the dark there is a glitter from them that seems to show a phosphorescent action of some sort. This spider looks bad, but it is perfectly harmless for all its grim appearance—in fact, the Samoan children play with them. It also spins no web. There are web spiders, all nocturnal, but I have never seen them. Their cords are often found stretched across the paths, and are tough enough to pull off the hat of the passer.

Popular ideas credit all the tropics with the scorpion. There are plenty in Samoa—little fellows about an inch long, and they may be found by rolling over any log or stone. They seldom sting, and when they do the wound is not so bad as the sting of the mosquito. They abound in all boarded houses, but owing to their shy habits and nocturnal disposition they are seldom seen, and their only trace is the discovery of their slough, with the sting curled up in a menacing attitude.

The centipede is very common—a dreaded neighbor. Charles Warren Stoddard has written of it as a disconnected chain of unpleasant circumstances. They are so numerous that it is never safe to thrust one's hand into the thatch of a Samoan house at any time. It is not uncommon for them to drop from the roofs of these houses to the floor in the midst of some of the evening deliberations of the native politicians. They hold the "atualoa,"—the "long god"—in great fear, and such deliberations invariably adjourn until sure that the centipede has been destroyed. The sting is painful at the time and for days afterward; but it is in no sense dangerous. These centipedes frequently exceed a foot in length, with each of the twenty-one segments as large as a nickel.

No house is ever free from the "unga" or hermit crabs, which make a feasome racket at night as they carry their topheavy borrowed shells into all sorts of places where it was not meant that they should go. There seem to be two distinct classes of them. For one class the limit of size seems to be the small univalve shell not bigger around than a shilling. In these the two claws are very nearly of the same size. The large hermits are a dozen times as big; the claws are disproportionate, and the larger can give a very sharp nip—one that the incautious meddler will not be likely to forget so long as the finger remains black and blue. They serve a useful end in domestic affairs, for they seek out and destroy the eggs of countless insect pests.

Concerning the rats, known indifferently as "imoa," "isumu" and "iole," I shall not write now in this summation, for my friend Talolo introduced me to them as a game bird, and the account of our hunting and the pleasure of eating the catch will serve well for an article by itself. Still, I may mention that the imoa gave me my first chance to be real funny in Samoan.

I said to Tonga as she sat sewing by my side one day while I was studying out sentences in the language of the country, "Ua 'ai Samoa moa ma imoa."

"Moi!" replied my maid, stopping to light her seventy-second cigarette for that day; "that's so. I think so Samoa people she eat hen and eat rat. Samoa people fool people—never been circus and Chicago, except me."

It had struck me as funny, that collocation of Samoans and moa hens and imoa rats. But I learned in time that Samoan is tongue you cannot joke in. When you say a thing it is either the truth, which is contrary to the custom of the country, or else it is a lie and therefore a work of art; but a jest is impossible.

The bush is full of blue lizards—the pili. Every house is fairly alive with a smaller lizard—the mo'o—which is one of the geckoes with leaflike toes. They are little fellows, about 2 inches long, prettily colored in a light and a dark shade of brown. They can run up a glass window pane quite as safely as the flies, on which they feed. They are very tame, and will run up the hand when stretched out toward them, and a sharp ear can catch their little cheeping cry when they are content with their surroundings. But when alarmed they are off like a flash of light, and will take the most reckless leaps. I have seen them land safely at the end of a 20-foot jump. Yet when cornered they have no hesitation about snapping off the most of their tails. That was a maddening puzzle to my small cat. The sight of a mo'o anywhere was an immediate challenge to the kitten. She would immediately start on the hunt, for the most part a fruitless chase, for the little lizards could scuttle off faster than two cats. Yet when the kitten did succeed in landing on the lizard there followed a scene of bewilderment. The mo'o invariably snapped off its tail, which was left wriggling in one part of the veranada, while the lizard ran off to a short distance and awaited developments. The kitten never failed to be puzzled by the remarkable circumstance—she never knew whether to catch the lizard or the tail. If the mo'o moved the kitten went for it; but it always stopped short to keep an eye on the wriggles of the tail. As soon as she turned back to take care of the tail the mo'o got in motion and had to be looked after. Hundreds of times I have watched the dilemma, and the ending was always the same—the lizard got away and the kitten had to be content with the bony tail. But there were lots of lizards about my house sprouting new tails.

LLEWELLA PIERCE CHURCHILL.

The Panther's Scream.

Editor Forest and Stream:

In support of your assertion that the panther does scream, I offer the fact that in his early life in Vermont my father repeatedly heard the scream under circumstances that made it unmistakable. He also knew others who had the same experience. He also knew several well authenticated instances of the panther attacking human beings—some of these occurred in the day time. Undoubtedly the panther is less likely to attack a man than formerly—with him as with us, greater contact with man is likely to produce greater caution; but still he is not a beast to be trifled with. And when I read the statement of some writers that they never heard of an instance of attack on a man by a panther, I felt like exclaiming, "Where have you been all summer?" Horseflesh lacerated by the panther's claws when springing at the rider and the riders' torn clothes attested one instance in the adjoining town, and others that my father knew of were equally well authenticated. JUVENAL.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

Communication Among Animals.

IN "The Trail of the Sandhill Stag" Mr. Thompson several times intimates the fact of well understood communication between the various denizens of the woods. Some years of experience leaves no doubt in my mind that such is the fact.

A bluejay convention which I attended last summer is a case in point. In the early part of the hunting season I had gone to a favorite place to watch for deer. One or two jays discovered me one morning soon after I took my silent position. They made a loud outcry, and soon the jays were coming from all directions and the air was full of their varied and discordant notes. Then, as in a political convention, when many try to get the floor at the same time and motions and points of order give the chairman a hard time, and speakers a harder time to say their little say, the assembled birds clamorously contended for their opinions. After a noisy debate of almost ten minutes, it semed to me I could hear the making of a motion, its putting by the chairman, a full vote upon the question, the announcement by the chairman, and an adjournment took place as immediate, orderly and effective as need be anywhere. The members of the convention departed as swiftly as they came and less noisily, and within three minutes the woods were as silent as though it had not been. I was much interested and amused, for I never saw anything of the kind so ridiculously near human speech and action. It had its effect. Not a deer disturbed my reverie all that forenoon. But this was not all. During the afternoon the subject was more fully illustrated by a note of warning. I was perched in a tree on the shore of a pond. Opposite was a hillside, and numerous deer trails wound down the slope and centered at the pond. The sharp crack of a stick arrested my attention, and for several minutes my hopes were raised by the gradual but unmistakable approach of a deer. He was quite a distance off, but was surely coming. He did come, nearer, nearer, and I began to feel almost sure of a shot, when suddenly the shrill note of warning from a hitherto silent bluejay stopped the approach, and I neither saw the deer nor heard him more. Did I shoot the jay? I felt like it, but he did not show himself; and then I reflected that probably he had merely obeyed the behest of the morning's convention, and deserved to live for his fidelity. On the whole the day was full of interest and I thoroughly enjoyed it, although I got no deer. Does not life often present parallels of experience, when the defeat of cherished plans is more than compensated for by other things, if we but avail ourselves of them?

JUVENAL.

Eagles and Infants.

IN comment upon our recent note on the stories of eagles carrying off children, Mr. C. J. Cornish, of the London Zoo, sends us some notes from his article in the December Cornhill which bear on the subject:

Most people must have felt doubts as to the stories of eagles attacking men, even when their nests were being robbed. But an instance of such an attack occurred not long ago to Mr. Turner-Turner, a well-known sportsman and amateur fur hunter, in British Columbia. Seeing an eagle in the distance, he stood still to watch it, as he had not seen one in the neighborhood where he was shooting. "The ground was covered with 6 inches of snow, except on the summits of the mountains, where it was deeper," writes Mr. Turner-Turner, "and I was therefore a conspicuous object. Presently I was surprised to see how close the bird was approaching, but concluded that it must have mistaken me standing still for a stump, and would immediately discover its error. It never deviated from its course or changed its position, except to drop its legs slightly when about 10 yards off, and in line with my head. These it quickly drew up again, flying directly at my face, which so took me by surprise as to leave me hardly time to throw up my rifle as a guard, and to wave my left hand. This caused the eagle to pass above me with the rush of half a dozen rockets. Up to this time the thought of harming the bird never occurred to me. But I then faced about and fired at my retreating foe. Then with a rapid wheel it turned to renew the attack, this time making an undoubted and intentional swoop at my head, in which it would have been successful had I not suddenly ducked. It was not a common bald eagle, but, as I afterwards learnt, a mountain or golden eagle."

The stories of infants carried off in the Alps by large raptors have been wrongly attributed to the lammergeyer, and in all probability the golden eagle was the culprit, as the lammergeyer is not particularly bold, and mainly feeds on bones and carrion. But it was also stated that the lammergeyer had such weak, vulturine claws, "like a turkey's," that it could not carry a heavy weight at all. I had sufficient remembrances of the curved talons of a fine lammergeyer at Amsterdam to doubt this, writes Mr. Cornish. There is nothing like seeing things for one's self, so I did some kidnapping on my own account by stealing a little girl's largest and favorite doll, bigger than "a long-clothes baby," and had it dressed in the complete clothes of a child of a year old, fastened a 7-pound weight to its waist, which brought it up well over 8 pounds—that being about the weight of a six weeks' old baby—and asked permission to look at some lammergeyers' skins in a collection which contained specimens from all parts of Europe and Asia.

I was shown several drawers full of the dried skins of the great gypætus or "vulture" eagle obtained in different mountain ranges from the Pyrenees to the Himalayas. Needless to say, I chose a big one—a bird from the Himalayas, with very large talons, and taking out the "baby" from the bag I forced open the contracted foot, pushed the front and back talons through the infant's clothes at its waist, and allowed the other claws to close on and catch where they liked. Taking hold of the shank of the leg so that the skin might not tear, I found that the claws of one foot of a dead and dried lammergeyer were sharp enough and curved enough to hold up the clothes and 8-pound dummy of a baby. This shows how greatly the offensive equipment of a species may be underestimated.

Last month a story widely published in the French press gave a circumstantial account of the carrying off

of an infant by an eagle in the mountains near Nice. Why any one should doubt that a golden eagle could lift an infant is difficult to say. Their common food is the mountain hare, which weighs from 6 pounds to 6½ pounds, and one has been seen in the Island of Reay carrying one of these at a great height from the ground, while mobbed by carrion crows. They can also carry a brown hare, the weight of which is 7½ pounds.

There is at the present moment at the Natural History Museum a model of the skull of an eagle so gigantic that the imagination can scarcely fit it into the life of this planet at all.

The whole head is larger than that of an ox, and the beak resembles a pair of hydraulic shears. Unlike most of the giant beasts, this eagle, which inhabited Patagonia, appears from its remains to have differed little in form from the existing species. Its size alone distinguishes it. The quills of the feathers which bore this awful raptor through the air must have been as thick as a walking stick and the webs as wide as oar blades. It could have killed and torn to pieces creatures as large as a bison, and whirled up into the sky and dropped upon the rocks the gigantic carapaced animals of prehistoric Patagonia as easily as a modern eagle of California does the land tortoises on which it feeds.

A Rather Aquatic Hog.

Editor Forest and Stream:

Mr. H. B. Griffith, of Tornado, W. Va., a man who bears the best of reputation for truthfulness, related to me the following story:

"One day as my companion and I were baiting a trout line on Cold River, I saw something moving in the water about 30 yards from us, but owing to poor eyesight I could not make out what it was. I called my partner's attention to it, but his sight being also defective, he was unable to inform me. I quickly put on my glasses and saw it was a sow with a pig on her back which she was ferrying across the river. As she neared the shore, the pig slid off its mother's back and reached the land first, when it turned and faced its mamma, as if to say, 'I beat you out.'

"We told some of our neighbors what we had seen; but they said it was not news to them, as they had seen the performance of the hogs. Then I concluded to watch them, and was soon rewarded by seeing a repetition of their aquatic feat. The old hog would wade from shore until her back was nearly covered, stop and wait for piggy, which was prompt to accept the offer by immediately mounting the animated ferryboat. The sow and pig had been transferred from one side of the river to the other, and either the sow's inhabitiveness or its desire for the food it had had while on the opposite side, awakened in her the instinct to swim the river. A Mr. Pickens, who last owned the hogs, endeavored to keep them from the water with his dogs, but with the usual porcine 'contrariness' they would plunge into the river, in which case the pig would seize the mother's ear and thus be towed safely to the opposite shore." N. D. Elting.

Game Bag and Gun.

The Moose Country of Maine.

And for one the lakeside vigil where the bull moose leads the cow,
* * * * * * * * * * *
Who hath smelt wood-smoke at twilght? Who hath heard the birch bark burning?
Who is quick to read the noises of the night?
Let him follow with the others, for the young men's feet are turning
To the camps of proved desire and known delight!
—Rudyard Kipling.

Last September I determined to take a hunting trip to Maine for a bull moose, as soon as the season should open. As I had not hunted in Maine for more than twenty years I knew not exactly where to go, nor to whom to apply for information respecting favorable districts and good guides. After unsuccessfully trying several of my friends, from whom I hoped to get the desired information, the idea occurred to me to write Mr. S. L. Crosby, the well-known taxidermist of Bangor. It seemed reasonable to expect that he was, of all others, the one particularly interested in the shipment out of the woods of fine game heads, and that he naturally knew where these had been procured in previous years, and that he probably could, if he cared to do so, recommend to a sportsman the most likely places to visit. Although a stranger to Mr. Crosby, he was kind enough to send me a courteous reply, and he advised me to go to Nesowadnehunk Lake (pronounced by the natives Sow-day-hunk), and at the same time he highly recommended as guides Luther Hall, Jr., and William A. McLain, who own the camp at the lake.

Accordingly, just before the open season for moose in October I left New York with a friend and sporting companion, en route for Nesowadnehunk Lake, having previously made all arrangements by letters and telegraph for our guides.

Our start was from Patten, a town on a branch of the Bangor & Aroostook R. R., where our guides met us by appointment. Here we procured such necessary supplies as we lacked from the excellent stores in town, and might have procured our whole outfit had we cared to leave its purchase until we reached this point. A fifty-two-mile drive in buckboards is necessary over about the roughest road in the whole of Maine before Nesowadnehunk Lake is reached from Patten. This drive takes two days. Much of the distance cannot be made at a faster rate than two miles an hour. But when the lake is reached the sportsman will be well repaid for his pains, for he will find there a most luxurious camp, supplied with unexpected comforts, and he will soon learn to his satisfaction that he is in the heart of the moose country.

Nesowadnehunk Lake is situated north and a little west of Mt. Katahdin, and is located upon the ridgepole of the watershed of Maine. Its own waters run south into the west branch of the Penobscot River. Two miles north of the lake the waters drain into the east branch of the Penobscot, while about four miles north and west begins the slope from which the waters flow northward and empty into the St. John's River.

The lake itself is a beautiful sheet of water fed by springs, and is filled with speckled trout. There are only two kinds of fish in the lake, the brook trout (*Salvelinus fontinalis*) and a small fish which serves for its food. The trout are singularly regular in size, averaging about a pound in weight, yet some have been caught, it is said, weighing over 3 pounds. Although in October they are on their spawning beds, and may not lawfully be caught, yet we were informed that they will rise freely to the fly at all seasons of the year when the lake is open, and that they are fished for most successfully with any red fly. It was an easy matter to catch them in the hands, and I saw many fine trout so caught, but only for experiment, and for the incident's sake, however, and these were immediately returned to the water. One of the Maine game wardens, Capt. Pollard, whom we met in the camp, informed us that in his opinion this lake contained the best trout fishing in the whole of Maine. But all this is incidental; I did not start out to tell a fish story.

The game warden just above mentioned, a capital fellow and a good sportsman by the way, also informed us that he believed the country around Nesowadnehunk Lake to be the best moose country in Maine, and our subsequent experience convinced us that he had good reasons for this opinion. We were fifteen days in camp. During this time I personally saw seventeen moose in the woods, not reckoning those that were brought into camp by other sportsmen. Of these seventeen, only four were bulls, however. This disparity in the numbers of bulls as compared with the cows furnishes proof that the law of Maine prohibiting the killing of cow moose has accomplished the object aimed at, and has well preserved this game. The cows so far outnumber the bulls at the present time that it is much more difficult to "call" a moose than has been the case in previous years. This is particularly true in late October and November, when it is generally found that each bull is provided with a plurality of cows. The bull moose that we saw were young, and none had a particularly fine head. I do not mean to claim that there are no more splendid moose heads left in the Maine woods, but it is apparent that while the game laws serve as a whole to preserve the species, they work to the particular disadvantage of the old bulls, which are now the more eagerly hunted by the ardent sportsman; and possibly also to some future disadvantange of the race itself, because the species will not henceforth be increased necessarily through the survival of the fittest of the male animal. In former years, when the sexes were more nearly equal, the young bulls were driven from consort with the cows by their older and stronger brethren, but now every young bull is provided with at least a single mate, and some indeed have a following of two or three cows.

As for deer, they are plentiful enough. The first day we paddled about the lake we counted seven, and we saw deer every day, while altogether we saw some scores during our stay in the woods. But in October practically only does and fawns are in evidence, as the bucks conceal themselves in the swamps or on the hardwood ridges until the snow flies. After the first or second snow, the does and fawns seek the recesses of the thick woods, while the bucks then disclose themselves.

The sportsman who is willing to cheerfully undertake the hardships of the trip from Patten to Nesowadnehunk Lake during October or November may visit this section with the reasonable certainity of getting a shot at a bull moose, and he may also possibly do as one sportsman did while we were in camp, namely: In addition, get his lawful limit of deer, which is two, in the morning before breakfast. There were altogether eight or ten different sportsmen at the camp during some portion of our stay, and eight bull moose were shot. There were three who got their bull moose on the first day's hunting of the open season, including my friend Mr. Alfred Lauterbach, of New York, and I believe no one failed to get a fair shot at a bull. There was only one sportsman who denied when he left camp that his luck had given him the chance, but there were some reasons for believing he sincerely wished to forget one or two opportunities which he missed.

My object in writing this letter to Forest and Stream is to give such information to brother sportsmen as I would gladly have had myself when I first determined to go into the woods for a bull moose. Full particulars regarding this section of Maine may be had by any one who will write to Hall and McLain, at Patten, Me., or to John Jackman, at the same address. But let no one imagine that it is an easy trip to reach this hunting district. Its inaccessibility indeed has been the means of preserving it as perhaps the best moose country in the whole of Maine.

And now in conclusion I propose to relate two little incidents of our trip. One early morning I was being paddled about the lake, when my guide first discerned a mile or more away a moose wading in the water near the shore. We paddled as rapidly toward it as we could, hoping that it would prove to be a bull. It turned out to be a cow. We easily approached within 100 yards, when the moose stopped and examined us suspiciously. Presently she started off on a rapid trot in the water and along the shore. There was a meadow here, and before she might hide herself from sight in the woods she had to traverse an open space of quite 100 yards. Just where she reached the edge of the woods there was a big fallen tree, about 4 feet high. Upon this she jumped and trotted along it as lightly as a squirrel for 15 feet or more, and then she sprang off on the other side and disappeared in the thicket. That night at supper I told the story. We found that some of the guides were politely incredulous, but my own guide indorsed the accuracy of my statement. Now let me suggest that field glasses be not forgotten by him who goes into the woods to hunt moose, as happened in my case. There will be need of them every day. If we had had glasses we would have been saved on this particular occasion a long, hard paddle after a bull moose as we supposed, which on nearer approach proved to our disappointment to be a cow.

The second story regards a deer and its tail. Almost every night the camp was visited by deer, as was evident by their tracks in the morning. One moonlight night my friend Mr. Alfred Lauterbach sat up to shoot one from the window of our cabin. At 2 o'clock in the morning three deer duly appeared, and he shot the largest one and knocked it down, but it presently arose and bounded off. In the morning the trail was easily followed into the woods. At about 100 yards distance the trail led beneath a fallen tree trunk. The deer had chosen to crawl under the log, which was about 3 feet high, rather than to jump over it. This proved to be an error in judgment, and the deer thereby lost its tail, for on the further edge of the log was a sharp projecting knot, which caught the tail and tore it clean off. We found the tail, but we never got the deer, though it had been sorely wounded with a soft-nosed bullet from a Savage rifle.

Do you know the blackened timber—do you know that racing stream,
With the raw, right-angled log-jam at the end;
And the bar of sun-warmed shingle where a man may bask and dream,
To the click of sharp canoe-poles round the bend?
Is it there that we are going with our rods and reels and traces?
To a silent, smoky Indian that we know—
To a couch of new-pulled hemlock with the starlight on our faces,
For the red gods call us out, and we must go.
And we must go—go—go away from here!
On the other side the world we're overdue!
'Send, the road is clear before you when the spring-fret comes o'er you,
And the red gods call for you. —Rudyard Kipling.

W. N. Amory.

New York, Dec. 8.

On Snake Creek.

We had talked of an Indian Territory deer hunt all summer, and there were at least a round dozen that seemed eager to take part in it until the moment of starting arrived. On Dec. 1 W. W. McIlhaney, Brady Crowe and the writer "laid down our pens" and declared that "now is the accepted time," but we were alone, the other having "flunked."

The weather was pleasant but cool at the time of starting, and from the word received from our friend Harris, at Wagoner, I. T., we learned it was the prime season of the year for sport.

At 6 o'clock the next morning we were in Wagoner, and our friend was present to meet us, and when everything was taken care of he conducted us to his residence, where we sat down to an elegant breakfast. By 9 o'clock we were on the road, bound for Snake Creek, south of We-a-lac-ie Mission on the Arkansas River, in the Creek or Muskogee country. Our driver and cook was a negro, black as a rubber comb, named Bill Coe, but the gang soon shortened it to Calico, and by that name he is known to this day. Three months before he had strolled into Wagoner from a Red River plantation, where he had spent his entire life of forty-five years, in ignorance of the size or ways of the world, until this, his first departure, from the "reservation." He was the most amusingly ignorant specimen of the genus homo that we had ever met, and during the whole trip furnished us with good grub, good driving and an excellent show. He was as afraid of an Indian as he was of a blue gum nigger's voodoo bag, and he believed implicitly everything a white man said.

At late dinner we ferried the Verdigris and struck camp at sundown on the banks of the Arkansas at the Childers Ferry. A ferry boat was tied up to the bank near our camp, but we were not able to raise any one to operate it.

It was a slab affair, propelled by push poles, and seemed about as dangerous to tackle for a crossing as the quicksands themselves. No one could be found next morning to ferry us over, and although we knew nothing of the art of navigation, as applied to the push pole on the Arkansas, like the boy who dug for the ground hog, we needed meat and must cross. So, after a council of war, we decided to tackle the boat for a crossing. Calico's was the only dissenting vote. "Wot if dem Injuns wot owns dat boat injects to yo' takin' it?" he asked. "I didn't hire to youse to be skulped."

McIlhaney then asked him if he chose to take his chances of an Indian massacre or preferred to be killed and eaten by us. That settled him. He sullenly mounted his wagon and we were soon on the boat. When we pushed off the bottom was easily reached with the poles, but when we had reached the main current we found that our poles would not touch the bottom, and we lost control of the vessel. Round and round it whirled, and down the river we went at terrific speed, and the black face of Calico became ashy. Do what we could the down stream progress of the scow could not be checked, until finally it struck a sand bar with such force as to throw McIlhaney overboard, throw the balance of us flat, and scared what was left of Calico to death.

A mile stretch of sand and freezing cold water lay between us and the south shore. While we were working to get off the sand bar, an Indian, the owner of the boat, came along, and with his assistance and knowledge we soon got away and were landed all right. The Indian was a little out of humor, and his murderous looks and evident displeasure at the appropriation of his property set Calico to praying. We gave him a silver unit and thanked him and went on our way, while Calico fully made up his mind that we were hunting trouble and fast getting him into a scrape.

That night we put up permanent camp on the Snake at the junction of Duck Creek, and fixed ourselves for a two weeks' stay. Our tent was pitched on the north bank of and near to Snake Creek, and the team was "stabled" nearby.

Harris was so easily lost that his work was confined to quail and prairie chicken hunting near the camp. And there was plenty of the sport to be had. Calico was all the time bewailing his fate that brought him into "sich a owdacious" country, and insisted that something "bad was gwine to happen."

The next morning before it was light, we started out for game. It began a drizzly rain about 9 o'clock, and it certainly was an ideal still-hunting day.

Just before dark the three hunters reached camp and Crowe carried in a fat little yearling buck, while McIlhaney and I had a turkey each, and Calico for a time forgot his troubles. That night after supper, while sitting around the tent stove, Indian talk, for the benefit of the cook, was indulged in, and by the time we were ready to turn in his eyes were shining like door knobs, and every sound made him jump and shiver.

It continued alternately raining and snowing for the next ten days, and while it was a little unpleasant to be out in, it certainly was the best weather for successful hunting that any of us had experienced. Game of all kinds continued to accumulate, and by the 18th, when we had decided to start on our return, there were four whole deer and the remnants of a fifth, eleven turkeys and possibly two bushels of quail and prairie chicken in the stock.

The longer we remained, however, the more nervous became Calico, and he protested in his mild way against being left alone at the camp, for, said he, "What's I gwine do if dem Injuns comes? I cain't hit de woods wid a shotgun?"

Crowe suggested that he might "hit the road," but this was lost on the darky. They still talked "Injun, massacre and scalps" in Calico's presence, and that individual was in a state of terror all the time. One day Crowe, McIlhaney and the writer climbed up over the mountain to the west of the camp and hunted together. Late in the afternoon Crowe and McIlhaney jumped a fine large buck that ran directly toward me, and but two "barks" from my rifle were heard before the "killed hoot" brought the others to me to view and admire the finest specimen that had yet fallen to our party. It was nearing night, and there was good six miles between us and a much desired supper. Besides, the mountain down which we were compelled to go was very precipitous and rocky.

The deer was quickly prepared for transportation by removing the entrals and swinging it on a shoulder pole.

When we reached the little valley where camp was situated, it was pitch dark. We could hear some one hallooing and occasionally shooting on the opposite hill. When we came within a hundred yards of our camp we could outline by the dim firelight the form of Calico, sitting with a gun across his lap, and his head down, asleep. We laid the deer down, and Crowe and McIlhaney slipped up under the bank of the creek, and using care that nothing would be hurt by the shots, fired in the glowing coals with their rifles, at the same time yelling like savages. That darky was covered with coals and ashes, and at a low estimate he jumped 10 feet. We were so convulsed with laughter that we did not notice anything for a few moments, and when we did, could hear a horse's feet striking the rocks in the direction of the road up the hill. We carried the deer across the creek, and the first thing that was noticed was McIlhaney's new Smith gun lying in the fire where the cook had in his terror dropped it. Then Crowe looked at the team and found that Calico and one of the horses were missing. All at once it struck us that the joke was working both ways, and that Calico, to escape from the savages that he thought had attacked him, had escaped on one of the horses. We could yet hear that horse hitting the rocks a mile away. McIlhaney jumped on the remaining horse and followed the fugitive, and Crowe and I began getting camp in order for the night. Soon Harris came in. He it was that had been yelling and shooting. He had been lost, as usual, and his yelling and banging of his old muzzleloader had given Calico splendid preparation for the fright that possessed him when the Winchesters threw the coals and ashes over him. About 9 o'clock Mac and Calico came in, Mac mad and tired, the horses completely fagged out, and the negro with a well-defined case of heart disease. Calico, when he discovered that he was not hurt by the fire that he supposed the "Injuns" had aimed at him, jumped on Fox, the slowest horse of the team, and tried to escape. As Mac approached him and gained on him, I suppose the poor man died a thousand deaths. He realized that the pursuer would finally overtake him, as he could tell that he was gaining rapidly. When Mac came in hallooing distance of the darky, he yelled for him to stop. Calico's answer was a desperate kick at the ribs of old Fox and new efforts to increase his speed. Finally, Mac overtook the scared African, after old Fox had completely given out.

The poor fellow rolled off the horse and begged for his life, Mac hardly being able to get him to understand that he had been pursued by a friend instead of a "murdus Injun." This afterward furnished a laugh every time we thought of it, but that day when he started off with the horse, the smile seemed to have changed, and it was a feeling of anxiety that pervaded the camp until the return of the Red River refugee.

On the 18th we broke camp and started for home. It was rather cold, and during the first day it alternately rained and snowed, and when night set in it was a corker. We reached the Arkansas River about 4 o'clock in the afternoon, and got across just at dark. We concluded to drive to the Verdigris that night, but Harris, true to the record he had made on this trip, lost us, and we stayed all night in the cold and wet, and at daylight found we were twenty miles further away than we were at the Arkansas ferry. By hard driving we reached Wagoner that day in time for the homeward bound train. On the 20th we reached home, with plenty of game to give our friends a feast, and experience enough to entertain by its recital every sport lover in the city.

J. W. FARRELL.

WEIR CITY, Kan.

Have the Ducks Changed their Line?

PARKERSBURG, W. Va., Dec. 6.—*Editor Forest and Stream:* I have just returned from a ten days' trip to Cobb's Island after ducks. The birds are very scarce; only a few brant and geese; no black ducks worth speakinyg of. The gunners laid it to the wind and tides, but the fact is they are not there. Then I came up to the canvasback grounds, and there found nearly the same conditions. Have the ducks changed their flight?

C. L. S.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

CHICAGO AND THE WEST.

Shooting with the Saginaw Crowd.

CHICAGO, Ill., Nov. 18.—Every one who reads FOREST AND STREAM has been entertained and amused by the histories of the "Saginaw Crowd" which the leader of that assembly, Mr. W. B. Mershon, of Saginaw, Mich., has written of the divers wanderings of this party into all the corners of the Western world. Not everybody, however, may be aware of all the inner history of this peculiar "crowd." It is really one of the most remarkable associations of sportsmen to be found in the United States, nor indeed do I know of any which resembles it. Composed of a dozen or so of wealthy men residing in different cities of Michigan, Ohio and New York, this body of shooting and fishing enthusiasts has reversed the ordinary method of wealthy men in search of sport. The Saginaw Crowd has always stood for open shooting, and has never maintained a preserve. On the contrary, its steps have always turned naturally to the wildest portions of the wilderness. Its trips to the Yellowstone country, to the Indian Nations, to North Dakota, to the Bad Lands of Montana and other less frequented corners of the best shooting regions, have always been made by the "crowd" in a body. Years ago the "crowd" conceived that it would be pleasanter to have a special car of its own. The members clubbed together and bought a private car, and after using it a while the notion so took possession of them that they had another car built, a very palace on wheels, with all the conveniences of the best Pullman sleeper, and a thousand special contrivances for sporting comfort such as cannot be found on any other car in all the world, as I imagine. This car (which bears the fitting inscription "Wm. B. Mershon") has an interesting history, and it has had under its roof some of the rarest souls of all American sportingdom. It goes to Dawson and Dickinson, and Mexico and California. It goes over to the Kinne Creek Club house, where some of the members are stockholders, and it goes to the Au Sable and the Boardman, and the Pere Marquette, and to many other delectable localities, and now and again we hear of these journeys through the FOREST AND STREAM.

So much might be said of any party of men who had the tastes of sportsmen and the means to gratify their tastes, although I do not know of any such organized body of men outside of this one. But to say this would be not to mention the distinguishing peculiarity of the Saginaw Crowd, which sets it, I am confident, distinctly out of competition. The Saginaw Crowd has never held a kicker, never known a dissent, and never dwelt in anything but absolute and unaffected harmony. This is a record which we shall not see duplicated, in all probability, in any similar body of men throughout so long a term of years. Hence I consider this little body of sportsmen to be one of the most unique organizations in America, and its doings of a singular interest to all sportsmen, whether rich or less blessed with worldly stores.

When the Saginaw Crowd gets on its shooting clothes it is the hardest looking, hardest shooting, hardest walking and hardest eating crowd in the world, and every fellow there is a man and nothing more, and willing to accord that status to every other man, whether city shooter or of a sort which we sometimes call native. The Saginaw Crowd leaves no hard feelings behind the wheels of its special car. We read about the dukes, barons and princes of the Old World, but methinks that dukes who could not shoot would be about two for a quarter on that car, and a prince who had nothing but his crown in prospect could be bought and held for a rise by any one of the party.

Not to be of close communion, or too strict a sect, the Saginaw Crowd does not lock the car door against friends of the members, but now and then admits others in the company of this vehicle, whose purpose it is to hunt out the best of the wild open country left in America.

When some one or two of the Saginaw boys get uneasy and feel like going hunting or fishing, the word is passed over the telephone, a party is made up and the car is put into commission. By tacit consent the leadership in details is handed over to Mr. Mershon. In some way best known to himself all the supplies get into the car. Harry and Jake, the porter and cook, get into their white jackets, and on a few hours' notice the car rolls out to some new country and some additional history, perhaps of only a few days' duration, perhaps of several weeks'. Then there is the inevitable regret of having to get back to business, and the bemoanings of those who could not go. Brief or long, hurried or deliberate, the trips of the Saginaw Crowd are always interesting and usually eventful. I do not believe that anywhere in the country there can be found a higher type of sportsmanship than that which obtains in this aggregation, whose name is familiar, through years of association, with the readers of FOREST AND STREAM. Nor do I need add that I should value an invitation to join that unique and distinguished body more highly than I could any other summons. When you are with the Saginaw Crowd you are all right if you can walk and shoot, though you may have to walk a good deal and shoot a good deal to keep in the procession.

The above is preamble to one of the pleasantest little experiences I ever had, and I am sure the Saginaw Crowd will wish to have it shared with the FOREST AND STREAM family. It was Mr. Mershon, head conspirator of the band, who told me to come over and get in line with them this week for a quail and partridge shoot. Of course, I had the usual misgivings lest the world might not be able to get along without me while I was out hunting, but I reflected that there might be others in the party whose affairs were almost as big as mine, and hence I argued that I too might risk it. In consequence whereof a few letters, a telegram or so, a hurried slamming of old clothes into a still older pack bag, and a hurried departure last Monday night for Saginaw.

I could have got there had I been deaf, dumb and blind. I have often commented with wonder on the executive quality of Mr. Mershon's mind. It is he who distributes and districts the parties on a shooting trip, who tells each man where he left his gun and dog, who tells the cook what to have for dinner, and who without apparent effort notes everything that is going on and sees that it goes on smoothly. I presume this is why he handles two or three big businesses and still has time to be the best field shot I have ever hunted with, the best natural dog trainer and the most ardent lover of sport for sport's own sake. In a few brief and well chosen words, as the daily reporter has it, Mr. Mershon told me what train to take to Saginaw, by what road and by what points. He advised me that I would arrive in such and such a depot, at such and such an hour; that I was to take my breakfast there alone, as the hour would be very early; that I was then to find the car, which would be in the depot yards near by, to go aboard and make myself at home until the party reached the car for the start, which would be at 8:15 in the morning.

All this came about as ordained. I took the Chicago & Grand Trunk train out of Chicago at 8:30 in the evening, and following copy did not go by Durand, but by Flint, arriving in the F. & P. M. depot at 6:20 in the morning. As I sat at breakfast in the dining room I saw a certain beaming and red-cheeked face, which I recognized to be that of Harry, the porter, who was out in search of me, and who advised me that I was to have breakfast on the car. It was too late for that, but we got my traps aboard, and in half an hour I was dressed in my shooting clothes and ready for trouble. The old car looked familiar, for this was my second journey with it. On the center table in the drawing room I recognized the big Regina music box which used to entertain us at Kinne Creek. I noted that it was set for a tune familiar to all good persons, that grand hymn which is named in the books "Adeste Fideles." I turned the crank of the box and the beautiful melody rolled out "How Firm a Foundation." This seemed to me a good way to open the day. so I sat down and had a good time until the faithful began to arrive. All at once there was a step in the rain puddles near the car, and there appeared at the steps the tall figure, the black moustache and dark eyes of the head conspirator, Mr. W. B. Mershon, or as his more familiar friends call him, Billy Mershon. With him was my old friend, black and tan Bob, one of the most sensible and level-headed meat dogs I ever knew. The black and white setter Queen was a new addition to Mr. Mershon's rolling stock. So far so good, and I thought I was a pretty lucky man.

As I was saying, Mr. Mershon met me in the depot at Saginaw just at breakfast time, and soon after his arrival others of the special car party began to put in their appearance. Of these were Watts S. Humphrey, the prominent Saginaw attorney, whose weight is somewhere between 200 and 300 pounds, but who can jump a five-barred gate with anybody. Mr. Humphreys brought along a handsome English setter with a wall eye and affectionate turn of mind. Mr. E. R. McCarty is another Saginaw heavyweight who stays out all day and comes in with full pockets in the evening. Mr. McCarty is using a setter now instead of the old pointer which he had on the day when I first shot with him, two years ago. Mr. E. N. Briggs is Mr. McCarty's old-time shooting companion, and this year is using an orange and white setter. Mr. Briggs is known in the Saginaw Crowd under the sobriquet of Little Wolf. Of slender physique and not in the best of health of late, Mr. Briggs retains all his old-time cunning with the shotgun and is always one to show results at the close of the day. Dr. E. N. Cross was one of the strangers in the city, if that could be said of one who was once a resident of Saginaw. Some twenty years ago Dr. Cross moved out to Stockton, Cal., where he is well known as a citizen and sportsman. He has at different times joined the Saginaw Crowd in their expeditions into Dakota and Montana, and is visiting in Saginaw this fall. Mr. George B. Morley is the same George Morley who used to beat us all trout fishing on Kinne Creek. Mr. Morley protested that he was a novice in quail shooting, but I noticed that he nearly always had feathers in his coat. His shooting companion was Mr. T. A. Harvey, another good sample of the Saginaw sort of citizen. Mr. Harvey has been shooting but two or three years, and did everything that could be asked of a man who is set to quail shooting with a close-choked, straight-stocked pigeon gun. Mr. Harvey admitted that he was a novice, but stated that he had done the best he could to get a good outfit. He had been sold all sorts of things, from a fyke net game bag to a patent cleaning rod, and he was a joy forever to everybody who wanted anything. Mr. George Morley and Mr. Harvey shot over Mr. Morley's dog, a very handsome English setter. Dr. E. R. Sumner, of Rochester, N. Y., joined the party on the third day, and is another one of those who have been out with the old car. Dr. Sumner, as we shall in due time observe, proved himself a sportsman and a shooter in every sense of the word. Among the last of the Saginaw contingent to arrive was Mr. Jack M. Morley, and without Jack Morley the party would have been incomplete. Dr. Sumner and Mr. Morley tied their faith to pointers, for their dogs. The oldest and most honored member of the entire party was Major Farnam Lyon, of the Bancroft House, in Saginaw. Major Lyon met us up the road, having just reached town from one hunt, and having made up his mind in ten minutes to join the car party for a few days more of sport. Major Lyon is certainly a sportsman worth mention. He is over seventy years of age, but does not appear to be over fifty, and is as active as a man much younger than that. I have stated that he had been out hunting for several days before joining us, yet he was out each day with us among the first, and kept going until dark. On the car he was as lively as the youngest, and was always among the last to go to bed. A better example of a sportsman in advanced years could not be found in all the country. He was the third of the party to use the pointer in preference to the setter. I speak thus fully in regard to the membership of our party because I consider it to have been a remarkable body of men. Knowing each other perfectly these gentlemen seemed fitted each for the others. With eight men and nine dogs aboard the car, we had a pretty good muster roll. Mr. Mershon was surprised to see that every one of the party was on hand in spite of the very rainy looking morning, all of which goes to show the thoroughbred quality of the aggregation.

Our destination was announced to be Grassmere, which is up north of Saginaw, on that strip of land which is known as the Thumb. Grassmere is the next station but one to the end of the road. The terminus is Bad Axe. Everybody in the world has heard of Bad Axe, though perhaps not everybody knows where it is. It lies about five miles from Grassmere, and Grassmere is about five miles from Bad Axe. And there you are. We ran north, parallel to the Saginaw Bay shore line, then the railroad for some reason changed its mind and went wandering off to the east, and finally it got tired and stopped, as above mentioned, at Bad Axe. We discovered the country to be partially farmed, the great industry being that of raising sugar beets, though we saw occasional stubble fields, and once in a while a strip of corn. Once this Saginaw Thumb was the wildest part of Michigan, and it is here that the last elk in Michigan were killed, as reported some years ago in these columns. Some of the heaviest pine forests of the State once grew here, and there are still large swamps and thickets where big game might live. The last deer in this part of the State, mentioned as being killed recently, was shot two years ago. Wild turkeys were seen ten years ago. This region in general resembles most of that slashed-over pine and hardwood country over which the more modern struggle at agriculture has been going on for the last score or so of years. The small game clings to such country in fairly good numbers, its abundance of course varying with the severity of the season.

We tumbled off the car at Grassmere at something like 10 o'clock in the morning. The clouds had broken away and the rain had ceased, so that we were after all favored with very decent shooting weather. Mr. Humphrey and Mr. McCarty started out in something the same line across country; Mr. Briggs and Dr. Cross paired off, and so did Mr. Harvey and Mr. George Moreley. Jack Moreley shot alone. Mr. Mershon and I went down the track a couple of miles with the departing train, which was obligingly stopped by Trainmaster Wallace for us. We found ourselves in a very good looking partridge country. I did not fancy it much for quail, yet the first game we made was a nice bevy of quail, which went up in a heavy popple thicket ahead of the dogs, without giving us any show for a shot. At the same time a cock partridge went up and sailed off unsaluted through the thick cover. Following on, the dogs located some of these scattered birds, and getting a close shot at a cross-flying bird, I stopped him for first blood, Mr. Mershon drawing a difficult twister, which he could not find. I then missed a long shot and killed another, which rose ahead of the dogs. We saw at once that we were going to have hard shooting, for the birds were very wild and unsettled on account of the storm. We lost a lot of time in the early part of the day working in this same bit of woods, but failed to do much with the scattered quail. Mr. Mershon was very much afraid that the new dog Queen would not turn out well, but after a while, when we struck in among the partridges, she surprised us very much by taking to these strange birds with perfect kindness, and indeed fairly beat the old veteran Bob in the number of points on partridges which she got during the day. As between the two, Bob acted like a perfect gentleman, but Queen seemed to have a very poor idea of the etiquette of the field. She would run in ahead of the old man when she saw him working out a partridge trail, and deliberately steal his point, to all of which he submitted with the best good humor in the world. A very wise and level-headed old dog is Bob, and we found him more comfortable to shoot over than Queen, for the latter was so fast she was continually running away and getting lost. One time Bob started down a little draw on what we thought was a partridge trail. I called him a little to one side to go after some quail which I heard whistling, and meantime Queen jumped in and pointed the partridge which Bob had been working out. Mr. Mershon killed this bird in handsome shape, and we went on after the quail. Once again Queen pointed, but the quail was in such heavy cover that Mr. Mershon failed to stop it. Still again we lost her, and after a long time found her pointing steady at the foot of a big stump. We came up carefully, one on each side of the stump, and at length Mr. Mershon said to me, "I can see it, and it is a partridge!" We were then not more than 8 or 10 feet from the bird, and as Mr. Mershon pointed at it it stood up with its crest erected as though it were angry. The next instant it burst up and away with terrific speed, and we both shot into it, so that nothing was left but a crumpled mass of feathers of what had been one of the proudest and strongest of game birds.

This happened at about 1 o'clock. Then we put up another bevy of quail, out of which Mr. Mershon got a bird, though the rise was in such cover that I did not get to shoot. We crossed the railroad now and got into some lovely looking partridge ground. Queen worked out an old cock a trifle fast, and I missed on a long rise. A few moments later Mr. Mershon killed a very long shot through heavy cover. He always takes any kind of a chance at a bird, and is the best partridge shot I was ever out with. He saw this bird go down and put in Bob at about the place he thought it fell. Bob took the trail, and at length found the bird nearly 200 yards away. It had come down wing-tipped, and the old dog brought it in alive and unhurt, a piece of work which added still more laurels to his reputation as a premier retriever. We now went about and headed toward home, and passing the edge of a little thicket a grouse sprang fully 30 yards ahead, and Mr. Mershon cut it down at the first shot, one of the prettiest snapshots I ever saw. Taking an old road, we headed through a heavy bit of cover in the dusk of the evening, and a few moments later lost the best chance we had during the day. There was a sort of double trail through the woods, with a fringe of heavy cover between the paths. As we went along one trail four grouse went out of the other, one after the other, and had we been 20 feet closer we would in all likelihood have killed all four. We followed these birds into a dense thicket, and just about dark one rose high over the cover and came directly toward us. Mr. Mershon loosened a handful of feathers, but the bird did not stop, and I killed it an instant later. Counting up our entire bag for the day, we found that we had five partridges and five quail, of which most of the birds were in Mr. Mershon's pocket, about the usual ratio between him and the average fellow citizen who thinks he can shoot partridges.

When we got back to the car that night we found that no one had had any special luck, our own bag being high for the day, though every one had quail and nearly every one had partridges. Jack Morley, who is a very good shot, had rather an unlucky day, and could only show four quail as the net results. It is one of Mr. Morley's misfortunes that he always gets lost when he goes out hunting, and his comrades banteringly asked him how many times he was lost during the day.

"Only once," he replied. And a moment later he added, thoughtfully, "and that was all the time."

Jack Morley, like every other Michigan man, goes deer hunting now and then, and following the ordinary pine woods custom he usually takes a compass and a map. One day he was out hunting, and as usual was lost, when he met a homesteader of whom he inquired the way to camp.

"Where is your camp located?" said the native.

"It's somewhere down in the woods here," said Jack; "but the woods all look alike to me. Oh, I remember where it is; it's on section 37. The boys told me if I got lost to remember that the camp was on section 37, and then I could always get back easily enough. Now which way is section 37 from here?"

The woodsman scratched his head. "Blamed if I know, stranger," he said. "It must be in some other township than this. We ain't got but 36 sections in this here township." It was not until Mr. Morley had gotten back to camp that he began to realize that there are never more than 36 sections in any township! From that time to this, he has always gone by the name of Section Thirty-seven.

A comparison of notes for the first day, or, rather, half day, of shooting showed that something like fifty or sixty partridges had been put up, but not very many bevies of quail. Mr. Harvey and Mr. George Morley found more quail than anybody, but had bad luck handling them. Mr. Humphrey and Mr. McCarty came in with a nice lot of birds between them, and Mr. Briggs and Dr. Cross, who took it easy and did not go far from the car, killed more quail than any of us, although they saw no partridges.

That night for dinner we had a big fat turkey gobbler, roasted, and Jake and Harry never covered themselves with greater glory than on this occasion. If the Saginaw Crowd was ever hungrier than it was that night, it is something that ought not to be written down. After dinner every one put on easy clothes and slippers, and the rest of the time until bedtime was spent in chasing Jack Morley's dog out of the sleeping berths, into which he had a great passion for climbing.

"That dog of mine," said Jack, "is a warm personal friend of all my boys, and if he ain't too good to sleep with my family he is about good enough for you. Let him alone; he is only trying all the berths to see which one is mine. It's a heap better to have him get in where he has sheets than to make him sleep on the plush seats and get short pointer hairs into the upholstery." There seemed to be very little answer to this argument. Everybody went to bed at about 12 or 1 o'clock and slept so soundly that it was impossible to tell who during the night was most favored with the attentions of Mr. Morley's impartial dog.

Quail in Illinois.

Our quail season has little more than a week yet to run in Illinois, and I imagine that our shooters will experience a genuine regret when the end comes, for such a quail season we have not had for very many years. Nearly every one who has been out has met with more than average success. The bags for last week have been much smaller than they were earlier in the season, and this is owing to the fact that Bob White in the middle of December is a remarkably tough and hard flying bird. To-day No. 9 shot is too light a charge to use on quail, and No. 8 is very much better. One shooter tells me that he uses No. 8 in the right barrel and No. 7½ in the left. Dr. Miller, one of the most successful quail shots that we have here, tells me that he uses No. 7 shot on quail the season through. I think No. 7 unnecessarily large myself, but after all, the main thing is to hold on the bird. One thing is sure, nearly all our shooters who came in this week agreed as to the extremely high velocity and flat trajectory of the quail.

It may be interesting to know a few of the better points for quail in this State, more especially for service next season. Of course it is to be remembered that Illinois runs a long way to the south of Chicago, and its lower extremity is practically in southern country. The best of the quail country is in the southern half of the State. Anywhere south of the Big Four Railroad, or down the Illinois Central as far as 200 miles, brings one to a grand natural quail country. Effingham is a good place to go, although it is a country of market-shooters. To the south of Effingham there is fine quail ground. One should go out into the country eight or ten miles.

Dieterich, Ill., is a good point to remember. Two guns came back from there this week with 300 quail. East of Dieterich, and near Greenup, there is a quail country which is spoken of very highly indeed by some of our most successful shooters.

Shelby county, Ill., is one of the great quail counties, and one is pretty safe to go there for a hunt in any ordinary season. It is here that my informant told me he once killed forty-five quail between 10 o'clock and 1 o'clock of the same day.

Vandalia, Ill., is another very good quail point, though here one meets a rather more difficult shooting country than the cleanly farmed regions above mentioned. The shooting at Vandalia partakes more of the thicket and brush cover in which Bob White is very much at home with himself. Bicknell, the old field trial point, is in a good quail country also, and I remember once to have put up seventeen bevies there in a part of a day.

Neoga, about 175 miles southward in Illinois, is a very good place to remember, and has been the scene of some very heavy bags this year.

Bloomington, Ill., is reporting some fair bags of quail of late, but I do not think this point is quite far enough to the south, nor is it quite so good a natural quail region as other points a bit lower down in the State.

Indiana Quail.

Winamac, Monterey, Servia, Huntington, Ora, Newton, and Rochester, are all good Indiana points to bear in mind for quail. These have all reported good returns this year, though not so good for the last week as earlier, no doubt, for reasons above suggested. In Ohio the quail crop has not been so good this year as it was last, and this I believe to be true also of Michigan. The banner States for this section were Illinois and Indiana.

Movements of Western Sportsmen.

Mr. H. G. McCartney, of this city, owner of the celebrated Kabekona camp of Minnesota, is just back from a stay of several weeks at Hot Springs, Ark. Mr. McCartney did not get time to go out shooting while at Hot Springs, and I understand that no stranger ever does get time to do anything there except take baths and sign checks, but he now and then took a little horseback ride out into the country, and thus saw something of the region. Sometimes he saw deer, and on one day met five nice ones in a bunch near the road, but he neither saw nor heard of any wild turkeys, and did not learn of any very good quail country near town. He says that the season had been very dry, so that hunting over the dead leaves in the woods was next to an impossibility so far as any success was concerned. On the whole, he did not think the Arkansas season a howling success, but he speaks with respect of the baths, the air and the scenery, to say nothing of the bills of the doctors, hotels, and everybody else. It was on this trip that Mr. McCartney witnessed the Bald Knob squatter type at its best, and he states that he never saw any beings which could be called just the counterpart of these. He often met them moving, with team, cows, dogs, squirrel rifles and all, just as my friend Irwin and I saw them sometimes moving on below Little Rock. Where they are going no man knoweth, but they have to move.

Mr. Walter Dupee, of this city, is figuring on a nice little quail shoot in lower Illinois before the close of the season, going in opposite St. Louis.

Mr. W. P. Mussey, of this city, was at Bloomington for two days with the quail this week, shooting with Messrs. Tart Radburn and Luke Kohler, of that city. They had some fine sport on fast birds in timber, getting forty-five in two days.

Mr. Charles Christadoro, of St. Paul, was in Chicago yesterday for a stay, all too brief, on his way between this city and the seaport town known as New York.

Col. C. E. Felton, of Chicago, goes this week to Mattoon, Ill., for a wrestle with the quail. I should have much more confidence of his getting a mess of birds if I were going along myself. The Colonel's system is all right on pigeons, but a quail always goes out just before you call "pull," and before the proper preliminaries have been satisfactorily completed. I take this method of accepting Col. Felton's challenge to a race on live quail, with no strings upon the same, this being a matter which has been pending for some years. I have been waiting for him to get so old I could beat him, but he is getting younger all the time, so we might as well have the race now as to wait twenty years or so more.

By the way, I should say that Col. Felton is one of the original and continuous kickers against the non-resident license idea. He shot out in Dakota, in Bonhomme county, S. D., this fall, on prairie chickens, and took out license No. 1 in that county. He offers to wager that out of 500 shooters in that county, his license will appear as not only the first, but the only one to be taken out, it thus shining like a good deed in a naughty world. Col. Felton never breaks a game law, but he keeps some of 'em only with the severest mental reservations and the conviction in his soul that he could make a much better law himself.

Mr. O. von Lengerke, of this city, makes his weekly quail shoot this time at Winamac, Ind. The latter is a most weird locality, and known the world over as the region in which is located the Pink Mink marsh, upon which many fateful things have happened in days gone by.

Dr. Cross, one of the "Saginaw Crowd" with whom I had so enjoyable a sojourn a couple of weeks ago, is today in Chicago, and will soon be on his way West to his home in Stockton, Cal.

Mr. Frank Parmalee, of Omaha, the well-known representative of the Remington gun, was in Chicago for a short time yesterday, on his way to New York. Mr. Parmalee says he will be back before long, but has not time now even to talk shoot.

Mr. A. W. Adams, president of the Eureka Gun Club, is a little late this year in starting on his customary Southern trip. He ponders Florida, but Florida is not very popular among Chicago shooters, and I presume Mr. Adams will turn up this winter in Texas as usual.

Mr. F. E. Adams and Mr. J. L. White, of this city, took out some beagles and had a nice rabbit hunt this week at Sylvia, Ind. They got a couple of dozen rabbits and saw a good many quail.

Messrs. John Waddell and D. G. Henry, of Grand Rapids, Mich., both men with much trout in their history, are expected here in Chicago next Tuesday, to attend the informal dinner of the Chicago Fly-Casting Club, which promises to be a very pleasant little affair. The programme will include the presentation of the season prizes, and will consist besides largely of reminiscences of life piscatorial as experienced by members of the club and their friends. It seems to me that these meetings ought to be kept up and expanded into something of a permanent nature, akin to the meetings of the angling societies of England, whose pleasant doings we see recounted in the sporting press of that country.

Minnesota Park Matters.

Col. Cooper has returned from Washington, and to say that his enthusiasm remains unquenched in the matter of his Minesota park is to express the case but weakly. Whereas formerly he bubbled, he now boils with enthusiasm, and it is of the sort which dieth not until it hath attained. He says with positiveness that the proper bill will be introduced in Congress this session, and meantime the Nelson-Olcott dead and down timber act suspended. I make bold to say that when this bill does come up in Congress there will be a lot of fun, as well as some hard arguments connected with the presentation of the

matter. Then there will arise Private John Allen, and eke Mr. Cockran, with Messrs. Tawney, Clarke and many others who can talk and think and spin a merry quip with any that shall offer. This will be one of the best things of the session.

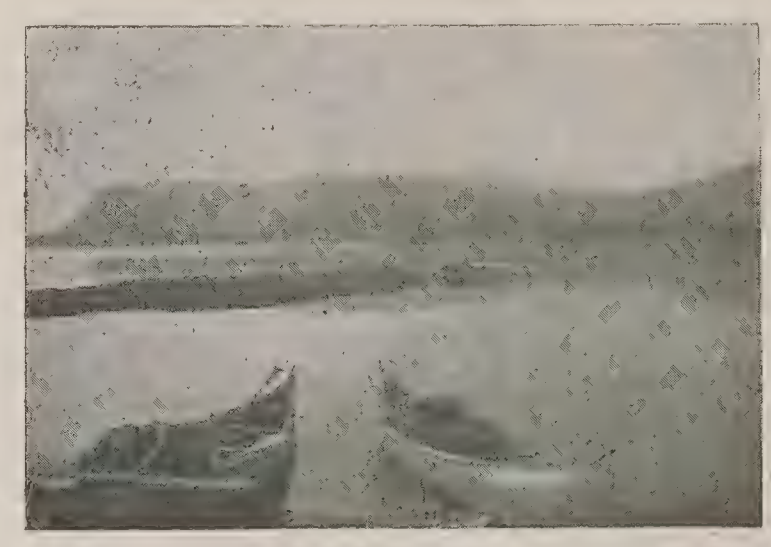
By the way, I observe that Congressman Tawney, of Minnesota, has been selected as the party whip, charged with the duty of rounding up all members who would rather sit in the cloak rooms and listen to John Allen tell stories than sit at their desks on the floor of the House and hearken to exceeding great oratory. Mr. Tawney is a fine-looking man, and has a nice little way with him; but what shall be said of his record? Was it not he who forsook the gang at 11 o'clock, the same merely in the shank of the evening, and retired to bed, upon the trip south from Cass Lake, upon the plea that he was putting his sons to sleep? And was not one Fred Stephenson, a tall man and very husky, the same a lumberman from Menominee, appointed sergeant-at-arms to hale forth the said Congressman Tawney and bring him before the bar of the House there assembled? Marry, it much doth seem that this Stephenson were a fitter whip than Congressman Tawney, for that if need be he can bodily carry forth any who shall be recalcitrant.

E. Hough.

480 Caxton Building, Chicago, Ill.

Three Weeks in Northern Maine.

All of the readers of the Forest and Stream who have fished and hunted in the Maine woods know what it is to anticipate a three weeks' trip there, especially those who are "chained to business" the balance of the year. I had passed through all the various stages of anticipation from a simple desire in January to the desperate encounter (in my dream) with a wounded bull moose, which charged down on me with mane bristling and eyes blazing, and my life was only saved by my wife inserting her elbow between my fourth and fifth ribs and shouting in my ear, "What is the matter with you? Are you dreaming about Maine again?" This five nights before I was to start on my trip. Well, I guess the majority of you have tramped the old familiar haunts in dreamland—have caught your monster trout, shot your giant moose with antlers like the branches of an oak tree, only to awaken and find yourself in a great state of excitement, and tired from the imaginary chase.



On Oct. 6, 1899, at 1 o'clock P. M., I met in the Grand Central depot four friends, all lovers of rod and gun, who were to accompany me on this annual trip to Maine. We had just time to bid our wives and friends good-by, when with words of "Good luck," "I hope you get your moose," singing in our ears we boarded the train for Botson. When we reached Boston and had transferred our luggage to the B. & M. depot, we found the time table had been changed and we had barely time enough to procure tickets, check baggage, scald our throats with a cup of hot coffee, and we were moving again. It was a case of "Off agin, on agin, gone agin, five of us."

Our destination was Chamberlain Lake, via Moosehead Lake, and our guides were to meet us at Greenville. We arrived at Bangor the next morning about daylight and had breakfast in the station. As we had to wait nearly an hour for the P., B. & A. train we took a walk around the city in the fresh morning air. Soon we boarded the train for Greenville, and at Milo Junction we were surprised to meet two of our guides, who had waited for this train. There were handshakings and pleasant greetings. An hour more brought us to the end of our railroad journey and to the steamboat dock in Greenville. Here we met the rest of the guides and the cook with tents and provisions. We all boarded the little steamer and were soon steaming away up the lake at a good rate of speed. The captain was a very affable and accommodating man and seems to be a favorite captain with the guides. There was a cold north wind blowing down the lake, but I remained on deck nearly all the day, for this was my first trip up the lake and I was delighted with its scenery. About 1 o'clock we arrived at the Kineo House, which is half way up the lake, and here we all had dinner. Just above the hotel on the lake is Profile Mountain, where you see distinctly silhouetted against the sky the profile of an Indian. To the east we saw old Katahdin wearing a cap of snow and towering to the heavens far above the surrounding mountains.

On our way up the lake we stopped twice to let hunting parties go ashore with their guides. They simply dropped their canoes over the side, loaded in all their baggage and pushed off, while those on board bade them "Good-by" and "Good luck," and we passed on up the lake, while their canoes grew smaller and smaller in the distance and finally faded away in the shore line. Later in the afternoon we reached the northeast carry and had our baggage taken to the Winnegamock House by that famous horse railroad there. It may not be pretty, but it does the work. Here we changed our clothes, packed our grips and sleeping bags, placed our good clothes in our trunks and expressed them around to Grindstone on the East Branch, for we had decided that when we went from the Allegash we would go down Chamberlain, Telos, Grand Lake and the East Branch to Grindstone, and it would make our home trip more pleasant and treat us to new scenes. As we emerged from the hotel in our hunting togs we had a businesslike look.

While we are together let me introduce you to our party, which consists of R. W. Haff and guide, Henry Soucie; C. E. Brown and guide, Joe Pelkey; W. Burr and guide, Thefolia Soucie; C. F. Lehman and guide, Jack McNally; the writer and guide, Gilbert Joy. My guide, by the way, is a nephew of Jack Darling, one of Maine's most famous Indian guides. Our guides were all first-class, the most careful and conscientious lot of men we could possibly have found. Our trip was a trying one for guides, as very little rain had fallen for two months, and all streams were very low, and this made dozens of hard and difficult carries. Their powers of endurance were simply marvelous. I never heard one word of complaint. Three of the guides did not smoke, chew tobacco or drink liquor of any kind, and only one would taste liquor at all. I think this is quite remarkable for men who are brought up in the woods and have to labor hard and long at the coarsest of work, logging in the forests all winter, driving logs all the spring, sometimes working in the rain all day on the drive, soaked to the skin, and when it gets too dark to work he starts for the "wangum," which may be five miles away, and he has to pick his way through the forest in the dark, through slush and snow a foot deep; and it is 10 o'clock at night before he gets a mouthful to eat and turns in to sleep in his wet clothes. To any one wishing to employ a guide I will personally vouch for the five named here, and will be pleased to give their address. I have digressed somewhat, but I have a great big warm place in my heart for Maine guides.

We loaded our canoes and baggage on a wagon, and made the carry to the Penobscot House, on the West Branch. Here several years ago a white man was shot and killed by an Indian in a row over a game of cards. After the white man had struck the Indian in the face with his hand the Indian went to a lamp that was on a bracket near a window, turned the bracket round so the lamplight shone full in the window, turned up the wick, walked out into the hallway, picked up a gun that was standing there, walked outside and to the window where he had arranged the lamp, took deliberate aim at the white man and shot him dead. He immediately left

LAKE AND MOUNTAIN.

the country and has never been captured, and as far as I could learn no great attempt had ever been made to capture him.

The next day was Sunday, so we intended to take matters leisurely. We ate breakfast about 7 o'clock and then made a start down the stream in our canoes, intending to make Cheesuncook Lake that night. The morning was bright and balmy, the foliage on the trees was in the height of its autumnal coloring, the river stretched out like a serpentine mirror, reflecting the foliage along its bank. On its surface were dancing nine canoes, six belonging to our party and three to another; and when we formed in line, and made our start down the river, it was a picturesque and beautiful sight. Brother Haff, who is an expert player on the concertina, brought forth his instrument and soon the woods were echoing back strains from popular airs. Again, some familiar air would be played and Brother Burr's sweet tenor voice would float out over the water, to be joined when the chorus was reached by Brother Brown with his rich baritone and Brother Lehman with his deep bass. The guides were entranced, delighted, for, as they said, it was seldom that they ever heard any music. The hours passed quickly, and before we were aware it was 1 o'clock, so we went ashore and had coffee and a hasty lunch and resumed our journey. Soon after passing Rocky Rips I sighted a large bull moose standing in the water about 500 yards ahead. As the season was not open yet, no attempt was made to get near him; but we sat in the canoes and admired him, and several invitations were extended to him by the boys to meet them one week from that day on Mud Pond at 2 P. M. and lunch on .30-30s. Time was getting precious, so we started on down stream and our friend with the antlers strode leisurely into the forest.

From this time on we paddled very industriously and reached the Cheesuncook Lake House about 5 o'clock. This rustic and ancient hotel is beautifully situated on quite high ground overlooking this pretty little lake, and here I saw the most grand and gorgeous sunset it was ever my good fortune to witness. In the near distance was that group of mountains of which Katahdin is the towering center, and it was snow-capped. As the sun descended, the low land and lake were covered with a deep purple glow, which was lighter and brighter as it reached up the mountain side, and when the snow cap was reached it was a beautiful pink. This was constantly changing, the deep shadows finally climbing to the top and dispersing the bright colors, until all was lost in the shadows of night. We stood for some time spellbound and filled with silent worship.

Next morning we were up and breakfasted at 4 o'clock and started up Umbazookskus Stream. About 10 o'clock we reached the carry, which is made partly on sleds and partly on wagon. This carry is about three miles long, and the price is $5 per canoe, baggage included. We accompanied the first load to Mud Pond, and while we were waiting for the second the guides put up a tent and we had a lunch. It commenced to rain and kept it up as a drizzling nuisance all the afternoon. We crossed Mud Pond and the guides hauled the canoes down the stream which is the outlet, and we walked nearly all the way to Chamberlain Lake. This will give you an idea of how low the water was, for ordinarily one can canoe through there without difficulty. Just before we reached Chamberlain we started a herd of deer feeding on some meadow land. Several shots were fired, but the distance was too great and only misses were scored. It was now nearly dark, and the rain was coming down in torrents; but we paddled up Chamberlain for about three miles and decided to camp for the night. Here the expertness and thoroughness of our guides were shown, for in fifteen minutes' time they had our tent up and a fire burning. This was a most disagreeable night. The rain did not stop falling until after midnight, yet we were dry and comfortable in our sleeping bags, which were all that could be desired—that is, waterproof and warm.

One word about sleeping bags. I have heard considerable profanity come out of a sleeping bag when the occupant wanted to turn over and got caught half way, or, when lying on his side, he wished to draw his feet up and found there was not room for his knees. My friend Lehman had a bag that tapered from the head to the foot, with no foot room. I have seen him as badly twisted in that bag as the Irishman who was a little full in the morning and got his trousers on hind side before. He started up a ladder, and when near the top the ladder broke and Pat fell to the sidewalk. His friends ran to him and picked him up, carried him inside the building and laid him on some planks. While waiting for the doctor to come one of Pat's friends says: "Pat, are you badly hurted?" Pat looked down toward the feet and saw the seat of his trousers in front as he replied: "Boys, I don't think any of me bones are broken, but I've got a divil of a twist." The kind of sleeping bag I have been satisfied with is of waterproof duck, same width from top to bottom, 7 feet long by 3 feet wide. Inside of this I put two bags made to fit, one inside the other, made like the ordinary bed quilt of tufted cotton. This makes a soft bed to lie on, and I have never been cold while in it.

The next morning we were up early, and while the head guide canoed across the lake to Chamberlain farm for some pork and flour the cook prepared breakfast. This was soon over and we started up the lake. About two miles further on I saw a small deer feeding on shore. As we needed meat for camp, four of the boys opened fire on him and he fell. Two of the guides went to him, and had him dressed in about ten minutes. The distance was 250 yards, and all four balls had struck him. This I consider fine shooting from a canoe. We canoed on up to the head of the lake, where the Allegash Stream flows into it; then up the stream about half a mile, and here we made our permanent camp.

After dinner Lehman and I set off with our guides for Stream Pond for a hunt. We hunted until dark and then started to return to camp over one of the worst of Maine roads. Friend Lehman was unused to anything like this—in fact, it was his first trip to the woods—so he came along puffing like a locomotive close behind me. He said: "I can get along all right. I watch your feet and step where you do." Just then we struck some slippery corduroy road and I heard a dull thud, and looked back in time to see arms and legs waving in the darkness. He was soon righted, and as he got near me said: "Hall, that was a mean trick you played on me. You knew I watched your feet so I could put my foot down where you did. I thought I saw you raise both feet at the same time and I tried to follow suit, and it nearly killed me. Hall, don't do that again." I promised and we soon reached camp, where a hot biscuit and maple syrup eating match was on between Horace the cook and the various members of the party. We joined the hungry band and ate with a relish born of our evening's tramp.

It was now near the 15th, and to-morrow we meant business. As our party was too large to hunt from one camp we decided to split up a bit. So Mr. Haff and myself, with our guides, started the next day with canoes and baggage for Allegash Lake, eight miles away. The guides took the canoes up stream, hauling over the rocks and gravel bars and carrying around the worst places, while we walked an old trail that follows the course of the stream. About 1 o'clock we reached the dam, which is near Allegash Lake. I caught a 4-pound trout in a deep hole and this we cooked as soon as the guides arrived; and how good that meal tasted after such a tramp. While we were eating our broiled trout friend Burr and his guide came along on their way to Otter Pond. They joined in our feast, which was soon over, and then we parted to meet a week later. We resumed our journey to the lake and arrived there about 3 o'clock. We found an old lumber camp there, with bunks and a fairly good cook stove, which made the place quite cheerful looking.

After putting all our baggage inside we started up the lake, to look for game. We canoed up to the "Thoroughfare," a pleasant stretch of dead water at the head of the lake about one and one-half miles long. Mr. H. and his guide were somewhat in advance of us, when I saw them stop paddling and we pushed along near them, when we saw the cause of their stopping. A fine young bull moose had come out on the bank and was looking at them. As we remained quiet he walked leisurely down the bank and into the water, where he commenced eating lily roots and water grass. He was a fine specimen, young and healthy looking, and as sleek as a well groomed horse. He had only three small prongs on each horn, so he is roaming the Allegash to-day. We watched him feeding for at least ten minutes, when he winded us and commenced to look ugly; with mane bristling, giving an occasional grunt he walked out on some meadow land. Here three or four deer hoisted their white flags and started for timber, and he after them with that peculiar swinging trot. Just at the edge of the timber he turned and gave us one defiant look, as much as to say, "Who cares for you?" and then plunged into the small growth and swept through it like a whirlwind.

We went on up stream, but did not see any more moose that night. The wild ducks here were so tame that as they flew past the canoe we could almost hit them with the paddle. Near dark a large owl came and perched on a tree about 20 feet from the canoe and surveyed us curiously. By the way, all game up in this locality was remarkably tame. Foxes trotted along the bank within 25 feet of the canoe and minks would come within a few feet and blink their beadlike eyes at us. It was evident that most of the game here had never seen man before, or at least had not learned that man was its deadly enemy. I have seen a deer walk into the road in front of me not 100 feet away, and as long as I stood still it would watch me, occasionally stamping one foot and advancing toward me two or three steps until we tired of it and walked toward her, when she trotted off to the woods. We got back to camp about 8 o'clock, and after a nice warm supper retired.

After this for a week we hunted most industriously. During this time we visited Russell, Johnson, Mile and Second ponds, always seeing plenty of deer and moose every day; but they were cows and calves and spike horn bulls. In hunting near Johnson Pond we came across a notice posted on a large tree to the effect that

any one crossing that line would be shot. Friend Haff, who had been hunting mostly in that section, took a sudden dislike to it, and said if there was any one living there that felt that way, why he was not going to argue the matter with him, and he was not going to call on him until he received a written invitation, so he would know the man didn't have any hard feelings. It is strange what a sudden dislike one will take to a certain section of country. Do you know that I took such a dislike to that Johnson Pond section that I could not be induced in any way to visit it unless I had positive proof that old man Fountain, for such is the outlaw's name, had a double stroke of paralysis and was entirely out of ammunition. On account of this coolness between us we never met.

One of the guides, who knew the story of this outlaw, as he called him, said that several years ago this man Fountain was with a man down on Moosehead Lake and saw the man receive quite a sum of money. They started to cross the lake together on the ice, but the man with the money was never seen again, though a body supposed to be his was found when the ice went out of the lake in the spring; but it could not be positively identified. Fountain disappeared from his usual haunts about this time, but a long time afterwards was seen by a guide who knew him where he is now living. He has a log cabin with port holes on every side and keeps a number of rifles loaded and ready for use. In his belt he carries two heavy revolvers and a large knife. He always carries his rifle in his hand. He hunts and traps here, in this secluded place, and takes his furs across into Canada, which is only twenty-five miles away, and trades them for such articles as he may need. I give you this story as it was told to me by the camp-fire glow. If any of the readers of FOREST AND STREAM have met this strange character I would be pleased to hear of it.

One of our guides, John McNally, told me about a cave, high up on one of the mountains that slope down to Allegash Lake. He said the entrance was very small—just large enough to admit a man crawling on hands and knees—but that a short distance from the entrance it widened and opened into a large room which connected with other rooms, all interesting, and some of them filled with stalactites. The explorers found one deep chasm which seemed almost bottomless, for they threw some stones in it and could hear them bounding against the sides for a long time; and Jack said it was five minutes before it struck bottom; but of course he was deceived by the echoes in the cavern. Jack said it was a mighty big hole, but he didn't think it was as deep as a well he knew over in Canada, where a woman fell in and a man passing three days after heard the splash. If I visit the Allegash next fall I will visit this cave, and if I find it of sufficient importance I will let the readers of FOREST AND STREAM know about it in detail.

THE CAMP.

We had been hunting here nearly a week, and as our provisions were getting low we decided to go back to the main camp. So early the next morning the guides took our baggage and we started down stream and arrived at camp about noon. There were warm greetings and each wanted to know the others' experience since we left the week before. Our tale was soon told—lots of hard work, but no heads. Lehman was as happy as a lord, for he had secured a fine doe and a four-pronged buck. Brown had a monster buck hanging near the camp, which he visited every few hours to admire the spreading antlers, and he had every reason to be proud. Burr had captured a grand old bull moose with a fine set of antlers, very even and perfect, with a 50-inch spread and twenty-two points. Burr had gone to Stream Pond one morning, and as he walked cautiously to the water's edge he saw his royal highness standing in the water not more than 100 feet away. At the second shot the moose reared on his hind legs and fell backward in the water, dead. A neck shot had done the work.

Next day, as the wind was fair, we decided to start for home, so broke camp early and canoed down Chamberlain Lake, which is about twelve miles. We reached the Thoroughfare at the foot of the lake at 12 o'clock and stopped there at an old lean-to and had dinner; then we canoed on down through Telosinnis and Telos lakes and night overtook us at the dam. Here we met some parties coming in who told us that Webster was a dry brook and we would have to get hauled across to Second Lake; so one of our guides, Thefolia Soucie, said he would go down to Trout Brook farm and get a team. To do this he had to walk thirty miles, but he did not seem to mind it in the least. This same guide a few years ago walked and ran in one day from the arm of Chamberlain Lake to his home in Sherman, a distance of ninety miles.

While we were camped at Telos dam a party came along with two moose heads, and the Indian guide who was with them said there was good hunting over in burnt land on Braily Brook, and he said: "You go there sure get moose." So when we reached the foot of Webster Lake, where the team met us, I talked over the subject with my guide, and he decided to strike across through the woods to Braily and so on around to Second Lake, where we would camp the next day. This was hard traveling, but we finally reached the burnt land. This was a fine place to hunt, for the growth was low, and standing on a ridge one could see a long distance. As we came up on one ridge I saw a handsome bull moose standing on the next ridge feeding. Standing as he did broadside to me, he was a grand big mark, hard to miss at 40 rods. Well, it was all over in a minute. You who have been there know how it is. Two shots through heart and lungs and another to make things cock sure. Then handshaking, and we commenced to off with his head. We were too far from camp (twelve miles) to think of carrying this head in (it weighed in the express office 86 pounds), so we tramped on to camp. We got the head out the next day by taking a horse in as near as we could get him to it, tying a long pole on each side of the horse, the ends of the pole dragging on the ground; to this we lashed the head and so brought it out to camp. Here were more handshaking and rejoicing at my good luck, for this was another fine head, with handsome horns and a full 50-inch spread. Bert Howe, of Howe & Kerns, of Trout Brook Farm, did all our toting and hauling, and we found him a courteous gentleman, reasonable in his charges and extremely obliging. He is a "square man." We arranged with him to meet us the next morning at Grand Lake and take us out to Patten by buckboard. Oh, that ride over that road; will I ever forget it! It was up and down, over rocks and stumps, through mud holes over the hubs; but all things have an end, and how good that comfortable bed did feel when we reached Patten at 10 that night. This was our last night in camp, as we could not get down the East Branch and had to leave our guides the following morning on Grand Lake. After supper we sat around and smoked for a while, but gloomy silence seemed to hang over our camp. Finally Haff brought out his concertina, and after playing a few familiar tunes started that one which always touches the heart and will never grow old—"Home, Sweet Home." We started to sing it, but after the first few lines the voices began to grow husky and every one seemed to have something the matter with his throat, and Haff's eyes seemed to bother him so he could not see very well; so he laid down the conecrtina and we all strolled out in the night, each one with his thoughts of "Home, Sweet Home."

From Patten we telegraphed to the station agent at Grindstone to put our trunks on the morning train, which he did, and the baggage master kindly allowed us to change our clothes in his car, for he was like all the other railroad employees we met in Maine, extremely obliging. At night we reached Boston, and the next morning Brooklyn, and we were home at last from our three weeks' hunting trip in northern Maine.

C. A. HALL.

BROOKLYN

Turkeys in Brush Creek Gulf.

BLEDSOE COUNTY, Tenn.—This is the time of the year when the thoughts of the sportsman turn to the leafless forest, where the crack of the rifle and the call of the turkey on the hillside are music in his ears, far sweeter than any of band or orchestra. Silently I crept from my chamber while it was yet dark, and by the time the sun began to peep over the eastern horizon I was far out in the heart of the mountains, listening for the morning call that wild turkeys invariably make after leaving their roosts and when beginning the day's search for food. Brush Creek Gulf is a far-famed break in the mountains, noted for its wildness, and as a resort of game. Far down the gulch I heard the swish, swish of wings, followed by the well-known call turkeys make when they come from their roost. No one but a turkey hunter can appreciate the exciting anticipation of sport as I sought a place of concealment and brought my Winchester to bear down the gulch from which the game would presently come. But, alas, what was my disgust to hear, instead of game, a great haw! haw! haw! and coming out of the gulch was a party of cross-tie cutters, who had made their camp for that night in the gulch, and unintentionally had spoilt my sport for that morning. But I did not feel entirely discouraged, so I mounted my horse and went hastily to a distant part of the mountain, and during the day had a fair share of sport, as I succeeded in killing two turkeys and a small doe.

J. W. DRANE.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

Adirondack Game.

MR. FRANK A. CUTTING, of Boston, owner of the Cutting preserve in St. Lawrence county, is a man who takes the keenest interest in game legislation and matters pertaining to the Adirondack region of New York. For seventeen years he has visited the woods and noted existing conditions, and his opinions are formed from mature observation. In the course of a conversation with a representative of FOREST AND STREAM, Mr. Cutting remarked that he differed with the views of Colonel Fox on the deer law, as expressed in an interview published in the issue for Nov. 11.

"Colonel Fox believes in hounding," said Mr. Cutting. "He states that in his opinion every man should be allowed to hunt as he pleases, and that the interest of the deer supply would be served better by shortening the open season than by the present law, which forbids the use of dogs.

"Now, if hounding is not detrimental to the supply, why is it that they have five deer in Maine to-day to one in the Adirondacks? Any one who has hunted in both territories will admit that the deer are more numerous in Maine, which is a still-hunting State, acre for acre, than in the Adirondacks, where hounding has been in full swing until very recently. The Adirondacks have all the natural advantages to make a perfect sportsman's paradise, and were it not for the use of dogs in hunting the deer would certainly be much more numerous at the present time.

"There are a number of reasons why hounding lessens the supply. For one thing, you will find a great many more men who will sit in a boat on a lake till the dogs drive a deer into the water to be killed than would ever think of walking a mile through the woods to get a deer still-hunting. The hounds often get loose in winter and play havoc with the deer, catching them and killing them in the deep snow.

"Last winter I found that the teamsters hauling bark on my place were taking back dogs in the woods and letting them run. My man told them he would shoot any dogs he found. At various times recently he has shot three or four hounds put out by parties in violation of the present law.

"The advocates of hounding say that running the deer doesn't hurt them, but such a statement is contrary to common sense. No farmer wants his cows or sheep chased all over his farm by dogs; that isn't the way the farmer goes about improving his stock. Dry does are very common in the Adirondacks, and I am inclined to believe the natives' statement that their barrenness results from hard races with the dogs the previous fall.

"Colonel Fox says the season begins too early, and states that game killed in August spoils before it can be utilized. It cannot be taken out of the woods, of course, but it can be very easily kept till it is eaten. We keep venison for a week at a time in August by packing the meat in a large stone jar and covering it with salt and sinking it in a spring hole. If the season is shortened at all, the opening should not be made later than Sept. 1. A great many people like to take their families to the woods during the hunting season, and later in the year it is too cold and there is no bathing.

"In Maine the season formerly opened Oct. 1, but now they let people kill deer by paying for a $6 license after Sept. 1. The venison was being eaten in September, and the State was not getting anything out of it, and they thought they might as well make it legal.

"In the Adirondacks there is not much game shot in the early part of the season, and all that is killed is eaten in the woods. It used to be that the natives would go back into camp for a week in August and kill deer, and jerk the meat for carrying out, but all that is done away with now.

"Personally, I don't believe in jacking, but it never was the easy way to get a deer by this method of hunting that some people imagine.

"As a matter of fact, skill of a high order is required to get up to a deer at night or any other time. All Raquette River guides ran dark, and jacks were only used for sighting on the deer. The boats were propelled so noiselessly that they passed each other at times within 10 feet, each following the right hand bank of the narrow river, without attracting attention. I have been out when half a dozen other boats were on the river in the immediate neighborhood, and never seen one of them. The men in the southern part of the woods have a good deal to say against the men in the northern. They have no cow lilies there, and the deer are not so much around the water feeding.

"Colonel Fox advocates a law absolutely protecting deer for five years. I would suggest that does be protected for that period. There are lots of great, big, overgrown bucks in our country, some of them with tracks measuring 3 inches across, that might just as well be killed as not. The prohibition of the killing of cow moose in Maine has helped to increase the stock, and if only buck deer were killed in the Adirondacks, the hunting would be greatly improved.

"The supply would also be increased if the law limiting the number of deer to be killed by one man was enforced where the natives are concerned, as well as in the case of visiting sportsmen. A party of four natives this fall had eleven deer that they had killed hung up at their camp at one time. The natives also kill a great many fawns after the middle of September, when they get their fall coat and the spots disappear. They kill the does first if they get a chance, and then wait till the fawns return and shoot them too. The natives interpret the law prohibiting the killing of fawns as only applying to the animal in the spotted coat. This is not correct. A fawn is a fawn until one year old, and parties killing these fawns ought to be prosecuted, as a person who has any knowledge of the woods can tell at a glance that they are not one year old.

"In my opinion, the deer have been increasing in the Adirondacks ever since the wholesale shipment of venison from the woods was stopped. The different laws enacted since that time have all helped increase the supply, and the hunting is destined to improve all the time. The lumbermen are a factor in the increase. When the woods are opened by taking out the old trees, there is more undergrowth for feed and for protection for the deer, and

not only do the deer increase in numbers, but they increase in size as well.

"I should like to see the State go into the work of stocking the Adirondacks with moose, caribou and elk, just as it has stocked the Catskills with deer. A couple of thousand acres of burned lands in the eastern part of the woods might be taken up and fenced, and stocked with these animals, and after they had increased to the capacity of the inclosure, the surplus could be turned out in selected localities to shift for themselves. It should not take long in this way to have a breeding stock of big game scattered over the Adirondacks, and the attractions of the region from the sportsman's standpoint would be very greatly heightened." B.

In New England.

BOSTON, Dec. 9.—Still the American Express Co. continues to land deer directly into the stores of commission agents in the Boston markets. I saw two handsome bucks unloaded from one of the wagons of that company yesterday into a well-known commission store. There were no names on the game—only a card or tag showing that they had been forwarded by the American Express Co. If this forwarding business is all clear and above board, why is not the shipper's name on the venison, the same as it would be on any other goods? It does no good to ask either the express drivers or the receivers where the game comes from; they have nothing to say, or declare that they do not know. It is doubtful if hunters are now bringing this game out of Maine, for there has been an absence of snow in that section for fully a week—up to within a couple of days; hence very poor hunting. Besides, outside sportsmen have generally put up their rifles for the season.

Mr. J. H. Jones is something of an exception among hunters. He is glad that he did not shoot at a deer in the woods above Bemis the other day. He had separated from his two hunting companions and was working carefully along an old logging road. Suddenly he saw a motion in the thick trees and underbrush, at close range. His first impulse was to fire at what appeared to be the body of a deer. He was sure he saw a motion. Like a flash it came over him that his hunting companions might be returning; it was in that direction that he should be looking for them. He stooped down to get a better view. At his motion up bounded a handsome buck with a "blow" that nearly took the hat from the hunter's head. In a moment he was gone in the thick brush, and gone was Mr. Jones' chance for a shot. Did he wish he had fired? Yes. But then comes the thought, What if I had shot one of my companions? He says today that he is glad he did not fire. The danger was too great. Would that every hunter would be as careful.

Mr. William Garrison Reed has two very handsome heads, mounted by Frazar and hung in his office, the result of his hunting trip to the headwaters of the Tobique, in New Brunswick, this fall. One is a good head of a bull moose and the other a fine specimen of bull caribou. Both were shot within a short distance of each other. The moose was lured by the calling of the guide Alec, and Mr. Reed, an amateur moose hunter, tells a thrilling story of his experience. He hunted moose last year without success. This time the moose answered almost the first call of the birch horn. The hunters were in a canoe, and the paddle was quickly forced into the mud to steady the craft. Another call or two, and then Mr. Reed saw plainly the antlers of a moose through the thick trees about 70 yards away. He fired three shots with his .30-30, and then the moose started to move away. In doing so he plainly exposed one ear and a part of the head and neck. Here was the last chance. The hunter fired again, but had the chilling chagrin to see the big fellow move off. The guide jumped ashore to look for blood signs. During his absence the hunter suffered all the pangs of disappointment, that only a hunter knows how to appreciate. He had been to all his trouble and privation, only to make a miss on his first moose. But suddenly the guide calls for the rifle. There was a muffled sound in the woods. The hunters rushed in that direction. There was the moose down and breathing his last, but a few rods away.

Mr. Reed has made some careful rifle studies, figured out the speed of bullets and their striking force, and comes out roundly in favor af the little .30-30.

Dec. 11.—The open season on deer in Maine closes Friday night of this week, Dec. 15. Altogether the season will have been a remarkable one. For the past week the shipments of deer, noted by the Bangor & Aroostook Railroad, have been 112. These, added to the previous shipments, make a total of 3,504, a number greater by 127 than the entire shipments by the same road for the season of 1898, which season did not close till Dec. 31. The shipments of moose have not fallen off as badly as at first suggested. The total shipments from stations on that road for the present season, closed Nov. 15, were 145; for the season of 1898, 148.

A remarkable feature is the way deer have continued to drift downward into the more settled counties of Maine. Here they have seemed to thrive and increase, but it is a question how long they will continue to do so, if the quest for them by boys and other local hunters increases as rapidly as it has been doing. Some of the counties in that State are closed against the shooting of deer at all seasons; others are not. Vivian Bearce shot a deer in a mountain pasture in Hebron, Me., last week. Ten years ago such a thing would have been remarkable; fifteen years ago, impossible, because no deer had been in that part of the country for at least forty years. Hebron is one of the southeastmost towns of Oxford county. That part of the country is really well adapted to the success of deer. There is a great deal of what was once pasture land, now grown up to scrub spruce and pine. On this growth the branches are very thick and near the ground, and in such woods deer are really better concealed than in the heavier and older forest growth of northern Maine. Besides, there is an abundance of ground hemlock, on which deer delight to feed in late autumn and all winter; a class of deer food which is actually being rapidly destroyed by them in many sections of northern Maine. Ask almost any of the more observing guides and woodsmen, and they will tell you that ground hemlock is rapidly dying out where it is most fed upon by deer. In southern Maine there are thousands of acres of such partly grown up pasture lands, and thousands of deer might thrive there under proper hunting restrictions. But under the tremendous impetus deer hunting has lately received in that part of the country, the value of a nice deer or two to the people of such sections, a full open season of two and one-half months and a license system under which they can be shot in September—they will soon disappear forever. Such a valuable chance for the conservation of noble game should be looked out for.

A Boston sportsmen's show is already announced for 1900. It is announced to be held under the auspices of the Massachusetts Sportsmen's Association, in Mechanics' Building, commencing Feb. 21, and continuing to March 10. Everything is being done to make the exhibition eclipse the former one. Many new features will be introduced and rare specimens shown. The various departments will be under the direction of the following gentlemen: Richard O. Harding, fish and fisheries; O. R. Dickey, game birds; R. Wilton Lockwood, water birds; L. O. Armstrong, of Montreal, Indian department. Swimming, diving and other athletic departments will be under able management.

The following gentlemen are directors of the Massachusetts Sportsmen's Association: Paul Butler, F. B. Crowninshield, F. H. Prince, John E. Thayer, T. Jefferson Coolidge, Jr., Butler Ames, John Burnett, Eben D. Jordan, E. J. Wardwell, Samuel D. Parker, Francis Skinner, Jr., Thomas W. Lawson, O. R. Dickey, Samuel J. Elder, Percy Parker, J. Otis Wetherbee, John C. Watson, Edward Reed, E. C. Hodges and Charles W. Dimick. Mr. Dimick will as as manager, and F. B. Crowninshield is the treasurer of the Association. The names are a guarantee of the high character of the exhibition.

SPECIAL.

Virginia Eastern Shore.

BELLE HAVEN, Va., Dec. 4.—It has been some time since I have sent you a notice direct from our game lands. In this part the "Eastern Sho'" of Virginia, a deer or turkey would frighten our local sportsmen; but at duck and quail shooting we are in our natural sphere. Ducks were never thicker or less shy. Our boys get from a dozen to fifty per day. Our shooting is bothered considerably to what it was a few years ago. Oyster and clam boats work on the feed grounds in greater numbers than ever, and consequently keep fowl off in parts where they are hard to get up with. Just at this time, when young ducks are plentiful and foolish, we are not bothered so much, but a few weeks' shooting will teach them a lesson. Our kinds of ducks are blackheads, black ducks, brant and a few geese, also a variety of divers. Geese are scarcer every year, owing to the many oyster boats about their feeding bottoms. They keep on now to the Carolinas instead of frequenting our bays in myriads as they did some time ago.

Redhead, canvasback and mallards are rarely seen with us, as the water is too salt. In Chincoteague Bay, on the coast about thirty miles above here (Hog Island Broadwater), redhead are plentiful, but canvasback are not found on the coast except in the head of large bays, like the Chesapeake and Delaware.

Our game wardens went on duty last week. They have almost broken up trapping and night-lighting, and since this law has been in operation our shooting has greatly improved. Lighting in Chincoteague Bay has in the past few years been injuring shooting there to such extent as to prevent any shooting worth attention, except in the severest weather, but the warden there this year will enforce the law and keep the violators down.

After the 1st of January, 1900, the local law will cost wild water fowl non-resident shooters $10 the first year, $5 admision fee to our Protective Game Association, every non-resident being required to join it, and $5 annual dues. After the first year the dues are the only fees the law will require. This change is made—from $5, the present cost to non-residents, to $10—to justify more effective protection. The Game Association will also recommend to the Legislature now about to meet a few other changes in the original law. One of them will be to require non-residents who hunt quail and rabbits also to license. At present the game laws extend equal privileges to non-resident land hunters with our own citizens. J. H. JOHNSON.

The Shooting License Idea.

THE shooting license idea is making headway. The license system was discussed at the meeting of the New York League in Syracuse last week, and at the meeting of the New York (city) Association for the Protection of Game on Monday night an amendment was considered providing for a shooting license requirement on Long Island. Another amendment suggested provides for a prohibition of the use of magazine guns as being too destructive of game such as quail and wild duck, the killing of which is facilitated by closely consecutive shots. Both of the proposals were referred to the executive committee of the Association for further consideration and action.

Big Game in Western Massachusetts.

LAST month Arthur B. Tirrell, of Plainfield, Mass., captured a big bob cat in one of his traps, which weighed 25 pounds, measured 34 inches from tip to tip, and stood 20 inches high. This is a rare visitor in the Hampshire Hills, and large of its kind. Wells, of Shelburne Falls, mounted him, and he is now on view as one of the town curiosities. C. H.

Netted North Carolina Quail.

CATFISH, N. C., Dec. 3.—*Editor Forest and Stream:* Birds are very scarce here, chiefly from excessive netting. Live birds are brought in for sale every day. Many of these, no doubt, go to stock covers elsewhere, but, of course, there is a heavy loss in transit. DRIVER.

Grown Up with It.

CAMDEN, N. J., Dec. 5, 1899.—Have read FOREST AND STREAM since a kid of eight years, and would not do without it for many times its price. W. B. S.

In Cuban Quail Fields.

HAVANA, Dec. 4.—*Editor Forest and Stream:* Two o'clock A. M. the morning looked lowery, threatening rain, but as the weather has lately been capricious, I, not wishing to lose my weekly day out, risked it to board the 6 o'clock train for a fifty-minute trip into the country to a station where I had been told the quail were numerous in the adjacent fields. About 7 o'clock I had left the train and taken to fields I had not before traversed, buoyant with lively expectations of a good day's sport. The clouds had cleared off and the sun shone out in cheerful welcome to the fields of the most luxuriant vegetation, which also reflected upon us the same joyful spirit. Dash manifested a lively participation in the surrounding inspirations, and was diligent in the performance of his part of the day's enjoyment; but, alas! for human credibility, we traversed one field after another that was blank of the beloved colins. Having before had some experience in the fallibility of human information as regards abundance of game, I had prudently directed my course toward fields that were known to me in order that if it resulted that I had been misinformed I might retrieve the lost morning by a successful afternoon, although this is very seldom the best part of the day.

This prudence saved me from a complete debacle, for we (I and my customary Sancho Pansy) traversed nearly ten miles of fields well adapted for quail life, without raising a feather, arriving at a wayside inn, where we breakfasted at 11:30 o'clock, with nothing to show for our morning's tramp except a beautifully ravenous appetite, that made the country cooking the equivalent of Delmonico's.

After resting until 1 o'clock P. M., we again sallied forth to fresh fields and pastures new. For the first half-hour we again drew a blank; then finding a swollen creek in our pathway, we inquired of a passing rustic for a ford where we might cross. He informed us that we could only cross by retracing our steps about a mile to the turnpike road and cross by the bridge.

We thanked him, but assured him we were disinclined to that course, and would find a way of crossing lower down. Arriving at a country house on the bank, we were assured that as the river (so called here) was swollen, our only course was to return to the bridge; but seeing a pole about 12 feet long and as thick as my arm, lying upon the ground in the door yard and a bean pole of nearly the same length, I asked the farmer to take it to the river, assuring him I would cross upon it.

He reluctantly acquiesced, and we found a narrow place where the pole would span the creek, and strapping my gun to my back and planting the bean pole as near the middle of the stream as possible in about 7 feet of rapid current, I performed a circus feat of balancing over, although a sudden gust of wind took off my hat in midstream, and we had to fish it out with some difficulty some distance down the stream.

It was not so simple a matter to get Sancho across, but by stern use of authority I succeeded, and we proceeded on our way rejoicing at our triumph and had not proceeded more than 500 yards when Dash announced the first quail of the day.

I flushed a fine bevy and scored a right and left, bagging a fine pair of plump birds, and marked down the rest of the covey in thick grass in open field. At last I had before me the promise of compensation for the hard luck of the morning. Of those marked down, Dash was able to locate but five birds, and to my delight I scored five straight kills, and brought away seven of that bevy.

We then turned back and crossed to the other side of the public macadamized road, and after ranging several fields Dash finally made a stand, and arriving there I flushed a fine covey, consisting of perhaps fifteen quail, and if my luck was at a premium in that day I repeated the carumbola, as it is here called (R. & L.), and again we marked down the bevy, this time in a bushy pasture, in which Dash got in some fine work of trailing, etc. One of the best was the location of the bird after trailing at least 500 yards, and then locating his bird. I flushed it in open field and pulled in vain upon the two triggers of my hammerless. Alas! I had not pushed up the catch after putting in the last cartridges, and the quail went off laughing at both me and the dog, who gazed up at me in dazed wonderment as if to ask me what it all meant, as well he might.

But we then had a good field before us, from which Dash located and I flushed one after another, and increased our bag to fourteen quail and five misses, having expended but nineteen cartridges during this day's outing, arriving home in Havana at 5 o'clock P. M., tired and hungry, but well satisfied both with myself and my dog. At seventy years of age I find these outings to be "big medicine" for me, as substitute for articles of the pharmacy, and I often prescribe the same remedy for other persons that may be able to avail themselves of it.

DR. ERASTUS WILSON.

In the Maine Deer Country.

CAMP EUREKA, Lake Willinockett, Me., Dec. 7.—Here I am in the wilds of Maine enjoying my first deer hunt. Our party consists of three, and we are having a grand time. Deer tracks as thick as chicken tracks in a barnyard. One of the party, Elizur Thomas, of Highwood, Conn., shot his two deer to-day, which is pretty good, as it was our first day's hunt.

This camp is brand new, and is run and owned by Fred B. Spencer and Jewett Spencer—brothers. These men are experienced guides and excellent hosts. Their camp was built by themselves last summer, and is an ideal spot, just twelve miles from the railroad, but easily accessible.

There is 4 inches of snow, and indications point to more. We are praying it will come, as the last fall is one network of tracks. WILLIAM H. AVIS.

CHRISTMAS BOOKS.

Books have always been and are among the most acceptable of Christmas gifts.

The particular books advertised as FOREST AND STREAM Books are most fitting for Christmas gifts to a sportsman.

It invariably happens that we receive orders for Christmas books so late that it is impossible to supply the books in time for Christmas.

Order early.

Sea and River Fishing.

New York League.

Editor Forest and Stream:

The New York State Fish, Game and Forest League held its annual convention at the Yates Hotel, Syracuse, Thursday, Dec. 7. This League is the successor of the State Association for the Protection of Fish and Game, and is the recognized protective association of the State. It is in short a union of the representative bodies of sportsmen from different parts of the State, which have joined issues in a common cause. There are at present twenty-eight different clubs in the League, representing more than that number of counties, and an aggregate membership well up in the thousands. During its existence the League has recommended to the Legislature and secured the enactment of most of the principal laws for the protection of fish and game which are now on the statute books. Its work has been well done, and sportsmen as a rule are well satisfied with the existing game laws, if they can be properly enforced.

The convention this year was not quite so largely attended as it has been on some occasions, but the principal reason assigned for this is the fact that the game laws are in such satisfactory shape that the friends of protection have few changes to suggest. The attendance, however, was good, sufficiently large to indicate that there is no loss of interest in the objects for which the League exists. The discussions were informal, but earnest and pointed, and the proceedings throughout were characterized by that friendly and fraternal spirit which usually prevails in conferences of true sportsmen. The delegates all seemed to fully appreciate the fact that their interests were identical and a determination to act together for the common good was at all times apparent. In brief the convention was one of the most interesting and harmonious in the history of the League.

The clubs represented by delegates present were as follows:

Anglers' Association, of Onondaga County—Charles H. Mowry, Wm. E. Everson, Walter S. MacGregor, Geo. B. Wood, J. E. Bierhardt.

St. Lawrence River Anglers' Association, of Clayton—Wm. H. Thompson, A. C. Cornwall, Alexandria Bay.

Black River Fish and Game Protective Association—W. E. Wolcott, Utica; John W. Hicks, Oriskany.

Canandaigua Fly-Casters' Association—C. B. Lapham, F. G. Hulse, Canandaigua.

Honeoye Falls Fish and Game Association—Aaron Mather, Honeoye Falls.

Honest Fishermen's Club, of Seneca Falls—Ernest G. Gould, Seneca Falls.

New York City Fish and Game Protective Association—Robert B. Lawrence, Edward Thompson, New York.

Genesee Valley Fish and Game Protective Association—Thomas W. Fraine, Rochester.

Newark Fishing Club—B. J. Palmer.

Spencer Sportsmen's Association, of Lyons—W. S. Gavitt, Henry Killick, Lyons.

Niagara County Anglers' Association—G. W. Weaver, W. J. Jackman.

Fish and Game Protective Association of the Cayuga Lake Basin, Ithaca—Prof. H. A. Surface, Cornell University.

James Annin, Jr., of Caledonia, Superintendent of State Fish Hatcheries, and Geo. W. Strell, of Chicago, were present, and were elected honorary members.

The convention was called to order in the assembly room at the Yates shortly after 10 A. M. by Vice-President R. B. Lawrence, of New York. Mr. Lawrence said that the League had met with a serious loss during the year in the death of its President, Cornelius W. Smith, who was one of its most prominent and energetic members.

C. B. Lapham, of the Committee on Resolutions, presented the following, which were unanimously adopted:

Whereas, Cornelius W. Smith, President of our League, departed this life in this city on the 28th day of October, 1899, in the full vigor of manhood and in the meridian of his years, and,

Whereas, By his death this League has lost a capable and worthy presiding officer, an ardent and zealous advocate of the objects for which our League was formed, and,

Whereas, Our departed President, who was a true sportsman in every sense that word implies, gave liberally of his time and means to enhance the interests of our League, and,

Whereas, He had endeared himself to us all by his open, frank and manly ways and by his warm and generous nature, therefore,

Resolved, That this League has heard with sincere regret of the death of our President, Cornelius W. Smith.

Resolved, That we tender the members of his family our heartfelt sympathy in their loss.

Resolved, That these resolutions be published in the newspapers of this city and a copy furnished the family of the deceased.

Treasurer A. C. Cornwall, of Alexandria Bay, presented his annual report, which made this showing: Balance on hand, December, 1898, $90.18; received since that date, $15; total receipts, $105.18; expended, $50.02; balance on hand, $55.16.

Secretary Ernest G. Gould, of Seneca Falls, reported twenty-eight clubs on the list of League membership. Both reports were adopted.

C. B. Lapham, of Canandaigua, Chairman of the Legislative and Law Committee, reported that twelve changes in the game laws had been recommended, all of which came from the Onondaga County Anglers' Association. He thought that the other clubs in the League believed that the present game laws were about as good as it was reasonable to expect. The seasons have been made uniform as far as possible, and the majority of sportsmen are well satisfied with the laws. Mr. Lapham said that while he was in Albany, Senator Elon R. Brown, Chairman of the Senate Fish and Game Committee, told him that he intended to go through the game law and try and make it more simple and clear. He had also received a letter from Mr. Brown in regard to the matter. The latter did not propose to make important changes in the law, but there would be a gain in simplicity of expression. The speaker thought that when the changes had been made, the law would occupy about one-third of the space it now does. He had no doubt that when Senator Brown introduced the bill the provisions would be simpler, plainer and in a great deal better shape. Mr. Lapham said that the changes proposed by the Onondaga Association all related to a reduction in the amount of penalties, and were as follows:

Section 102—Which relates to unlawful devices and explosives in the waters of the State. The change proposed is to reduce the penalty from $100 to $50.

Section 104—Fishing through the ice in waters inhabited by trout, etc., forbidden. Present penalty for each fish so caught $10. Proposed penalty $5.

Section 105—Trout: close season. Present penalty for each fish illegally caught or possessed $10. Proposed penalty $5.

Section 106—Trout less than 6 inches in length. Present penalty for each fish taken or possessed $10. Proposed penalty $5.

Section 107—Trout, etc., not to be disturbed while spawning. Present penalty for each fish taken $5. Proposed penalty $10.

Section 110—Bass, pickerel, etc., close season. Present penalty for each violation $60. Proposed penalty $50.

Section 111—Black bass less than 10 inches in length. Present penalty for each fish illegally taken $10. Proposed penalty $5.

Section 142—Fishing through the ice in certain lakes. Present penalty $100. Proposed penalty $50.

Section 145A—Nets not permitted in waters inhabited by trout. Present penalty $60. Proposed penalty $50.

Section 149—Frost fish and whitefish. Present penalty $100. Proposed penalty $50.

Section 150—Fishing with nets and other devices. Present penalty $100 for first violation and $200 for each subsequent one. Proposed change, $50 for the first violation and $100 for each subsequent one.

Section 151—Nets to be licensed. Present penalty $100. Proposed penalty $50.

The changes proposed do not affect the several sections specified in any other manner than the reduction of penalties, as stated. That is where the sections also make it a misdemeanor to violate the law or where other penalties than those mentioned above are provided, no change in the existing statutes is proposed.

Walter S. MacGregor, of Syracuse, in advocating the adoption of the proposed recommendations, said that since the Onondaga Anglers' Association was organized twelve or fifteen years ago, he had acted as legal advisor for the local protector most of the time. "I find as a result of twelve or fifteen years' experience," said he, "that although we have a membership of 200 or thereabouts, all intelligent men, and we have tried to educate the public in the matter of fish and game protection, difficulty is still found in getting a jury to bring in a verdict in certain cases of game law violations. It is not always so difficult in cases where partridges and game fish have been illegally caught as it is where pike or pickerel have been taken. But ordinary men are reluctant to find a verdict of guilty of a misdemeanor, and to impose a fine of $100 for violation of a section of the game laws or a penalty of $25 and $10 for each fish taken where food fish are caught. I believe this has been the experience all through the State that juries are reluctant to bring in verdicts in such cases. We believe it is in the best interests of protection that the penalties be in a moderate sum. If we could enforce the penalties as they are, we would say that none are too severe; perhaps, but we have to take humanity as we find it, and would it not be better to have penalties which we can enforce?" The speaker told about two men who hauled a net and caught bass, and it was shown by two witnesses that they had done so, but the jury found a verdict of not guilty. Subsequently one of the men was conversing with a juror, and the latter said to him: "Don't you ever get caught in such a scrape as this again, or it will go harder with you." The juror afterward said: "If we could have found a verdict of $25 we would have done so, but we were not going to give a chance for them to be fined $100 or $200." "What we have proposed," said Mr. MacGregor, "is to cut the penalties right in two. I sincerely believe that if these amendments can be adopted it would add thousands of dollars to the receipts of the Fish and Game Commission, and make the enforcement of the laws much easier."

G. W. Weaver said that in Niagara county they had the same difficulty in getting verdicts, but he had never heard the reason assigned by Mr. MacGregor. The reason usually given is that men are afraid that their barns will be burned.

Aaron Mather thought that in Livingston county there might be difficulty in getting a verdict in certain cases if the penalty were 10 cents. At Hemlock Lake a net was destroyed and the owner was taken before a justice, who fined him $15 and his assistant $15.

Mr. Lawrence—Don't you think that a reduction in the penalties would tend to make more convictions?

Mr. Mather—In some counties it might, and in others it would not.

Mr. Lawrence inquired why it had not been recommended that a reduction be made in the penalties prescribed in Section 100, relating to polluting streams.

Mr. MacGregor replied that the section was a dead letter. It is very difficult to show that a substance turned into a stream actually kills the fish. He believed the section should be rewritten.

The section of the game laws regulating the size of nets used in catching minnows was discussed at some length. Mr. MacGregor understood that nets 6 feet long, such are are now permitted, were practically useless, and that larger ones were being used. He thought the present law was practically a dead letter, and it might be well to restore the law of 1898.

Charles H. Mowry, of Syracuse, said it seemed to him that this Section 145 was ridiculous. He read the section and added: "I don't know of a case where it is observed. I suggest that we recommend an amendment, going back to the old size of net, which was 40 feet long and 4 feet deep, to be used in any waters not inhabited by trout."

Mr. Mather—It is absurd to catch minnows in a lake with a 6-foot net, although it might be done in a creek.

W. H. Thompson, of Alexandria Bay—Perhaps this question of minnows interests the people of the St. Lawrence River more than any one else. The law was adopted so as to allow people who baited minnows near the docks to dip up a few. One man who took out a license for using a large net reported an income of $350 from minnow fishing. His net was 80 feet long and 6 feet deep. I would ask that the St. Lawrence reservation be excepted if the old law is restored.

Mr. Mowry—The St. Lawrence River and Long Island will both be excepted as not belonging in the State.

The matter was temporarily tabled.

Mr. Mather, of the Auditing Committee, reported that the records had been examined and found to be correct.

Mr. Mather said he had been told that there have been more men from outside the State than inside hunting deer in the Adirondacks this year. He inquired whether it would not be a good idea to make non-resident deer hunters pay a license fee.

Mr. Strell said that a non-resident license law was adopted in Michigan, Wisconsin, Minnesota, the Dakotas and some other States before one was enacted in Illinois. The object of the law is not to make it burdensome on hunters, but to keep tabs on them. A license is obtained from the county clerk and the hunter gives his name and address. There is a $10 license fee in each county. This puts a check on the market-hunter, who followed through the different counties. If a game warden meets a hunter he asks him to show his license. The hunter must have his license with him and produce it. Another point is this: If a man has to pay a license to go into another State to shoot he is apt to think he prefers to put his money into the propagation of game in his own State. We have a resident license law, but it is merely to keep tabs on the hunters.

Mr. Mowry—Do you know what the receipts for licenses amount to?

Mr. Strell—I understand that $28,000 was received in two weeks for non-resident deer shooting licenses.

Vice-President Lawrence called Mr. Gould to the chair and spoke briefly on the subject. He was a good deal surprised to learn that the amount of income for licenses was so great in Michigan. He was of the opinion, though, that as long as a person was limited to two deer in a season, and hunters from other States who visited the Adirondacks expended considerable money there, an amendment to the laws requiring non-residents to pay a license would receive very little indorsement. He believed that the guides and hotel keepers in the Adirondacks would be very sorry to have such an amendment suggested by the League. Mr. Lawrence then resumed his duties as presiding officer.

W. E. Wolcott, of Utica, said that he quite agreed with what Mr. Lawrence had said on the subject. In connection with the matter of deer shooting, there was another point which he desired to bring up. Judging from the great number of shooting casualties in the Adirondacks this fall, the speaker thought that there was more need of legislation to protect the hunters than the deer. He offered the following resolution, which was adopted:

Resolved, That it is the sense of this body that some measure should be taken, if any can be deised, to prevent the repetition of such a series of accidental shooting fatalities as characterized the recent deer hunting season in the Adirondacks.

A nominating committee consisting of G. B. Wood, W. H. Thompson and Henry Killick was appointed, after which, at 12:30 P. M., a recess was taken for luncheon.

When the delegates reassembled shortly after 2 P. M., Mr. Lawrence said his attention had been called to the action of the Governor in regard to better protection for deer in the Adirondacks, and he thought it would be fitting that the League should in some way manifest its approval. There are sixty-three counties in the State, and only thirty-five game protectors. In the Adirondacks the number of protectors is altogether too small to secure the proper enforcement of the game laws.

Mr. Lapham offered the following, which was adopted:

Resolved, That the New York State Fish, Game and Forest League in convention assembled do hereby approve and commend the suggestion of Governor Roosevelt as to the requisite efficiency of the game protectors, not only in the forest preserve, but also throughout the State, and unanimously indorse his determination that hereafter those officials should be appointed solely for their proved fitness for said positions, and that a copy of this resolution be sent to the Governor by the Secretary.

John W. Hicks, of the Black River Association, offered the following, which was adopted:

Resolved, That we do hereby express our unqualified disapproval of the practice of allowing State reservoirs which have been constructed at public expense for canal purposes, and stocked with fish from the State hatcheries, to be used for the convenience and accommodation of lumbermen to such an extent as to make them uninhabitable by trout.

It was decided to recommend that Section 145 of the game laws, referring to taking minnows for bait, be stricken out, and that the old provisions be substituted, leaving the law practically as it was in 1898, except that the penalty be reduced from $100 to $50.

W. S. Gavitt, of Lyons, moved that the Law Committee be instructed to draft a bill changing Section 100 of the game laws, so that it will accomplish the purposes for which it was intended, and to confer with Senator Brown in regard to the matter. This motion was also intended to carry with it an indorsement of what the Governor has recently said in regard to the subject. Carried.

Mr. Mowry said it was gratifying to note that in this convention of the League, which had met in Syracuse so many years in the interests of protection for fish, game and forests, there were so few amendments to the game laws now proposed. It is an indication that the League has accomplished good work and obtained results satisfactory to all, but there are other things which may be furthered, by united effort on the part of true sportsmen. The speaker believed that the League was strong enough and of sufficient importance to entitle it to recognition. He thought it ought to ask the privilege of naming a majority of the members of the Fish, Game and Forest Commission from the ranks of the League. Mr. Mowry said the Governor was a true sportsman himself, and he believed him to be in cordial sympathy with the interests which the League is striving to promote. "I understand," said he, "that there has been some talk of making a single-headed Commission. So far as some of the Commissions are concerned, this is all right, making the Commissioner responsible to the head. It is all right in the excise and insurance departments, one man is sufficient and competent to perform the duties. But in the interests which we represent, which include fish, game, forests and shell fish, no one man is competent to fully cover all. It seems to me we ought to ask the right to name the men to represent our interests. I do not mean

the shell fish. I do not think that any man here would get up and say he was competent to administer shell fish affairs. But we have one or two who understand forestry matters and several who know what is needed in fish and game matters. I propose that we suggest to the Governor the propriety of naming more than a single-headed Commission, and that we ask the privilege of naming a majority representing our interests, from among our members."

Mr. MacGregor was of the opinion that the League, the only one in the State which has devoted so much time and energy to the interests of fish, game and forests, might very properly try and impress on the Governor that it should be consulted in regard to the Commission.

Mr. Mowry thought the Governor, being a sportsman himself, was in a mood to consider suggestions along the line. The Governor has recently called the Commission down on its policy in regard to certain matters, and said it was ridiculous that protectors should be compelled to hire guides to show them around in the woods. His theory as to protectors is all right, and why should it not hold good as to the Commissioners who appoint the protectors? I believe we should call the attention of the Governor also to the fact that we need more protectors in the State, at least in the proportion of one for each county. We come together with honest hearts and good intentions for the purpose of protecting and propagating fish and game and preserving the forests, but we do not have adequate representation on the Commission. Now is the time for this Association to assert itself and make its position known. Mr. Mowry offered the following resolution, which was unanimously adopted:

Resolved, That a communication from the New York State Fish, Game and Forest League be forwarded to the Governor of New York State to the effect that it is the sense of this convention of representative sportsmen from all parts of the State, that this Association should have the preference in the naming of candidates for appointment as members of the Fish, Game and Forest Commission. That it is not expedient in our judgment to establish a single-headed Commission, from the fact that no single individual is competent or capable to administer the affairs of the different departments of fish, game, forestry and shell fish. These different departments require men with special knowledge of the requirements of propagation and protection in the several lines mentioned. No one man can be found who is competent to properly care for these diversified interests, owing to their wide scope. It is recommended that there should be additional protectors appointed to the extent of at least one protector for every county in the State.

The following officers were elected for the ensuing year: President, Robert B. Lawrence, New York City; Vice-President, W. E. Wolcott, Utica; Secretary, Ernest G. Gould, Seneca Falls; Treasurer, A. C. Cornwall, Alexandria Bay; Legislative and Law Committee, Walter S. MacGregor, Syracuse; Howard G. Wardner, Rochester; David Tice, Lockport; W. S. Gavitt, Lyons; C. B. Lapham, Canandaigua; Auditing Committee, Aaron Mather, Honeoye Falls; G. W. Weaver, Lockport; Thos. D. Lunt, Dunkirk.

Mr. Lawrence thanked the League for the honor conferred, and assured the members that he would do all in his power to increase the good feeling between the sportsmen of the State, and to further the interests of the League.

On motion of Mr. Kellick a vote of thanks was extended to the retiring officers.

Prof. H. A. Surface, of Cornell University, then addressed the League at some length in regard to fish and game propagation. He said in part: "For four years I have been giving time in the interests of fish and game near Ithaca. I believe that legislation should be based on a knowledge of the habits of the fish and game we desire to protect. The watchword of true sportsmen should be cultivation rather than protection alone, or rather cooperation. The object of our association in Ithaca is to increase the supply of fish and game. If we desire an increase, then we should study the causes of reduction and what we can do to prevent them. In many places the haunts of the ruffed grouse have been destroyed. The bird must migrate to other places, change its habits or perish." The speaker alluded to the introduction of English pheasants in this country, and said they had lived and thrived here. We should try and determine what kind of game bird can be introduced here after the grouse has gone the way of the wild pigeon, buffalo, etc. Thirty-seven years of legislative protection uncoupled with propagation has failed to increase the fish and game. While the present conditions are deplorable, would they have not been much worse but for the intelligent work of fish-culturists? There is not as much known about any fish in the State as there should be. We should know about the fish, their habits, etc., and the condition of the water. We should know the natural range of the fish and where they can be successfully grown. Is there an abundance of food for the fish introduced, and if not, can it be supplied? Prof. Surface exhibited several preserved specimens of the lamprey and a live dogfish, which he said were enemies of the fish in Cayuga Lake. Lampreys live by sucking blood from fishes, and they kill more than all the fishermen do. The lampreys should be exterminated, but how can it be done? They run up the inlets in May to spawn. I constructed a weir and killed 1,400 of them. Last spring we took 1,800 off the spawning beds with a hand net. As a result lampreys are now scarce in Cayuga Lake. For the propagation of fishes or the destruction of their enemies, we must have a knowledge of their habits. The new mode of culture will be to first introduce the natural food of the fish we desire to introduce before turning in the fish we seek to establish. We need the knowledge of the biologist.

The unanimous consent of the convention was asked and given for the consideration of a proposed amendment to articles of the by-laws. Articles 17 and 18 were amended so as to provide that each club shall be entitled to two delegates at the annual meeting, and that the annual dues shall be $5 for each club.

The Secretary was authorized to have 250 copies of the by-laws, as amended, printed.

It was decided to have a committee on biology to further as far as possible the interests of the League, and the following committee was named: Prof. H. A. Surface, Ithaca; W. F. Wolcott, Utica; Geo. B. Wood, Syracuse; James Annin, Jr., Caledonia.

Mr. Wolcott offered a resolution rqquesting each club in the League to urge the members of the Senate and Assembly in their respective districts to use their influence toward scuring an appropriation for the purchase of additional lands in the State forest preserve. Adopted.

Mr. MacGregor, Protector Worts and Mr. Wood spoke briefly in regard to the desirability of having fishways in the Oswego, Oneida and Seneca rivers, and a resolution was adopted asking the Fish, Game and Forest Commissioners to provide proper fishways. The subject of eel weirs was referred to the Law Committee to take such action as it deems advisable.

Mr. Gavitt moved that the League recommend to the Legislature that a biological station be established in this State similar to that in Illinois. Adjoured.

W. E. Wolcott.

Utica, N. Y. Dec. 9.

Merrimack County League.

Concord, N. H., Dec. 6.—*Editor Forest and Stream:* Several of our members have been much interested in your editorials about the sale of game, so I take the liberty to send you under another cover a Concord paper with an account of our eighth annual meeting.

Chas. B. Clarke.

The eighth annual business meeting of the Merrimack County Fish and Game League was held in the banquet room of G. A. R. Hall last evening and was attended by a good representation from the membership.

The meeting was called to order by President Battles, who, after a few introductory remarks, called for the annual report of Secretary Clarke, who read the following, which was unanimously adopted and placed on file:

To the President and Members of the Merrimack County Fish and Geame League:

Gentlemen: I gives me pleasure to present this, the eighth annual report of the business transactions of this league.

The executive committee have held meetings on the second Monday of each month (except during the summer), which have been well attended.

During the year we have admitted five new members, and have lost by death two of our most valuable and influential members. I refer to Commodore George H. Perkins, of Webster, and Postmaster Walter H. Stewart, of Franklin, the latter being secretary of the Webster Lake Fish and Game League.

We have received and distributed during the year fry, fingerlings and yearlings as follows:

May 9—20,000 brook trout fry from the New Hampshire fish hatchery at Plymouth, of which 10,000 were planted in Bog Brook, Bow; 5,000 in Dolfe Brook, Hopkinton, and 5,000 in Ash Brook, Concord.

May 20—20,000 lake trout fry from the New Hampshire hatchery at Bristol, which were planted in Penacook Lake, Concord.

May 20—225 yearling brook trout from the United States fish hatchery at St. Johnsbury, Vt., of which 125 were planted in Farrington Corner Brook, and 100 in White Rock Brook, Concord.

Sept. 14—4,000 landlocked salmon yearlings from the United States fish hatchery at Green Lake, Me., were planted in Penacook Lake.

Nov. 7—300 white perch yearlings were purchased by the league and planted in Penacook Lake.

The past season has been one of the best in years for brook trout in this vicinity, and although the drought of the past fall has undoubtedly killed some in the smaller brooks, the commissioners have laid down an extra quantity of eggs this fall to restock the brooks and make up the loss.

During the summer months partridges were very plenty, but when the open season came on, Sept. 15, they were scarce and very wild.

This scarcity, I think, is caused by the pot hunters, who catch them with snares and traps, and the market-hunter, who spends all his time in hunting them, and smuggling them into Boston markets. Several of these so-called sportsmen, more properly called exterminators of game, have been caught and convicted through the untiring efforts of our efficient commissioner, Mr. Wentworth, of Hudson Center. It is impossible to stop it entirely.

The sportsmen of Massachusetts are making a great effort to stop the sale of game in markets, which is killed in that State.

Then why do not we, as sportsmen of a sister State, try and stop the sale of game in our markets?

Our law now forbids it being sent out of the State, and if these men who shoot and snare for the markets now do not have an easy market for their game they will, I think, find other employment.

Deer are quite plenty around Concord and in the adjoining towns, and with the exception of one or two being killed, are not molested. I find farmers in general are much pleased with seeing them around their farms, and in talking with one a few days ago, who took pains to call and tell me there were three near his place, he said that rather than have one of them killed he would substitute a cow.

Quail have been seen in flocks of ten to thirty within a few miles of this city, and some sportsmen have shown their true sportsmanship by not molesting them when they have seen them. It is proven that they will live in our climate, and in a few years, with buying a few dozen each year, we should have good shooting.

The Mongolian pheasants which have been liberated by the league are reported to be multiplying in certain localities around here. Several flocks have been seen by local gunners this fall, which should encourage us to put out a few pairs each year.

I wish to extend my thanks to the president and executive committee for their kindly co-operation at all times.

Respectfully submitted.

Chas. B. Clarke, Secretary.

The treasurer, Moses Ladd, presented his report, which showed the league in a fair condition financially. This report, also, was adopted and ordered placed on file.

Numerous remarks were made relative to the best locations in the county for the further planting of fry. This subject brought out considerable discussion of a nature which will undoubtedly be beneficial to the work of the league.

President Battles expressed a desire that game birds should also be considered, as there were hunters as well as fishermen in Merrimack County. He asked that the executive committee be authorized to purchase, if they saw fit, $25 worth of Western quail to be liberated next spring. On motion of Capt. Newhall the committee was so instructed.

A committee of three was appointed by the chair to select a list of officers to be voted for to serve during the ensuing year. The committee made the following report, and these officers were elected by a unanimous vote:

President, D. B. Newhall, Concord. Vice-Presidents, John M. Hill, Jacob H. Gallinger, Henry McFarland, Concord; W. H. Thompson, Pembroke; Samuel N. Brown, Penacook. Secretary, Chas. B. Clarke, Concord. Treasurer, Moses Ladd, Concord. Executive Committee, Harley B. Roby, Frank S. Moulton, Frank Battles, William Horner, J. H. Morris, H. E. Conant, Dr. G. H. Parker, Ira C. Evans, Dr. I. A. Watson, Chas. P. Webster, A. B. Cross, S. S. Ford, John P. George, Concord; R. D. Morse, David Dudley, Penacook.

The subject of a banquet was brought up and the executive committee was instructed by a vote of the league to make arrangements for a banquet in the near future. It is intended that this event shall take place before the close of the game season, and that the tables shall be bountifully provided with the appetizing fruits of the chase, as well as the delicacies of the culinary art.

Harley B. Roby was given a vote of thinks for the use of his office by the executive committee during the year past, as were also the retiring officers for their painstaking and efficient services during the period of their incumbency.

The Trout of Mountain Streams.

Is there anything in existence more charming, more beautiful, more replete with the harmonies of woodland, than the splashing, gurgling, joyous, swiftly flowing brook, its waters ever redolent with the chill of snow-clad hills, ever sparkling in its cold clear purity? Now its course dashes over rocks, that break into frosting foam the wealth of never ceasing waters. Again it spreads itself into a soft flowing stream, as it twines in serpentine coils through meadows. Then, bending bush growth bedecks its borders. Onward, ever onward it rushes, until lake or ocean welcomes its coming. Here is indeed the fitting nursery for the development of that rainbow spotted, restless, clever young life we know and love to call the trout. Even the tiny specimens that scarce seem as large as the line, show the characteristics of the race. Their birthdays alone mark increase in weight, agility and keenness. Erratic in every mood are these fish, from the birth to the death. No man has learned, none will ever know, how to account for their various tendencies, which overthrow all reasonable theories, or manage to put together a menu card that will always excite their appetite. Generations of lovers of the sport come and go, and yet the question never is settled, and for this very reason will these illusive specimen of the finny tribe, always remain a joy to the true sportsman. Much has been written, much more will be written, by able admirers, and yet the humble attempt of the individual may be excused, when zeal of admiration is the incentive.

Many and varied have been the means and devices employed in the capture of these royal beauties. In boyhood, when financial embarrassment was a ruling factor, a common hook and line, a pole cut from the young tree, and a large worm were enough to give joy to lads who even then became skilled in finding out the shady places, the deep pools and other cunning hiding spots; or with the shortened line could crawl near to a narrowing brook and carefully, softly drop the bait, and one would quickly be taken before the biter realized it was not a simple dainty morsel, and so became a captive. While perhaps the charm, the freedom and enthusiasm of this procedure never lose their fascination, yet as one grows older, with a keener wish for more arttistic skill, the interest is heightened by more delicate methods. In early spring-time, alluring artificial little flies are not the tempters that later in balmier air they become; and productive of better results is the small line bait, a worm and a single hook, or at times, a worm caught up by a set of three of the smallest hooks, on one gut, at intervals from each other, giving the worm an appearance as if he were crawling through the water, and good sport in the taking of a fish, as only one of the small hooks can hold him.

As a rule, a cast ahead is made, as the stream is waded. How almost unconsciously is picked out what appears to be favorable resting localities. How careful one becomes in the approaching, how careful not to disturb and to be sure to be well hidden, for no fish swims that can so readily and easily be startled into sudden flight as the trout, quietly lying in the deeper water where the shadow of the rock gives protection, or where tall grasses sway a feeling of security about him. Casting is done so that the bait drops without any noise into the right spot, whether the wading be up or down stream. Many people have decided views about this matter, but in reality the extreme care used is the important factor. In quick, splashing streams where at the foot of a hillside run the stream quiets in intensity, flies can be cast, into the seething froth itself, and receive marked attention, even if the fisherman stands on some stone that gives a sure foundation. Another time, without being seen, the flies must be gently fluttered into a pool, where all will be taken well and the creel soon filled. A recollection of earlier days becomes vivid at this moment, where a shelf of jutting rock, deep in the water, gave a footing, a rest for my back, against the broad boulder, as I stood immersed to the hips in water, that to-day would be my death from its coldness. I snapped out side casts, until my basket could not contain another one of the little fighters.

In a stream not broadly stretched in its width it is better to use but one small fly, waxing the wings so it will remain on the surface; and often a sudden dash means the striking of a large fish, one requiring patience and skill before a landing is accomplished. One always finds that each and every trout born in these tumbling, chilling waters is full of fight to the last, and often they outwit all endeavors in the attempt to capture. In the broadening stream that, strengthened by additional supplies, grows proudly into something more like a river, where from the banks fishing cannot readily be done, the

silent, quick moving canoe can be made use of. As it glides on its way, one watches for either a deep pool, or perhaps is fortunate in locating a spring hole, where if the sun shines brightly an army of feeding trout can be seen. The canoe can be held quietly, protection gained from the growth of bushes or long grasses of the banks, and the place can be well whipped. The splashing of the trout that rise to the flies only seems to incite their comrades into a frenzy of biting, and excellent sport is the result.

Every section of fishing country abounds in such mountain streams all in a way different, each bordened about by purple hills, each one having a familiar look, each appealing strongly in the possession of inviting pools, rapid waters, still flowings where broader they become, and all abounding in the same marvelous dainty, strong, beautiful, fickle, elusive, tempting, wonderful and fascinating form of life called the trout. In the hours when the sun shines too vividly, or when the fish are not anxious for their feeding, come the charm and joys in the keen realization of the greatness and all satisfying gifts of nature. Before a fire, that has dwindled into hot embers on the sharpened joints of a prolonged branch are thrust some of the catch, that have been cleaned and are hard and cold. Beside their very cradle, they are transformed into such delicious morsels that the appetite craves nothing but a sufficient quantity. Perfection in food and fit for the gods, a stretch on the grass, after such a repast, the comfort of a good smoke, all seems too good to be real, and forgotten are the weary journeys, hardships, and all that may have annoyed, in the life of one perfect day like this. Body and mind rested and strengthened, a better feeling toward all humanity comes to us. No harm have we done, no suffering have we caused. Back to camp are taken only such a number of fish as can be put to use. The day has been well spent, and in slumber we dream again of the victories that skill and patience gave to us.

Lines to a Trout.

Oh, bit of dainty gorgeous birth,
That sprang from icy waters clear,
In restless searchings, far and near
Coloring gained, of untold worth.

Did rainbow lend to thee its charm,
Or sunset give thee rays, to keep,
And weave, when in the waters deep,
Or, were they stolen, from the dawn?

Oh, pretty thing, 'tis joy to look
Upon thee, lying, trembling still;
The waters near forsaken mill
Had ever been thy home and nook.

A tempter, resting on the stream
Lured thee on, eager for thy kill
By sportsman, stronger in his skill
Than thou couldst understand or dream.

In young strength, life was hard to yield,
The battling proved thee strong as steel,
Conquered by force of rod and reel
Thy death throes, seeking all to shield.

F. M. JOHNSON.

CHICAGO AND THE WEST

Carping Again.

I must carp a little carp again. The current issue of Munsey's Magazine is the cause this time, and the colored picture of two snowshoers on the front cover is the specific charge. If any one will look at the aforesaid picture, he will observe that the snowshoers, a male and a female, wear their shoe straps directly across the middle of the foot and not across the toe, where any snowshoe man knows it ought to go. Neither do these folk seem to know that the heel rises when one walks on snowshoes, for they seem pasted to the floor of the shoe, and the shoe pasted to the earth. This grieves me very much, and I wish Mr. Munsey would adjust it, by calling in the edition if need be.

The Biggest Bass.

I mentioned some time ago the very large small-mouth bass taken in November, 1898, in Mendota Lake, Wis. This fish weighed 8 pounds 10 ounces. Its owners had it lithographed and are doing a good turn of business selling the lithograph, life size, and a series of affidavits establishing the weight of this extraordinary fish. With each lithograph of the fish there goes the notary's statement and the signatures of several citizens of Madison, and to make all secure, the Secretary of State appends the great seal of Wisconsin to the statement that the notary is a good man and true and known to him to be a legal notary. All in all, I think this fish story is the most conclusive of any I have ever seen. There is no doubt about the bass, and to give an easy idea of its size, I may state that I laid my arm out over the lithograph, which is reported to be life size, and I found that the picture of the bass was as long as my arm. Now, when you have caught a bass as long as your arm it will be time for you to go after affidavits, and to enter the lists against this monster of the Madison Lakes.

These Madison Lake bass are peculiar in their way. They are thought to be the small-mouth, but they lack the markings of the small-mouth, and in color and in size of scales resemble very much the big-mouth. The largest specimens are usually taken late in the fall. Three of these bass taken on Oct. 26 were brought down to Chicago, and the three weighed 16 pounds here. It is a curious fact that, although these bass were taken in the late fall, just before freezing up time, they were all very full of roe, apparently about to be deposited. This is quite in contravention of the popular and scientific ideas of the spawning time of these fish. I can not say how general is this late retention of the spawn. It is perhaps but an individual case or so. I have myself taken a brook trout in early April on the Castalia trout stream which contained very well-developed spawn. Here are two exceptions to the general rules.

E. HOUGH.

480 CAXTON BUILDING, Chicago, Ill.

"House Hunting."

I HAVE lately sung the praises of FOREST AND STREAM in answering the question where to go and what to do in the summer holiday, viz., to the State of Maine or eastern Canada for hunting grounds, "far from the dreary sounds of crowded earth, the cries of camp or town," with a small tent or wigwam your sufficient shelter from sun or storm, the redskins your sure guides, fishing and shooting to your heart's content the things to do. How can I now, in view of this, preach "the gospel of relaxation" in a minor key?

I might say with advantage, in the words of Punch, to those who, having passed middle age, have had their share of sport in many lands, from hunting fox and hare in Merrie England to stalking moose, caribou or red deer in North America, and are now about to engage in the unprofitable and difficult pursuit of "house hunting" anywhere East or West—"Don't." Yet, if experience teaches, why should I withhold the result of experience if it be of any value?

There are those, too, who, like myself, belong to the small minority; men of leisure, who, in their day, have plied the laboring oar, and have, so to speak, "won their spurs"—the spurs of relaxation—by hard work with head or hands or both. Why should we not cater for them? The world is now before them, and in no uncertain sound comes the absolutely necessary questions of such a man in search of a hobby—a fad—a home—"where to go, what to do." You may own the best house in Fifth avenue, New York, or in May Fair, London; the thirst for fresh fields and pastures new comes upon you; you cannot say with George Riddlar:

Let fools go searching far and nigh,
We bides at home, my dog and I.

You may, as in my case, know by heart Canada and the Northern States; you wish to go further afield for your new and temporary home. You "run" through Europe, in search of what you want, with Cook's or Gaze's tourist tickets, but without their family nurse as a guide armed with Murray's "Guide" book. You find it too hot and conducive to fever in southern Italy in autumn. The mosquito (you know him by early experience) is heard, seen and felt in the Riviera, and the climate is relaxing. You try Switzerland, its mountains and valleys. Here you find a delightful resting place in autumn. It is, however, monotonous in its climate and pursuits in winter. The chief cities and towns of France, Germany, Holland and Belgium are only for those who like town life—not for the lover of forest and stream. The question still remains for the middle aged and man of leisure, "Where to go; what to do."

By chance you take up Rudyard Kipling's latest, and there you find, "For the man whose work is done go to England."

Nor are your troubles over when you fix upon Merrie England as your temporary home. You open a large correspondence with house agents from Land's End to John O'Groat's. You read diligently their books and pamphlets. Oh, what "word painters" are these house agents! How often you pack your portmanteau and take the morning train to see "the very thing to suit," as portrayed in the books of the house agent! You return with heavy heart, sadly disappointed. The "mansion standing in its own grounds," is a semi-detached villa, with imperfect sanitation, and a perfect view of your next-door neighbor's internal arrangements. The "walled-in fruit garden" has but one slender plum tree, with half a dozen sickly-looking plums thereon. The "well-laid-out flower garden" is grown up in long grass, with a poor specimen of the scarlet geranimum tribe feebly trying to force itself through. You are about to catch a train for the hundredth time at the whim and caprice of the house agent, and to the complete disarrangement of your digestive organs, when a friend and brother at your elbow says, "My dear fellow, you will never get what you want in that way; I have learnt by experience. You require system in your folly. Take a memo of requirements with you." And here it is. House hunting conditions necessary:

1. Supply of water. 2. Drainage. 3. Aspect of house. 4. Soil. 5. Gardens. 6. Lawn tennis grounds. 7. Stabling. 8. Gardens and conservatory. 9. Number and size of rooms. 10. Basement, if any. 11. Amusements. 12. Hunting, shooting, fishing, golf. 13. Distance from town, church, station. 14. Price of coal, meat, forage, eggs, etc. 15. Price of wages. 16. Society. 17. Scenery. 18. Sea or river near. 19. Situation—healthy or relaxing.

Even when armed with these clear-cut instructions in pursuing to the end the game of house hunting we found that difficulties had by no means disappeared. Oh, for the technical education of the plumber, mason and carpenter respectively, as well as for the knowledge of the skilled architect and civil engineer, not to mention the training in endurance of the soldier, the practice of "how to keep your temper" of the parson. All this, and much more than this, as requirements, we found in our search.

How often we looked up and down, and shouted up and down the chimneys of the various houses to ascertain whether smoke was likely to ascend or descend. How often and how much we exercised our nasal organs to find out whether the drains, if any, performed their proper functions! How often we mounted a house roof and thus endangered valuable life in its examination.

The perfect house of our search is not the model dwelling—"type de maison moderne"—a palace, or that kind of residential hotel which the rich or those who imagine themselves rich sometimes foolishly build, chiefly for the benefit of others, with a smoking room got up in lapis-lazuli, or a Turkish bath with fittings of silver. No; our ideal, perfect, house is a dwelling place, which reasonable persons with moderate incomes could comfortably inhabit—of any style of architecture except the bad style, so constructed that "the winds of March could not whistle between flimsy layers of bricks linked by courses of porous mortar," nor the rays of midsummer's sun stab fiercely through its insufficient roofing. Its woodwork would be fitted so that yawning clefts did not appear in window frames or balustrades, nor would doors rattle on breezy days or jam on wet ones. That necessary equipment described by the householder as "the pipes" would give no cause for anxiety. And so on in detail.

At last, when fooled for the thousandth time by the over-zealous house agent, accident—mere accident, so-called—brought to our notice a fair specimen of the "perfect house" in the most picturesque part of England. Its situation remains a secret. All the requirements above referred to appeared to be in evidence. Cathedral and market towns within easy reach; four packs of hounds in the neighborhood, good neighbors in abundance, an ideal landlord. Here we settled down to rest and be thankful. Here we could draw a long breath and expand the chest under those enviable, apparently unattainable, circumstances, with "no more worlds to conquer." But our luck soon turned. Scarcely had we settled down than, with the eye of the landscape gardener, about to open a vista, and obtain a lovely view of a distant mountain, in removing some underbrush—Oh! with a big O—not so distant, at my feet, under my nose (both eye and nose were opened), a heretofore hidden cesspool is revealed. Pipes, drains and sanitation have vanished. That which much disturbed my olfactory nerves alone remains. Would that it would fly to the winds! My "type de maison moderne" has become a veritable harbor for groups of bacilli and germs of the worst kind. I am in despair, and if the skilled plumber and the ideal landlord—those rare mortals—had not appeared on the scene to relieve me in my distress. I should end these notes as I commenced them, with the advice, in answering the question "Where to go and what to do," to those about to take a summer holiday in the State of Maine or eastern Canada, not "don't," but "do."

MIC MAC.

U. S. Fish Commission Notes.

ADVICES dated Tahiti, Oct. 1, 1899, report the steamer Albatross in that harbor with all well on board. Rich collections from the interlying points are reported. Captain Moser has made some important hydrographical observations, and an extensive basin in the central Pacific, extending over thirty degrees of latitude, has been outlined and named in honor of the captain Moser Basin.

Whitefish.—In the Detroit River and the eastern end of Lake Erie there have been phenomenal runs of whitefish. The fishermen have made enormous catches, and the U. S. Commission will probably take 400,000,000 eggs of this important fish.

Trout.—Reports from New Hampshire and Vermont as to the condition of brook trout in the waters of those States are discouraging. Enormous losses of native trout, due to the severe drought that prevailed last summer, are reported. The work with landlocked salmon in Maine has been affected in the same way.

B. A. BEAN.

WASHINGTON, D. C., Dec. 4.

Through Rio Grande Canyons.

LANGTRY, Tex.—Prof. Robert T. Hill, of the United States Geological Survey, and four companions, arrived here last night from their perilous voyage through the cañons of the Rio Grande, their trip being the second successful one down the treacherous river ever attempted. The party left Presidio, Tex., over two weeks ago, and completed the 500 miles of the tortuous course of the river without seeing a sign of human habitation until they arrived here. The trip was full of adventure, and it is a wonder that the three boats were not capsized and all members of the party drowned while passing through the rapids which are found at frequent intervals in the deep and gloomy cañons. At some places the perpendicular walls rise to a height of several hundred feet, and the narrow channel through which the river flows affords no landing or resting place for many miles. At one place in the cañon there is a waterfall of 180 feet depth. It was with the greatest difficulty that the boats were lifted out of the cañon and carried around this fall.

Prof. Hill and the other members of the party are enthusiastic over the results obtained by the trip. They made a complete survey of the river, and the remarkable geological formations revealed by the rock walls of the cañon were closely studied. The cañon passed through the heart of fifteen mountain ranges, and all along the course is found mineral-bearing rock. In several places veins of silver and gold were found cropping out of the sides of the cañon walls and some of the members of the party are enthusiastic over the prospects of fortunes being made in developing these promising prospects.

There were positive indications found at several places in the almost inaccessible cañons that they had at one time been occupied by cliff dwellers, but it was found impossible to explore the ruins of these ancient inhabitants from below.

James McMahon, who is the only person known to have ever made a trip through the cañons previous to this Government expedition, was a member of Prof. Hill's party. But for his knowledge of the location of several dangerous rapids and falls the present expedition would have met with disaster. Mr. McMahon is an old trapper who has hunted beavers along the Rio Grande for many years.

Prof. Hill secured over 200 good photographic views of the scenes in the cañons, and these will form a part of his official report. The survey of the course of the Rio Grande gives him a basis for the remainder of his work of surveying and exploring the great Bloody Bend region which is formed by the tortuous course of the river. It will take several months to complete the work.—New York Sun.

AS A CHRISTMAS GIFT.

THE FOREST AND STREAM—in a year's subscription—is an appropriate and sure to be appreciated gift for a father, husband, son, brother, cousin, uncle, nephew, or one's pastor, lawyer, pupil, teacher or friend. The giving will be for fifty-two weeks. And with the paper may well go, for this year's Christmas, one of the large engravings "Alert" (moose), "The Challenge" (elk), "What's That?" (antelope), "Listen" (blacktail deer), "Close Quarters" (Mr. Osthaus' painting of Ripsey on point). These are on plates 12½ x 19 inches, on paper 22 x 28 ("What's That?" is slightly smaller). Price of engravings $3 each, or by a special rate the FOREST AND STREAM for one year and any one of the engravings will be sent for $5.50.

Camp-Fire Flickerings.

"That reminds me."

Frogs.

It was down in New Brunswick. We were sitting out in front of our camp one evening talking with our guides, Barney and Tom. Barney was one of those talkative Irishmen with a low, plaintive voice. Tom was short and brisk in his speech, his words were few and to the point—he had once captained a crew of thirty men on a drive. Barney suddenly startled us with the remark, "It's curious indeed how those little frogs can cure consumption." "What's that?" roared the artist. "Oh, yes," said Barney; "it's quite true—indeed it is—and when we go out I will point out a man to you who took a great many of them. Yes, he was once a very thin, spare little man, but now he is very large and stout. Oh, yes, I have often caught them for him. I once filled a little tin pail with those green kind and he took them all; and do you know, there was quite a big one—as big as my thumb, see—and when he put it down his throat, do you know it stuck there for quite a time; but he finally managed to get it down. Oh, yes, they do wonderful good, those little frogs do; yes. You see, the way they do good is this: They leap from the stomach over into the lungs and eat up all the corruption." BEAVER KILL.

The Kennel.

FIELD TRIALS.

1900.

Jan. 22.—West Point, Miss.—United States Field Trial Club's annual trials. W. B. Stafford, Sec'y.

Feb. 5.—Greenville, Ala.—Alabama Field Trial Club's fourth annual trials. T. H. Spencer, Sec'y.

Continental Field Trial Club's Trials.

The Members' Stake.

THE Members' Sweepstake was run on Dec. 8. Besides members of the Continental Field Trial Club, it was open to members of the Eastern Field Trial Club. Entries closed on the night before the running. All winners of open stakes at any field trials recognized by the club were barred. Entrance, $10, divided 50, 30 and 20 per cent. Mr. Edm. H. Osthaus, the famous artist, donates a painting of the winner of first, and a pair of silver hair brushes, donated by Dr. J. Spencer Brown, was the prize of second place.

There were ten entries, and they ran in order as follows:

Hobart Ames' setter bitch Belle of Hard Bargain (Count Gladstone IV.—Daisy Croft), with S. Bradley's setter dog Gilt Edge (Count Gladstone IV.—Lillian Russell).

G. Nesbitt's pointer dog Rip (Young Rip Rap—Wild Joanna), with C. W. Keyes' setter bitch Pauline (Paul Gladstone—Lill Ray).

Edm. H. Osthaus' pointer bitch Mabel (Mainspring—Croxie Wise), with Theo. Sturges' setter bitch Vivian (Gath's Mark—Gossip).

Theo. Sturges' setter dog Lonto (Antonio—Laundress), with Edm. H. Osthaus' pointer bitch Ripsey (Rip Rap—Dolly D.).

H. Ames' setter dog Dooley (Tony Boy—Nellie C.), with C. H. Phelps, Jr.'s, setter bitch Agnes (Antonio—Nancy Hanks).

The judges were Messrs. Geo. E. Gray and Bernard Waters.

The winner of first, Gilt Edge, ranged well and with judgment. He found birds quite successfully, and was also a good performer on singles. His point work was marred somewhat by false pointing. On the whole, however, he ran an excellent heat.

Ripsey, second, was a strong bidder for first, and would have been first had the judges seen the point on a bevy which she made when lost from sight in heavy weeds, as is told at length in the heat in which it occurred. Her point work was cleaner, and she worked her ground with better judgment than any other dog in the stake. In working to the gun, she also excelled. She is a worker of great excellence.

Vivian and Belle of Hard Bargain, third, made a competition of mixed quality, good and poor.

The visitors present were the President of the club, Mr. Hobart Ames, North Easton, Mass.; Mr. Chas. W. Keyes, East Pepperell, Mass.; Mr. C. H. Phelps, Jr., and his sister, Miss Julie Phelps, and Mr. Theo. Sturges, New York; Mr. John H. Schumacher, Los Angeles, Cal.; Mr. Chas. R. Taylor, Providence, R. I.; Messrs. A. C. Peterson and John Bell, Homestead, Pa.; Mr. Geo. Nesbitt, Kingston, Pa.; Mr. S. C. Bradley and his daughter, Miss Elizabeth Bradley, Greenfield Hill, Conn.; Mr. Geo. E. Gray, Appleton, Minn.; Mr. Edm. H. Osthaus, Toledo, O.; Mr. C. E. Buckle, Charlottesville, Va.

Friday, Dec. 8, First Day.

The weather was clear and cool in the morning, growing warmer as the sun mounted higher.

First Round.

Belle of Hard Bargain and Gilt Edge started at 9:20. They ranged merrily and wide. A bevy was seen to flush, both dogs in its vicinity at the time. On the scattered birds, each got two points. Sent on, Belle pointed a bevy in woods, and at the same time in the open some 200 yards away Gilt made a false point. Sent on, Gilt pointed a bevy in open sedge. Each next made a point on a single. Belle pointed a single, but moved on and the bird flushed. Sent on again for another bevy, Gilt made a false point. Belle, while fast and wide, lacked judgment in her range. Gilt was not so wide a ranger, but had the better judgment in beating out his ground and in his point work.

Rip and Pauline started at 10:34. Pauline was not well acquainted with her handler, and refused to work for him, so was withdrawn. Rip went on alone. He flushed a bevy, and made an indifferent showing on the scattered birds. Up at 10:59.

Mabel and Vivian were cast off at 11:06. Soon Mabel flushed a single in open stubble, then held a point on the rest of the bevy, but was unsteady to wing. Vivian backed prettily. Sent on, Mabel pointed in the open field, moved on to locate and lost the trail. Vivian roaded nicely to the bevy and pointed it, and Mabel backed, but at the flush and report of the gun she broke shot. Sent on. Vivian was found pointing a bevy. Some indeterminate work was done on other birds, Vivian finishing by dropping on a point on scattered birds. Vivian showed good range and bird work. Mabel ranged well and showed an intelligent purpose in beating out her ground, but her unsteadiness marred her work. She is ten years old, and a great bird finder. Her owner considers her age and does not care to punish her for her peccadilloes, she being so excellent otherwise. Up at 12:09, and the party went to lunch.

Ripsey and Lonto started at 1:39. Ripsey took a cast over a stubble field, and being absent some time a search was made for her. As Mr. Osthaus walked along the edge of the stubble he flushed a bevy in the thick weeds, and Ripsey came out of the weeds close by, where she had been on a point all the while. The judges unfortunately were elsewhere looking for her, and did not see it. A bevy find would have put her in first place in connection with her other excellent qualities in pointing, backing and intelligent work to the gun. A bevy in the meantime had been marked down, and on the birds of it Ripsey made three good points, while Lonto flushed and chased twice. Lonto pointed and Ripsey backed, and a single was flushed behind them after they moved on. Up at 2:17. Ripsey was the better in every way.

Dooley and Agnes started at 2:24. Dooley started off with great dash and soon wisely pointed a bevy in open stubble, Agnes backing nicely. Dooley was a bit unsteady to the rise. On the scattered birds in sedge in pines, each made a point and a flush. There were plenty of birds scattered about, and the work fell far short of the opportunities. Dooley finished with a single bird point and a false point, while Agnes also pointed and nothing was found. Up at 3:07. Dooley fell off in speed and dash as the heat progressed, while Agnes had but middling range throughout.

Second Round.

There were four dogs retained in the second series.

Belle of Hard Bargain and Vivian were cast off at 3:25 and ran till 4:05 without finding, though they worked diligently. The next brace was called, and after it was ordered up, Belle and Vivian were again put down. They were cast off at 4:52. Belle pointed a bevy, but drew on up to it unnecessarily close. The judges could not see how the case stood when the birds flushed. Belle apparently had the point, but she had drawn in unnecessarily close. Sent on. Belle flushed a bird willfully and then flushed the rest of the bevy; Vivian was close up and showed no signs of recognizing scent. Up at 5:04.

Ripsey and Gilt Edge were cast off at 4:10. Gilt pointed a bevy and Ripsey coming up on the other side of some cover from Gilt, pointed too. Sent on, in a moment Gilt began roading and drawing, and pointed another bevy. The scattered birds were followed. Ripsey made three good points and Gilt two. This finished the stake. Up at 5:04. The work of Ripsey had the better finish. Gilt, besides working well, was lucky.

The dogs were placed as follows: First, Gilt Edge; second, Ripsey; third, divided between Vivian and Belle of Hard Bargain.

The Alabama Field Trials Club.

THE fourth annual field trials will begin Feb. 5, 1900, at Greenville, Ala. Open only to Alabama owned pointers, English, Irish and Gordon setters. For all stakes, pointers and setters will run together and must be handled by owner or other amateur resident of the State. Trials will begin with the Derby Monday, Feb. 5, 1900, followed by the All-Age and Champion stakes.

Judges: W. B. Hamilton, Columbus, Miss.; H. H. Mayberry, Birmingham, Ala.

Programme.

Derby.—For pointers and setters whelped on or after Jan. 1, 1898. Entries close Jan. 10, 1900, with $3 to nominate and $2 additional to start. Winner of first gets 50 per cent.; second, 25 per cent.; and third, 15 per cent. Dogs having won first in any open field trials are barred.

All-Age.—For pointers and setters of any age. Entries close Jan. 10, 1900, with $3 to nominate and $2 additional to start. Winnings same as in Derby. Dogs having won first in any open field trials or first in the All-Age Stake of the Alabama field trials prior to Sept. 1, 1899, are barred.

First forfeit of $3 must accompany each nomination and be remitted to secretary on or before Jan. 10, 1900, for Derby and All Age stakes.

Champion Stake.—For pointers and setters of any age and regardless of previous winnings. Entries close Jan. 10, 1900, with $5 to nominate and nothing to start. Winner gets $50 silver cup and his dog the title of State Champion.

Forfeit money for Champion Stake must accompany each nomination and be remitted to secretary on or before Jan. 10, 1900.

Balance of entry fee in Derby and All Age ($2) must be paid before or at time of drawing, which takes place night previous to running of stake.

Entries to Champion Stake must fill the night before running.

Running.

This being an amateur organization, pure and simple, the running rules are modified to meet the requirements of shooting dogs, and amateur handlers and the judges are requested to bear this fact in mind.

The first heat of the Derby and All Age stakes will not be less than 30 minutes, following heats at discretion and discretion of the judges.

The first heat of the Champion Stake will be of one and a half hours' duration; following heats at discretion and direction of the judges.

Information for Owners, Handlers and Judges.

The club desires those competing at their trials to show their dogs to the best advantage, and not hustle for points on scattered birds, assuring them that each dog will be given a thorough test, both as to his finding and pointing qualities.

The number of times a dog points, backs, etc., shall not necessarily be given the preference; but the quality of the performance will be considered in connection with the frequency of the occurrence.

The judges will give greater credit to dogs showing the best natural qualities, it being the desire of the club to have the best dogs placed to the front, irrespective of the luck which is supposed to attend competitions of this nature.

The judges will be requested to give more attention to a dog's natural finding qualities than has been done in the past years, viz.: Intelligent ranging; desire to find birds independently; bird sense and nose, or expressed in fewer words, dogs showing the greatest ability to find birds.

The judges are requested to give greater credit to the dog that works promptly, without noise or severity, and is obedient, prompt, cheerful and easily handled.

The judges are requested in giving credit for backing to consider the manner in which the dog backs, giving greater credit for backing voluntarily.

Pointing fur, feather, reptile or scent of game birds, if the judges deem the same excusable, shall not be considered a false point.

False poingting, breaking in, breaking shot or chasing shall be gauged by the judges in their discretion.

All dogs should be broken to show to best advantage.

Definitions.

Breakin In—Is where a dog, through imperfect breaking, or from excitement, leaves his position when the birds rise, whether the gun is fired or not, and starts to chase, but stops within a few feet from where he started of his own accord or by command.

Breaking Shot—Is where a dog runs in when a shot is fired with the intention of getting to the bird, and does not stop promptly at command.

Chasing—Is where a dog follows the birds, either when a gun is fired or not, to any extent to be beyond the control of his handler for the time being.

Retrieving—Retrieving shall not be required nor considered in any stake.

Instructions.

Two persons are prohibited from working one dog.

An owner, his handler, or his deputy, may hunt a dog, but it must be one or the other, and when dogs are down an owner must not interfere with his dogs if he has deputed another person to handle and hunt him.

The person handling and hunting a dog may speak, whistle to and work him by hand as he may deem proper, but he shall be called to order by the judges for making unnecessary noise, or for any disorderly conduct.

An opponent's dog must not be interfered with. In such case an appeal should be made to the judges.

Dogs must be hunted together, and their handlers must stay within a reasonable distance of one another.

The privilege is granted handlers to ask the judges for information or explanation that has a direct bearing upon any point at issue; pending such questions the dogs shall not be under judgment.

Dogs affected with any infectious diseases will not be permitted on the grounds.

Handlers shall not load their guns until a point be established.

Alabama Sportsmen.

This being an amateur State organization, the sportsmen of Alabama should support it with their membership and dogs. Initiation fee, $1; annual dues, $2.50.

Object.

The object of the organization is to make and enforce laws for the protection and preservation of game.

The holding of field trials is for the purpose of improving pointers and setters by testing their field qualities and thereby increasing the interest in legitimate sport with dog and gun. These meetings foster good fellowship and social intercourse among sportsmen, which surely leads to greater refinement in the use of dog and gun, and more determined efforts to secure proper laws and aid in their enforcement.

The club will welcome the presence of ladies on the trial grounds, and it is hoped a goodly number will join us each day on this occasion. The sport is refined, exercise pleasant and riding easy.

Entry Blanks.

Application for entry blanks, or any other information furnished on request to the secretary, T. H. Spencer, Birmingham, Ala., to whom all correspondence should be addressed.

Greenville, Ala.,

Is located on the Louisville & Nashville Railroad, forty miles south of Montgomery, from which point there are four trains daily each way. The trial grounds are good and well stocked with birds. Hotel rates will be $1.50 per day, including noon lunch on trial grounds. Saddle horses $1 per day.

The L. & N. R. R. has given the club positive assurance of reduced rates, and connecting lines will very likely do the same.

Notice.

The annual meeting of the Alabama Field Trials Club will be held at Greenville on evening of February 5, 1900, for election of officers, admission of new members and the transaction of any other business.

By order of the president.

T. H. SPENCER, Sec'y-Treas.

DON'T SHOOT

until you SEE your deer—and see that it is a deer and not a man.

Points and Flushes.

The New England Kennel Club will hold a dog show under the American Kennel Club rules at the Mechanics' Building, Boston, on April 3, 4, 5 and 6, 1900. The following are the names of the dog show committee: Messrs. Samuel Hammond, J. M. Grosvenor, Jr., Robt. C. McQuillen, Chas. W. Keyes and David Crocker.

Yachting.

THE opening of a more direct passage from New York Bay to the sea by way of the East Channel, which is now under way, will work a certain change in yachting about New York, but another scheme has just been proposed which, if carried out, will have a still greater effect. The idea is to build a tide water ship canal between Jamaica Bay on the sea side of Coney Island and Flushing Bay on the Long Island Sound, just clear of Hell Gate. The ground being low between the two points, with the earth of a sort which is easily excavated, and with this earth available for filling at the ends and along the route, the plan presents no serious difficulties. If carried out, with a harbor at each end through the deepening of Jamaica and Flushing bays, it will open an immense area of water front for commercial purposes. So far as yachting is concerned, such a canal would offer a short, direct and easy passage between the sea and the Sound in place of the present way through Hell Gate and the East River, narrow, crooked, with strong tides and at all times greatly overcrowded.

IN connection with the Paris Exposition of 1900, a prize of $20,000, donated by Anthony Pollock, will be awarded for the best invention for saving life at sea in the event of serious disaster to a vessel.

IN addition to the new cutter on which Mr. Charles Day Rose has inflicted the particularly cumbersome and inappropriate name of Distant Shore, Mr. Watson has in hand a second design for a racing cutter, to be built by D. & W. Henderson, for an English yachtsman. Distant Shore, by the way, is comparatively a small boat, of about 80ft. l.w.l. and 20ft. beam, and very completely fitted below; the new yacht will be larger.

THE many yachtsmen who have enjoyed the stirring cruises of the several Falcons and Alerte, written by Mr. E. F. Knight, will sympathize with him in the sad mishap just reported from the Cape. Mr. Knight, who was in Cuba last year on a similar mission, went to the front in the Transvaal as the war correspondent of the London Morning Post, and was so seriously wounded at the battle of Belmont as to necessitate the amputation of his right arm.

SEVERAL of the silver cups won by the late James Ashbury have just been sold at auction in London. The cup won by Cambria in her race against Dauntless in 1870 brought £76, and that won by her at the R. V. Y. C. regatta of 1868 went for £53; the other trophies going at much lower figures.

WE learn from the Yachting World that the steam yacht designed by Mr. Watson for James Gordon Bennett will be a twin screw vessel of 2,682 tons, Y. M., her dimensions being 285ft. l.w.l., 39.9ft. beam and 24.2ft. moulded depth. The name proposed is Lysistrata. A sea speed of 17 knots is aimed at.

THE torpedo destroyer Bailey, named after the late Rear-Admiral Theodorus Bailey, U. S. N., was launched on Dec. 5 at the works of the Gas Engine and Power Company and C. L. Seabury & Co., at Morris Dock, on the Harlem River. The new boat is one of three ordered by the Government in 1897, a second one being now partly plated beside her in the yard. She was designed by Mr. C. L. Seabury, designer of the steam yacht Kanawha II. and many other steam yachts, her dimensions being: Length over all, 205ft.; moulded beam, 19ft.; depth of hold, 13ft. 5in.; displacement on official trial, 235 tons; displacement in commission, 265 tons. The armament will include four 6-pounder rapid-fire guns and two 18in. torpedo tubes for Whitehead torpedoes. A speed of 30 knots is guaranteed.

A special train of some fifteen cars carried a large party of invited guests from New York. The arrangements for the launch were perfect, the vessel starting as the dog shores fell, and attaining a good headway, which was checked as her broad, flat stern met the water. She was christened by Miss Florence Beekman Bailey, a granddaughter of Rear-Admiral Bailey. The two handsome twin engines were shown under steam in the machine shop, with the boilers, of special Seabury design. The work on these two boats, in addition to the growing business in naphtha and steam yachts, has called for important additions to the plant, which is now very complete in both the hull and engine departments.

MR. AND MRS. C. OLIVER ISELIN sailed for Europe on Dec. 6, to be absent through the winter. Nothing more is known as to the plans for Columbia's future racing.

Dixon Kemp.

WE have already made mention of the death of Mr. Dixon Kemp, yachting editor of the Field, which took place at his residence in London on Nov. 20. Mr. Kemp was born in 1839 at Ryde, Isle of Wight, his father being an architect. As a boy he spent much time in sailing on the Solent in open boats, and later in racing yachts. He was educated for his father's profession, but when nineteen years of age he joined the Isle of Wight Observer as yachting reporter, later on assuming the editorship of the paper. In 1862 he was requested by the Field to report for it the Isle of Wight races, and in the following year he went to London to assume the post of yachting editor, which he held until his death. In addition to his work of reporting yacht races, Mr. Kemp, very early in his career, became interested in the study of models and the taking off of the lines of noted yachts, then little practiced, as the rule o' thumb builder still held full sway. After publishing many designs in the Field, in 1876 he completed his first book, the large quarto "Yacht Designing." This great work marked a new era in yachting, coming as it did at a time when the sphere of the yacht designer as distinct from the yacht builder had not yet received popular recognition. It at the same time impressed upon yachtsmen the importance of a knowledge of naval architecture and the application of its principles, and it set forth in a plain and practical manner the principles themselves. One important feature of the work was the collection of large plates of lines of the noted yachts of the day. In 1878 this book was followed by a smaller one, the first edition of "A manual of Yacht and Boat Sailing." In it the practical side of yachting was dealt with in the same thorough and exhaustive manner that characterized the first book. In 1885 the original book was greatly revised and extended, appearing under the new title of "Yacht Architecture," and covering a much larger field than at first. These books have grown until "Yacht and Boat Sailing" has reached the ninth edition, announced for next month, Mr. Kemp having finished the revision shortly before his death. "Yacht Architecture" reached its third edition in 1897. Two years ago Mr. Kemp published a smaller, but most useful volume, "An Exposition of Racing Rules."

The scheme of an association for the promotion of yacht racing when first mooted found an earnest supporter in Mr. Kemp, and when it was organized in 1875 it was largely through his efforts. From that date until 1897 he served the Yacht Racing Association as secretary. In 1877 he, in connection with Mr. John Harvey, induced Lloyds' Society to start the "Yacht Register," for the registering and classification of yachts.

When the late James Ashbury crossed the Atlantic in the schooner Cambria in 1870 to race for the America Cup, Mr. Kemp accompanied him, returning again in the following year on board Livonia. He was an associate of the Institute of Naval Architects and a member of the Council, and in addition to his work for the Field, followed the profession of yacht designer, turning out many yachts, both sail and steam.

Even at the present day, when technical instruction and information on yachting matters are within the reach of all who care to read, Mr. Kemp's works justly hold the first place. No better testimony of their merits is needed than the fact that, in spite of the many revisions and extensions, the latest editions adhere to the original scheme of each of the two works, and some chapters stand to-day as when first printed. Of all writers on the sport, there is none who has placed the yachtsmen of all lands under such obligations as are due to the author of "Yacht Architecture."

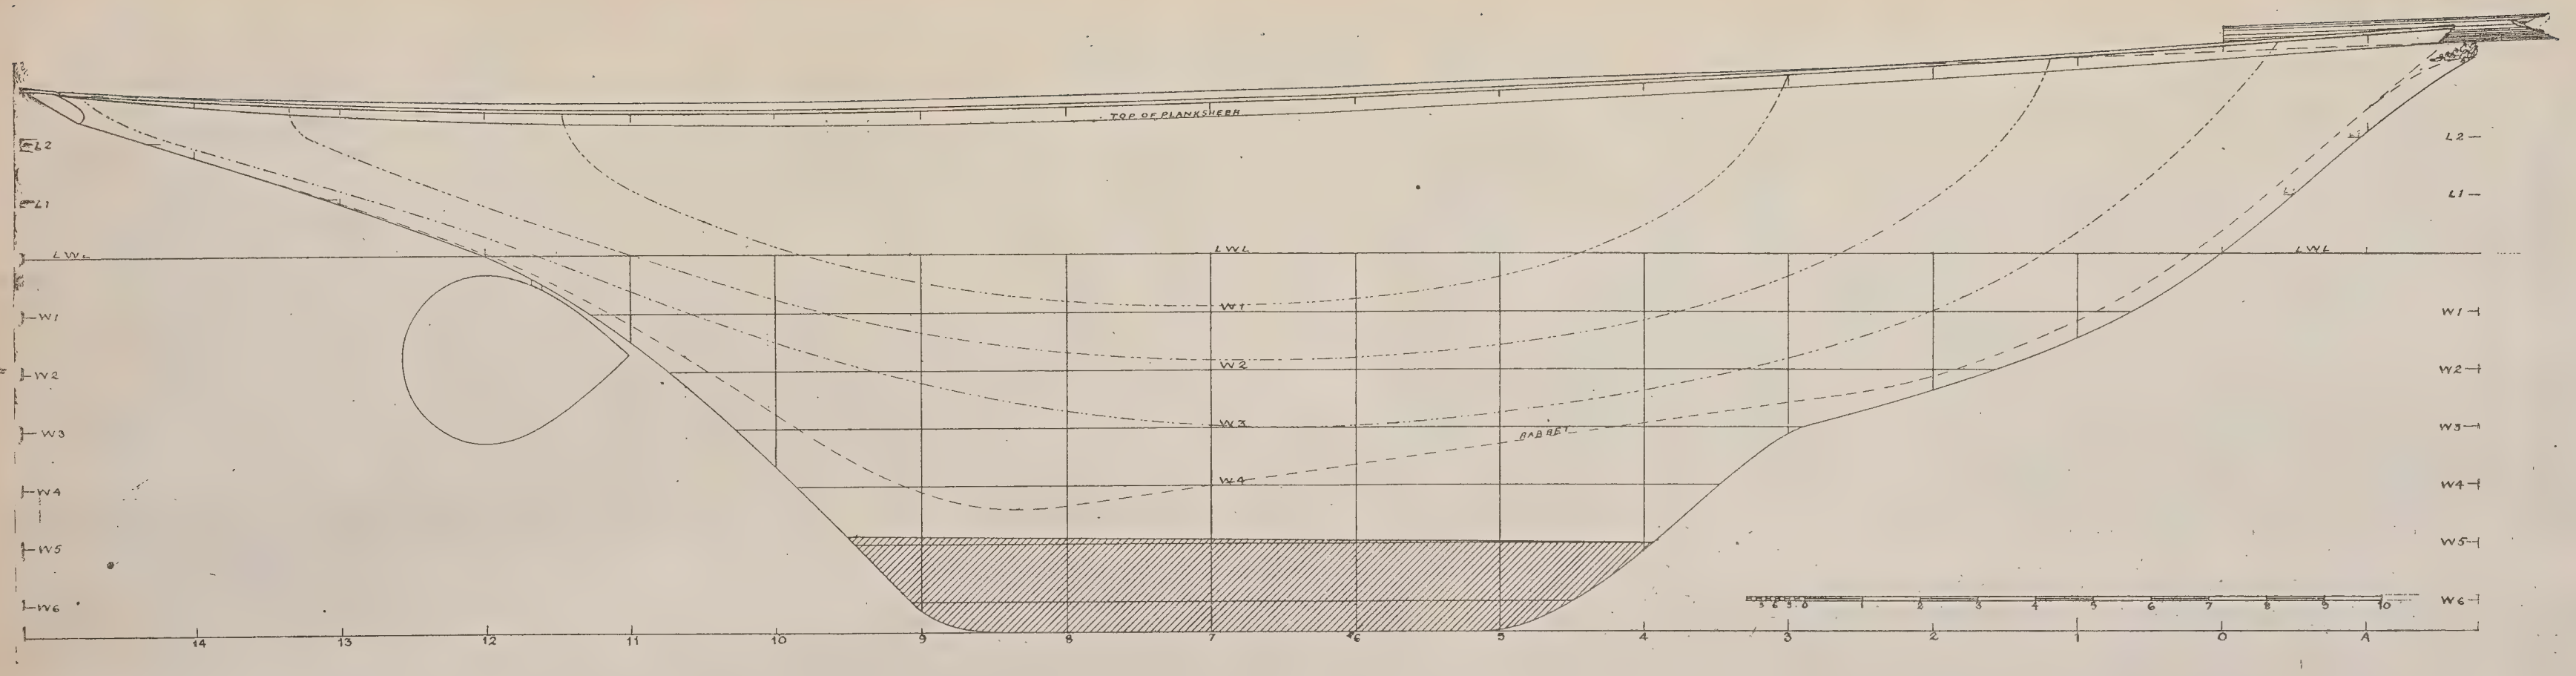
Audax.

THE keel yawl Audax, owned by Henry W. Eaton, Esq., of the Larchmont and Seawanhaka Corinthian yacht clubs, has been in commission for the past seven seasons on Long Island Sound, during which time she has fully proved her claims to the title of fast cruiser. The design, the joint work of Mr. Eaton and Mr. John Hyslop, is the result of a long experience on the part of each in small cruising yachts, and from a clear understanding from the start of the exact end in view, the production of a roomy and comfortably fitted yacht with sufficient speed to keep up in cruising with the average yachts of about her own size, and also to race in the 30ft. yawl class. As a cruiser the yacht has proved perfectly satisfactory, having as much accommodation as can well be condensed into a length of 30ft. with a small sail plan, and being remarkably easy in a seaway. Her cruising has covered the waters between New York and Martha's Vineyard, and she has at times been thoroughly tested in rough water. As a racer she has made a very good record in her class, and against yachts of similar type and build.

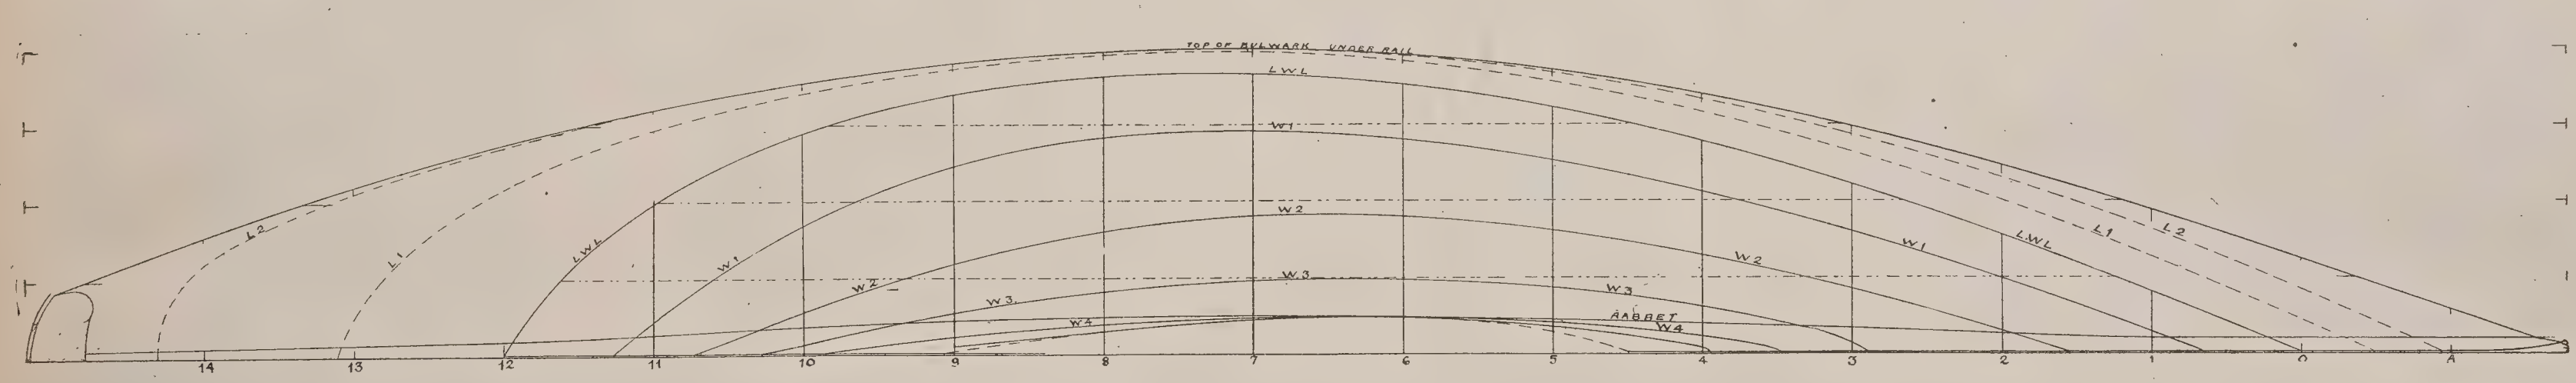
Beginning originally as a canoeist, Mr. Eaton has always favored the yawl rig. One of the first yawls seen about New York, the little Coquette, moored off Staten Island about twenty years ago, and then conspicuous as a novelty, was brought by him from England, and since then he has built several yachts, all under the same rig. Prior to building Audax, he owned the 30ft. cutter Rajah, well known about New York; one of the early cutters of moderate beam, designed by Mr. A. Cary Smith. After trying her thoroughly under the original cutter rig with topmast and full gear, Mr. Eaton in 1892 converted her into a yawl, with two pole masts and a modern and much lighter and simpler rig. The improvement was so marked that he determined to build a yawl of about the same size and accommodation. The opportunity presented itself of selling Rajah to a fellow yachtsman, whose aversion to the yawl rig was as pronounced as Mr. Eaton's partiality for it; so as the entire rig was new, the hull was disposed of and the rig reserved for the proposed new yacht.

The experience with Rajah showed just about what was possible in the way of accommodation, but her waterline was 32ft.; on account of the class limits it was desirable to make the new yacht but 30ft. on the waterline. The problem then was to design a hull of 30ft. l.w.l. that would give two separate apartments of over 6ft. length each, and full 6ft. headroom, with an additional space for a toilet room, and a good forecastle for one man; this hull to be driven at fair speed by a sail area of not over 1,250 sq. ft. The general requirements as to headroom, floor space, etc., being settled by Mr. Eaton, the design of the hull to fit the conditions was left entirely to Mr. Hyslop.

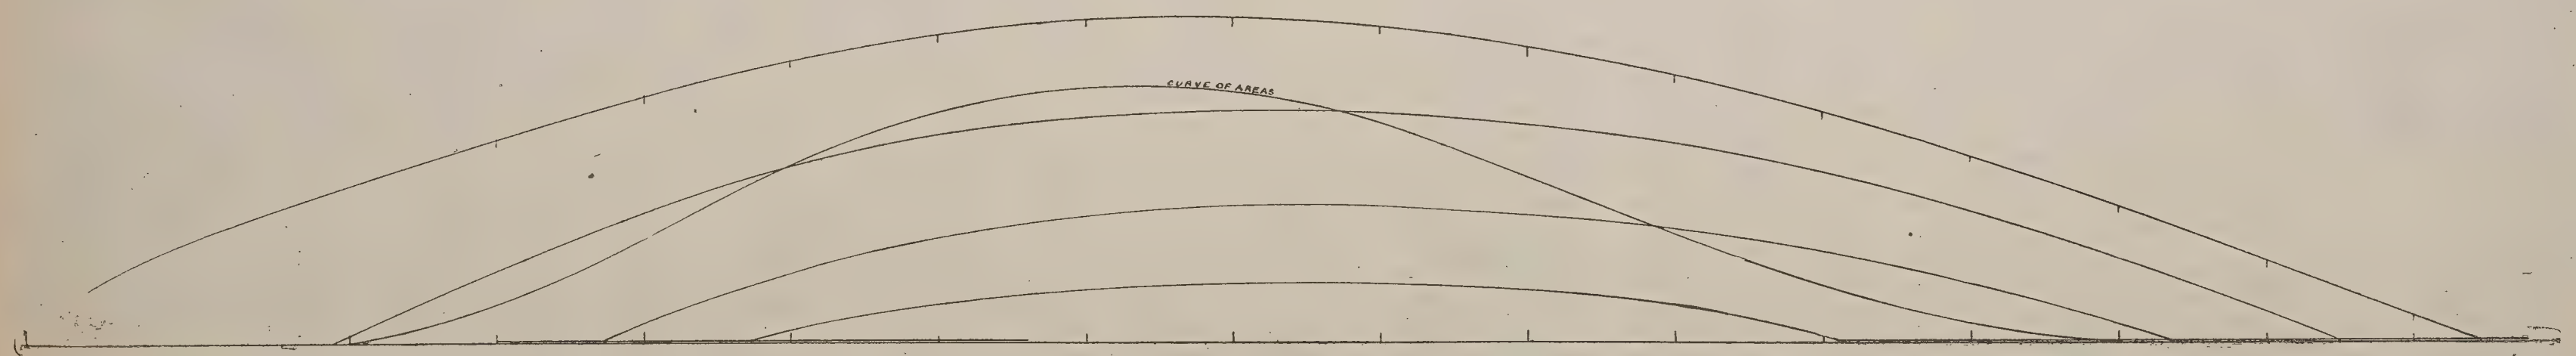
As the design took shape there was naturally a clash between the opposing qualities of accommodation and speed; in order to get a hull of sufficiently small displacement and fine form to be driven by the limited sail plan, Mr. Hyslop was forced to cut away the midship section to an extent which interfered with both footroom and headroom as roughly sketched by Mr. Eaton. The result of a good deal of careful thought and discussion was a most successful compromise, all superfluous bulk being cut away, and yet the required headroom and a reasonable breadth of floor being secured. While the exterior deadwood was freely cut away, Mr. Hyslop adopted an unusual keel contour for the purpose of securing a distant forefoot, and the keel itself shows a long straight on the bottom. The one freak feature about the yacht is the rudder, of the type then newly introduced on the fin-keel yachts and also tried on some keel boats. Mr. Eaton was anxious to test it, and the result has been fairly satisfactory; though it is a question whether the yacht would not be better with the ordinary cutter rudder on the raking sternpost.



In the construction strength was the first consideration; and though much care was taken to avoid unnecessary weight, nothing was sacrificed that could add to the strength and durability of the yacht. The building was done by Messrs. Read Bros., of Fall River, who turned out a perfectly satisfactory piece of work, strong in every detail and well finished.



At the start the yacht, with all her ballast, 5.4 tons in her keel, trimmed a little by the head; and 300lbs. of lead were stowed in the run. Later on this was removed and a piece of about the same weight was cut off the fore end of the lead keel, putting her in proper trim and still leaving ample stability.



The lines speak for themselves, showing a series of fair and artistic curves in the waterlines, bow-buttock lines and sections. Above water the hull presents a very smart and shipshape appearance. The construction plan, which will appear next week, shows a remarkable amount of room for a waterline of 30ft. and a midship section of but 23 sq. ft. with so fine a form throughout.

The dimensions and elements are:

Length—	
Over all	42ft. 6 in.
L.W.L.	30ft.
Overhang—	
Bow	4ft. 6 in.
Stern	8ft.
Beam—	
Extreme	10ft. 3 in.
L.W.L.	9ft. 5 in.
Draft	6ft. 6 in.
Freeboard to Top of Rail—	
Bow	3ft. 11 in.
Least	2ft. 6½in.
Stern	2ft. 11 in.
Displacement	10.43 tons.
Coefficient of displacement	0.529 ton.
Ballast—Lead keel	5.40 tons.
Ratio of balast to displacement	0.51 ton.
Areas—	
Midship section	23.00 sq. ft.
L.W.L. plane	192.64 sq. ft.
Lateral Plane—	
Without rudder	124.00 sq. ft.
With rudder	131.90 sq. ft.
Coefficients—	
Midship section	0.37 sq. ft.
L.W.L. plane	0.68 sq. ft.
Lateral plane	0.63 sq. ft.
Fore End of L.W.L. to—	
Midship section	16.50ft.
C.B.	16.00ft.
C.L.R.—	
Without rudder	15.70ft.
With rudder	16.50ft.
C.E.	16.17ft.

AUDAX, YAWL, DESIGNED BY JOHN HYSLOP, ESQ., FOR HENRY W. EATON, ESQ., 1892.

YACHTING NEWS NOTES.

The annual meeting of the Interlake Y. R. A. was held at Erie, Pa., on Dec. 2, Com. George T. Bliss presiding. The following officers were elected: Com., George F. Anderson, Sandusky Y. C.; Vice-Com., Otto F. Barthell, West End Y. C., Detroit; Rear-Com., E. P. Sharp, Buffalo Y. C. (secretary and treasurer and fleet captain to be appointed by the commodore); Fleet Surgeon, Bernhard Jacobs, Detroit Y. C.; Measurer, J. W. Hepburn, Toledo Y. A. Regatta Com., E. W. Radder, Cleveland; Joseph Farrell, Sandusky; Arthur Wendell, Detroit; W. R. Huntington, Cleveland, and J. Schoonmacker, Toledo. Entertainment Com., F. R. Frey, Toledo; Wm. J. Nagle, Detroit, and A. Gibson, Erie. Delegates to the Y. R. U. of the Great Lakes, F. B. Hower, Buffalo; E. W. Radder, Cleveland, and John Rathbone, Detroit. The annual meet of the Association will be held at Put-in-Bay, Lake Erie.

At Poillon's Yard, South Brooklyn, a schooner is under construction from the designs of Mr. J. Beaver Webb for Mr. Max Agassiz, of Newport. She will be of wood, 96ft. over all, 70ft. l.w.l.

Regina, yawl, has been sold by Dexter H. Warner to W. A. Hamilton, through F. B. Jones.

Alcaca, schr., has been sold by L. Vaughn Clark to an English yachtsman now residing in Germany, the sale being made through Messrs. Tams & Lemoine. The same firm has designed a cutter for Arnold Lawson, of Boston, to be 54ft. over all, 35ft. l.w.l., 13ft. beam, 8ft. draft, of composite construction with double skin. She will carry about 5 tons of lead and 2,000 sq. ft. of sail in a pole-masted rig with topmast, and will be fully fitted for cruising.

The Beverly Y. C. has re-elected George H. Richards Commodore and Lewis S. Dabney Vice-Commodore, with Lawrence Whitcomb Secretary and Treasurer, John Parkinson Measurer, F. E. Cabot, C. E. Hodges, C. H. Jones, S. G. King, J. G. Palfrey, E. M. Farnsworth, R. W. Emmons 2d Regatta Committee; F. L. Dabney, A. S. Hardy, F. W. Sargent, E. M. Farnsworth, Lawrence Whitcomb Admission Committee; Dr. E. S. Wood, A. S. Hardy, W. H. Emmons, Lawrence Whitcomb, W. E. C. Eustis House Committee; John Parkinson and C. H. Jones Counsel. The club voted to purchase the club house property at Wing's Neck from the Wing's Neck Association.—Boston Globe.

The New York Y. C. has negotiated a loan of $240,000 at 4½ per cent. on its new property, with the Equitable Life Assurance Society, the club having taken title to the property, which was purchased at a cost of $148,000 by Com. Morgan and presented to it.

T. W. Brigham, Morgan Barney, James W. Hussey and Frederick A. Poole, members of the Class of 1900 of the Massachusetts Institute of Technology, of Boston, were out on the steam yacht Freelance, from Greenport, Dec. 2, and made many tests for the thesis work of Mr. Brigham and Mr. Barney. They were accompanied by Prof. C. H. Peabody, of the Department of Naval Architecture and Marine Engineering, and M. Carl Clark, instructor in naval architecture. Mr. Schermerhorn gave the Government free use of the yacht as an auxiliary cruiser during the Spanish war, after which she was returned to him. In the morning several runs were made over the measured mile in Greenport Harbor, with the engines turning eighty revolutions, after which the speed was increased till they were running at two hundred and twenty revolutions. During these runs the students took data for obtaining the indicated horse-power of the engines, and the steam pressure, and speed of the boat. The party arrived early in the week and spent the Thanksgiving holidays here, returning yesterday afternoon. They were grateful to Capt. William Horace Vail and Chief Engineer Chesman Thorn, of the yacht, who gave them valuable assistance. Mr. Schermerhorn gave them the free use of the yacht.—Brooklyn Times.

The annual meeting of the Manhasset Bay Y. C. was held on Dec. 5, the following officers being elected: Com., Hazen L. Hoyt; Vice-Com., George B. Wilson; Rear-Com., G. Howland Leavitt; Sec'y, Edward MacLellan; Treas., George A. Corry; Meas., Charles D. Mower; Board of Governors, James Francis, Joseph R. Grismar and Horatio R. Harper.

Rifle Range and Gallery.

Iroquois Rifle Club.

Pittsburg, Pa., Dec. 4.—Following are the scores made by members of the Iroquois Rifle Club during the week ending Dec. 2. R. R. Bennett did himself proud by making a full score of 50 in the Beech cup event. Thanksgiving Day proved a profitable day for the boys who make a practice of shooting for turkeys. The total winnings of the six men who have reported so far were twenty-three turkeys and four ducks. The scores:

	No. 1.	No. 2.	No. 3.
O L Hertig	41 42 43 42—168	35 41—76	40 44 42 43—169
H L Born	44 41 36 42—163	.. ..	.. ..
R R Bennett	.. ..	37 39—76	43 45 42 50—180
R R Bennett	.. ..	42 41—83	44 45 43 40—172
A Hofmeister	.. ..	.. ..	39 40 34 34—145
J Bergmann	.. ..	.. ..	40 42 42 33—156

No. 1 was the medal match, No. 2 the record match, and No. 3 the match for the Beech cup.

Dec. 11.—Following are scores for week ending Dec. 9:

Medal match:

H L Born	39 41 40 44—164	L A Schmidt	33 42 35 31—141
	44 43 40 39—166	O L Hertig	44 38 39 46—167
B Kestner	38 39 40 43—160		

Record match:

W Riebling	40 40—80	B Kestner	43 37—80
	40 40—80		41 42—83
R R Bennett	37 43—80	L P Ottel	47 46—93
	42 43—85		48 50—98
	37 39—76	O L Hertig	40 42—82
L A Schmidt	37 43—80		

Cup scores:

A Hofmeister	40 38 41 43—162	R R Bennett	44 41 45 46—176
	44 39 41 40—164		40 39 43 43—165
	39 44 40 36—159		35 42 48 41—161
Sperling	43 45 47 40—175	L A Schmidt	33 42 85 31—141
	44 46 43 44—177		

Election of officers for the coming year will be held on Tuesday, Dec. 26, instead of Monday, 25.

Harry Sperling, Cor. Sec'y.

Cincinnati Rifle Association.

The above association held their regular shoot Dec. 10 at 200yds., off-hand, at the standard American target. Roberts was high on the honor target with 46. Gindele was high on the king target with 88:

King target:										
Gindele	8	10	8	9	9	9	8	10	9	8—88
Weinheimer	7	6	5	9	9	6	6	6	7	9—70
Topf	7	5	8	8	5	5	8	10	7	4—67
Nestler	6	9	6	7	7	8	4	7	7	8—69

Trapshooting.

If you want your shoot to be announced here send in notice like the following:

Fixtures.

Dec. 18.—Batavia, N. Y.—E C cup contest for championship at targets, between Messrs. W. R. Crosby, holder, and Fred Gilbert, challenger.

Dec. 19.—Dexter Park, Brooklyn, N. Y.—Open shoot of the Emerald Gun Club. Live birds. L. H. Schortemeier, Vice-Pres.

Dec. 31-Jan. 1.—Milwaukee, Wis.—Amateur tournament of the Wisconsin Gun Club. P. Himmelstein, Sec'y.

Brooklyn Gun Club.—Third Saturday of each month, Francotte gun contest. Fourth Saturday of each month, Grand American Handicap free-entry contest.

Watson's Park.—Burnside Crossing, Ill.—Medal contest the first and third Fridays of each month.

1900.

Jan 16-19.—Hamilton, Ont., Can.—Annual tournament of the Hamilton Gun Club; $1,200 in prizes. Open to the world. H. Hamilton Gun Club; $1,500 in prizes. Open to the world. H.

Jan. 17-18.—Danville, Ill.—Sconce-Cadwallader invitation shoot. Live birds and targets. John Parker, Mgr.

Feb. 13-17.—Hot Springs, Ark.—Third annual midwinter tournament; $1,000 added; 2-cent targets (Rose system) and live birds (high guns). Capt. A. R. Smith, Sec'y.

April 2.—New York Vicinity.—Interstate Association's Grand American Handicap. Edward Banks, Sec'y.

April 18-21.—Lincoln, Neb.—Third annual amateur tournament of the Lincoln Gun Club. Live birds and targets. W. S. Stein, Sec'y.

May 7.—Chicago, Ill.—Twenty-sixth annual convention and tournament of the Illinois State Sportsmen's Association. W. B. Leffingwell, Sec'y.

June 3-8.—Utica, N. Y.—Forty-second annual tournament of the New York State Association for the Protection of Fish and Game. Henry L. Gates, Sec'y.

June 5-7.—Columbus, O.—Ohio Trapshooters' League tournament. J. C. Porterfield, Sec'y.

June 11.—New York Vicinity.—Interstate Association's Grand American Handicap target tournament. Edward Banks, Sec'y.

Aug. 28-30.—Arnold's Park, Okoboji Lake, Ia.—Budd-Gilbert tournament.

DRIVERS AND TWISTERS.

In the absence of the Editor of this department all communications intended for publication should be addressed to the Forest and Stream Publishing Co.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have printed. Ties on all events are considered as divided unless otherwise reported. Mail allsuch matter to Forest and Stream Publishing Company, 346 Broadway, New York.

The programme for the grand Canadian handicap and tenth annual tournament of the Hamilton Gun Club is now ready for distribution. The tournament will be held at Hamilton, Ont., Can., on Jan. 16-19, 1900. The club guarantees $1,200 in prizes. The shoot will open on Tuesday, Jan. 16, with the grand Canadian handicap, at 20 live birds, $15 entrance, including birds, $600 in gold guaranteed. Purse divided: first, $125; second, $85; third, $65; fourth, $55; fifth, $45; sixth, seventh and eighth, $35; ninth, tenth and eleventh, $25; twelfth, thirteenth and fourteenth, $15. On this day there will also be five target events, all at 20 targets, $2 entrance. The second day's programme consists of a 10-live-bird event, $5 entrance, birds extra, 40, 30, 20 and 10 per cent. division, and five 20-target events, in two of which $50 is guaranteed. The third day's shooting will begin with a handicap at 10 live birds, $100 guaranteed, $5 entrance, birds extra; 30, 25, 20, 15 and 10 per cent. division. Then follow, same as on previous days, five 20-target events. The last day will be devoted to an open handicap, at 25 live birds, $20 entrance, birds included; $200 guaranteed, divided 30, 25, 20, 15 and 10 per cent.; surplus added; high guns. Miss-and-outs and sweeps will be shot to suit the shooters. Manufacturers' agents and paid experts may shoot for price of birds, but will not be allowed to share in prize money, excepting the $200 guaranteed, which is open to all. The surplus in this and No. 1 event will be added to purse. Two Canadians and one American will form a committee to arrange the individual handicap, which will run from 26 to 33yds. John Parker, of Detroit, will assist the management to carry out the numerous events to the satisfaction of all. H. Graham is secretary.

Mr. Arthur Robinson, of New York city, has been running in hard luck lately. Mr. Robinson is extremely fond of hunting of all kinds, and keeps a good kennel of setters and pointers. On Sunday Nov. 26, he had the misfortune to lose an Irish setter bitch that strayed away from his home in New York. On Dec. 1, while out after ducks in the Great South Bay, at Patchogue, he lost a gun overboard and was unable to recover it. To cap the climax, he received word from his kennels at Brewsters, N. Y., late last week, that one of his most valuable pointers had been poisoned. In consequence of the above three occurrences he has purchased a new gun and a brace of pointers, the latter from Geo. P. Finnegan, of Smithville Flats, N. Y.

Reports from Kansas City go to show that the shooters there have not yet got over their defeat at the hands of the Omaha team. A letter from a Kansas City shooter states solemnly that the boys sit around the stove and say but little. Vengeance, however, is meditated.

The annual target tournament of the Schenectady Gun Club will be held on Jan. 1, 1900, at Schenectady, N. Y. There will be twelve events, at 10 and 15 targets, alternately. Persons desirous of shooting for targets are invited to do so. V. Wallburg is captain of the club.

At a meeting of the Prospect Gun Club, of Brooklyn, held last week, the following officers were elected for the ensuing year: President, Wm. La Roche: Vice-President, Joseph Fallert; Secretary, Chas E. Hill; Treasurer, W. E. Banks; Trustees; F. J. Ashfield, C. T. Dotter and C. E. Snively.

We are informed that Mr. Thos. Donley, of St. Thomas, Ont., Can., who has just held a four days' shooting tournament at targets and live birds, intends holding a week's shoot at live birds in May, 1900.

Fred Gilbert has once more asked W. R. Crosby to change the date set for the E C cup contest, which has already been shifted once or twice. It seems now that Gilbert wants to attend John Watson's shoot at Chicago, so Crosby has changed the date from Dec. 16 to Monday, Dec. 18, on which day the match will be shot at Batavia, N. Y., at the time originally fixed.

The New Haven Gun Club announces a grand holiday shoot of the Wolves and Lambs to be held on the club's grounds on Jan. 1, 1900, to which all shooters are cordially invited. The programme is made up of ten events, aggregating 155 targets, and $8.85 entrance. Interstate rules will govern, and shooting will commence at 9:30 A. M. M. J. B. Savage is secretary.

One of the latest arrivals in this city is F. S. Parmelee, of Omaha, Neb., who arrived in New York on Saturday afternoon, Dec. 9. Parmelee will not make a long stay, but will move on in a day or two to Newport, R. I., returning to the city for another few days before starting for his home in the West.

The fourth annual tournament of the West Virginia State Sportsmen's Association will be held June 19, 20 and 21, 1900, under the auspices of the Charleston Gun Club, of Charleston, W. Va. From $500 to $600 added money has been promised, besides merchandise prizes. Announcements later.

IN NEW JERSEY.

Rahway Gun Club.

Rahway, N. J., Dec. 6.—The two days' live-bird shoot given by Pony Lambert, of the Rahway Gun Club, ended to-day. The original programme was not carried out on either day, but there was plenty of shooting, though there were not many shooters. The weather yesterday was cold and windy, and the birds were a very good lot. The first day's programme was to have consisted of a 5, 7 and 15 bird handicap, with miss-and-outs to follow. Instead there was a 5-bird handicap and seven miss-and-outs, the latter at 28yds. rise. The scores:

Bissett, 29	22112—5	10—1	21—2	0 —0	0—0	2—1	20—1	20—1
Belloff, 29	12012—4	0 —0	0 —0	22—2	2—1	2—1	10—1	20—1

Blodgett, 28	....	..	..	..	..	..	..	20—1

Second Day, Wednesday, Dec. 6.

It was originally intended to shoot to-day a 7, 10 and 25 bird handicap, and miss-and-outs. There were shot instead two 5-bird handicaps and eight miss-and-outs. The miss-and-outs were all 28yds. rise. To-day was very windy and cold, with snow squalls, and the birds were very fast. The scores:

	No. 1.	No. 2.	No. 3.	No. 4.	No. 5.

East Side Gun Club

Newark, N. J., Dec. 7.—The East Side Gun Club's club shoot was held to-day on Smith Brothers' grounds, Foundry street. The wind blew a gale, and the shooting was very difficult. The club event was at 25 targets, point system. Following the main event were several sweeps, all at 10 targets, except the last, which was at 15 targets. The scores: (Figures after names indicate points scored.)

L H Schortemeier, 18	0101111100110101011011110—16

Toms River Gun Club.

Forked River, N. J., Dec. 6.—The Toms River Gun Club visited Forked River on Dec. 5 as the guests of Fred C. Worth, of that place, and were given a shoot at live birds at his home, below Forked River village. A sumptuous dinner, such as Forked River hotels know so well how to prepare, was served at the Lafayette House. Eighteen birds were shot at. Scores as follows:

D C Brewer	001220112022121120—13

A Sportsman.

Pennsylvania-Clearview Match.

Philadelphia, Pa., Dec. 9.—The University of Pennsylvania team to-day defeated the team representing the Clearview Gun Club in a close but poorly shot race. The conditions were nine men to a team, 25 targets per man, unknown angles. The scores:

University of Pennsylvania.		Clearview.	
Baldwin	16	Senat	16
Carlisle	18	Harkins	19
Dupont	12	Urian	12
Cooper	14	Carr	14
Arrison	16	Downs	17
Wiborn	14	Sibley	12
Parrish	14	Miller	14
Freed	17	Fisher	16
Smith	13—134	Elwell	11—131

Club shoot for Swain cup, 30 targets; Pennsylvania: Carlisle 24, Baldwin 24, Wiborn 22, Parrish 19, Paget 19, Smith 18, Arrison 18, Law 17, Dupont 16, Freed 13.

Sweep No. 1, 10 targets: Downs 5, Urian 6, Fisher 9, Sibley 2, Parrish 6, Cooper 5, Carlisle 5, Smith 8, Mayer 2, Baldwin 7, Wiborn 8, Dupont 4, Miller 6, Harkins 4.

No. 2, 10 targets: Downs 3, Urian 5, Senat 9, Paget 8, Arrison 7, Fisher 8, Sibley 5, Parrish 7, Carlisle 6, Smith 4, Mayer 1, Baldwin 8, Wiborn 8, Arrison 7, Law 5, Freed 6, Carr 3.

No. 3, 10 targets: Downs 3, Urian 7, Fisher 7, Sibley 8, Parrish 6, Carlisle 9, Smith 6, Mayer 7, Baldwin 8, Wiborn 6, Dupont 8, Miller 6, Harkins 5, Senat 8, Paget 6, Arrison 4, Law 5, Freed 5, Carr 5.

No. 4, 10 targets: Urian 4, Fisher 9, Sibley 3, Parrish 5, Carlisle 8, Smith 6, Mayer 4, Baldwin 8, Dupont 4, Harkins 5, Senat 4, Paget 5, Law 7, Freed 2, Carr 7.

No. 5, 10 targets, unknown angles: Fisher 8, Carlisle 7, Mayer 3.

Phœnix Gun Club.

Phœnixville, Pa., Dec. 9.—The club shoot of the Phœnix Gun Club was held here to-day. Holman won the club shoot at 25 targets with a score of 22. Scores:

No. 1, club shoot, 25 targets: Holman 22, Miller 20, Edwards 19, Dotterer 19, Hodge 18, Erb 15.

No. 2, 25 targets: Miller 23, Holman 22, Edwards 20, Hodge 20, Dotterer 18, Erb 18, Ennis 18, Tracy 14.

No. 3, 25 targets: Miller 23, Holman 21, Edwards 19, Ennis 19, Pehlert 20, Erb 18, Dotterer 20, Harris 20, Hodge 17, Tracy 12.

WESTERN TRAPS.

Garden City.

Dec. 9.—Garden City Gun Club shot this afternoon at Watson's, as see scores elsewhere. This club is beginning to take a greater interest in its regular meets as the live-bird season advances.

Garfield.

Garfield's fifth regular live-bird shoot comes off to-day at the club grounds, as reported elsewhere. This is one of our best patronized shoots.

Glenview Golf vs. Washington Park.

An interesting event is in contemplation which will give a mild fillip to trapshooting interest here. Glenview Golf Club, of Evanston, will shoot a five-men team race with the Washington Park Club, 25 birds per man, on the Glenview grounds, some time before Christmas, the arrangements not being yet completed. The contest will be for a handsome trophy, and the event will be a warm one, as it will bring together some of the best shots of two of our more exclusive clubs.

Watson's Shoot.

Nearly all of next week will be given over to Watson's annual live-bird tournament. It will be warm. Come and see it.

Eureka.

Eureka Gun Club will shoot next Saturday at Watson's grounds the day following the live-bird tournament.

Sportsmen's Trophy.

On account of the conflict with Watson's tournament, the next regular contest for the Chicago sportsmen's trophy will be shot Friday, Dec. 22, instead of Friday, Dec. 15.

Sycamore.

The Maple Park Gun Club, of Sycamore, Ill., held its annual tournament Dec. 7. The attendance was fair, but the shooting is reported to have been unsatisfactory to the members, low scores ruling.

E. Hough.

480 Caxton Building, Chicago, Ill.

Garfield Gun Club.

Chicago, Ill., Dec. 9.—This was a very mean day at the Garfield Gun Club's grounds. A cold, drizzly rain swept directly into the faces of the men at the scores.

Most of the birds were right-quartering outgoers. They were as a majority a good, lively lot, there being but about half a dozen sitters during the whole day.

Mr. Kuss had his dogs on the field to-day, and they did their work in a manner pleasing to all.

Dr. Meek made excellent scores, losing but one bird during the whole shoot. He was the only one who made a straight score in the trophy event. The scores:

	Trophy Shoot.	No. 1.	No. 2.
Dr Meek	1212111211—10	.....	.....

Ten birds: F. Wolff 8.
Nos. 1 and 2 were sweeps.

Frank J. Baum.

Garden City Gun Club.

Chicago, Ill., Dec. 9.—The Garden City Gun Club's shoot was held at Watson's Park to-day. The conditions of the club event were 15 live birds, distance and bird handicaps. Antoine won this event with a clean score. A 10-bird sweep, $3 entrance, and some practice shooting was also indulged in. The scores:

Antoine, 30, 0	221221212212211—15	.....
Ben H., 30, 0	111111112111202—15	022*212112— 8

Ravelrigg.

Minneapolis Gun Club.

Minneapolis, Minn., Dec. 7.—The attendance at to-day's shoot of the Minneapolis Gun Club was not up to expectations, only fifteen shooters turning out on an almost perfect winter's day. The management has decided to try it one or two more weeks; then if there is not a decided improvement in numbers the winter's shooting will be discontinued. The feature of the afternoon was the introduction of the new magautrap, which was given a thorough test and worked most satisfactorily. The club has arranged its trap in a manner different to all others in this section of the country, placing it 18in. lower, with slanting roof on trap pit, thereby making the target visible to shooter immediately on leaving the trap, avoiding the perceptible wait noticeable on all other similar traps ever seen by the management, making it as a whole the most successful affair yet introduced, and the shooters unanimously declare it a grand success, and would advise other clubs if possible to adopt the same plan. It will be perceived by the following scores that everybody's shooting improved with practice on the new trap, with one exception, which was President Johnston, who seemed to take kindly to the new whirligig from the start, and who shot really better than he knew how, but declares that all merry-go-rounds look alike to him, and expresses his opinion that a man with a good load ought to get them all. The club will hold a special shoot, weather permitting, on Christmas forenoon, shooting to begin at 8:30 sharp. All desiring to shoot are requested to be punctual, in order to finish the events in time for dinner. The following are the summaries in the different events:

Events:	1	2	3	4	5	6
Targets:	10	15	15	15	15	15

L. E. Parker, Sec'y.

Keystone Shooting League.

Philadelphia, Pa., Dec. 9.—The weekly shoot of the Keystone Shooting League was held here to-day. The principal events were the regular club shoot and the Keystone challenge cup shoot, both at 10 live birds. The birds were a very fast lot, and a strong wind was blowing, hence the shooting was hard. Only one man scored straight in each of the principal events. The scores:

Keystone challenge cup shoot, 10 live birds, 30yds. rise: J. Rothacker 10, Vandegrift 9, W. N. Stevenson 8, F. M. Eames 8, E. Johnson 7, Henry 6, Fitzgerald 6, Van Loon 5, A. Felix 4.

Club shoot, 10 live birds, handicap rise: W. N. Stevenson 10, Henry 9, Vandegrift 9, Johnson 8, Brewer 7, Fitzgerald 7, Geikler 7, Van Loon 7, F. M. Eames 6, Felix 4.

Sweepstake, 7 live birds, 30yds. rise, $2 entrance: Henry 6, Vandegrift 6, Johnson 5, Van Loon 5, Brewer 4, F. M. Eames 4, Geikler 4.

Sweepstake, 5 live birds, 30yds. rise, $2 entrance: Vandegrift 5, F. M. Eames 5, Van Loon 5, Johnson 4, Henry 3, Rothacker 3, Geikler 4.

Donley's International Tournament.

St. Thomas, Ont., Can, Dec. 8.—Thomas Donley's third international tournament came to a close to-day. There were four days of shooting; the first and third days at targets, and the second and fourth days at live birds. The tournament opened on Tuesday, Dec. 5, with cold, blustery weather. The entries were not as numerous as had been expected, but good sport was furnished. The shoot was under the management of John Parker, of Detroit, Mich.; G. A. Ferguson was secretary and Jas. Haight and R. Coffee were the referees.

The handicap committee consisted of James Crooks, Hamilton, Can.; C. S. Burkhardt, Buffalo, N. Y.; E. S. Rice, Chicago, Ill.; John Parker, Detroit, Mich.; E. H. Tripp, Indianapolis, Ind.; Wm. Shuyler, Cincinnati, O.; Robt. Emslie, St. Thomas, Can. Tom Donley deserves the best patronage of the shooters, and he spares neither time nor expense to give the boys a good time. The American shooters were enthusiastic over the tournament, and all entered for next year.

First and Third Days, Dec. 5 and 7.

The two days of target shooting consisted of sixteen events, with a total of 230 targets and $29.90 entrance. Fred Gilbert came out on top in the two days' shooting, with 216 targets and a percentage of .939. This was good work, considering the unfavorable weather, which made shooting hard. Rollo Heikes was second, with a percentage of .900, 9 breaks behind Gilbert. The largest winners, however, were Tripp, Kirkover, Sconce and Young, as the professional experts shot for targets only, but counted in on the average.

One cent each was deducted from all targets thrown, which went to make up a general average fund, to be divided among those making the five highest averages in the target events. On Dec. 7 several extra events were shot as follows: 10 live birds, $10 entrance, fifteen entries.—Winners: Fanning, Kirkover, 10 each; Gilbert, Budd, Heikes, Marks, Parker, Hallowell, 9 each; Tripp, Wood, Donley, 8 each.

Same conditions, thirteen entries.—Winners: Gilbert, 10; Heikes, Budd, Hallowell, Wood, Brady, Kirkover, 9 each; Marks, 8; Donley, 8; Young, 8; Fanning, 8.

Same conditions, fourteen entries: Heikes, Gilbert, 10 each; Fanning, Hallowell, Kirkover, Tripp, 9 each; Budd, Donley, Brady, McCarthy, 8 each.

The scores of the target events shot on Dec. 5 and 7 follow:

Events:	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	
Targets:	10	15	20	10	15	20	10	15	10	15	20	10	15	20	10	15	Av.

Second Day, Wednesday, Dec 6.

Three live-bird programme events were shot to-day, one at 5 birds, $5 entrance; one at 7 birds, $7 entrance, and one at 10 birds, $10 entrance. In addition to these a miss-and-out, $3 entry, was shot. The event had fifteen entries, and the winners were: Kirkover, Heikes, Fanning, Parker and Wheeler, 9 birds each. Then followed a 5-bird sweep, $3 entrance, high guns, twelve entries. Winners: Tripp, Gilbert, Sconce, Hallowell, Fanning, Kirkover, Heikes and Parker. The scores of the second day's shooting follow:

Event No. 1:

Gilbert, 31	2*221—4	Dart, 28	020w

Parker	1121012221— 9		

Fourth Day, Dec. 8.

To-day was devoted to shooting the grand international handicap. This event was to be at 25 live birds, $20 entrance, birds extra, $700 guaranteed. By consent it was changed to $20, birds included, owing to the small attendance. The handicap was won by Bates with a clean score, and his win was a popular one, and well deserved. He is comparatively a young shooter, and a popular one. Several extra events were shot to-day, as follows:

Ten birds, $5 entrance, high guns, nine entries.—Winners: Emslie and Marks, 9 each.

Match, 10 birds: Sconce 10, Tripp 9.

Same: Sconce 9, Tripp 7.

Scores of grand international handicap:

Bates, 28	2222222222222222222222222—25
Wheeler, 28	1112212222021221221121222—24

ON LONG ISLAND.

Phoenix Gun Club.

Brooklyn, N. Y., Dec. 7.—At the monthly shoot of the Phœnix Gun Club, at Dexter Park, ten members faced the traps. All stood at the 25yds. mark. The feathered targets were fast and strong, and the afternoon was quite cold, there being a biting frost in the air. Nevertheless some exceedingly good scores were made. John Ackhurst, or "Uncle John," as he is called by the rest of the members, grassed 11 hard birds, and yet he is eighty-seven years of age. Ed Madison also has passed the three-score mark; yet he killed 14, and would have had a clean score but for one fast incomer. Scores:

E Madison	120111111111121—14	F Gardner	101111121020201—11
A Botty	122121111011221—14	J Ackhurst	211102022110110—11

Uncle Dudley.

Parkway Gun Club.

Dec. 5.—At the regular shoot of the Parkway Gun Club, held at Dexter Park to-day, W. Vorbach was the only member to make a straight score, thereby winning a pair of Swiss mantel-clocks. S. M. Van Allen, who shot as a guest from the 30yds. mark, also made a clean score. He shot a Diamond hammerless Daly gun. This young man is a member of the Aqueduct Gun Club, and is a promising young shot, bound to be in the front rank of wing shots of this country soon. The scores:

Uncle Dudley.

Brooklyn Gun Club.

Brooklyn, N. Y., Dec. 9.—A new series of prize shoots was inaugurated at to-day's shoot of the Brooklyn Gun Club. The conditions of the event are 30 targets for a solid gold badge, to be shot for at three successive meetings of the club, highest number of points to win the prize; no handicaps, re-entry allowed once in each 10 targets. Hopkins finished ahead in to-day's event. The scores:

PUBLISHERS' DEPARTMENT.

The Spat-Puttee and New Patent Puttee, elsewhere advertised, have certain manifest advantages over the commoner leggings or golf stockings, one of which is that they can be made to fit the legs, and that they offer an even pressure and support. The new leg covering is worth looking into by men who take much exercise on foot.—*Adv.*

The general good business conditions of the country to-day affect of course all dealers in sportsmen's goods, and the unusual abundance of birds in certain localities, especially, interests the gun trade. Thus we learn that recently Messrs. Wm. Reed & Sons, of Boston, shipped in one order to one Western club five Scott Premier guns at $400 each, selected arms, finished in the highest style.—*Adv.*

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1899, BY FOREST AND STREAM PUBLISHING CO.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, SATURDAY, DECEMBER 23, 1899.

VOL. LIII.—No. 26. No. 346 BROADWAY, NEW YORK

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, $4 per year, $2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iv.

FOR CHRISTMAS READING.

THE columns of FOREST AND STREAM this week contain a store of capital reading for Christmas. Next week will be given a double page supplement illustration of the primitive American hunter's way of buffalo hunting.

TREES ON THE WESTERN PLAINS.

IT has long been believed that one of the principal causes for the absence of timber on the Western plains was the fires which constantly swept over them, set, as many persons believe, by the Indians, either for the purpose of renewing the grass, or to drive the game animals from place to place, or to baffle pursuing enemies. This explanation has been generally accepted, and is no doubt a true one. It is probable that the fires, by burning close up to the edges of the existing timber patches along the streams and thus destroying the seedling trees, had more influence than any other cause in keeping the plains treeless.

As long ago as 1897 Prof. Chas. E. Bessey showed that there were reasons for believing that the pines of western Nebraska are moving eastward over the plains, in places where the fires have been kept out, and cattle are not permitted to destroy, and man himself is not too actively engaged in the work of forest destruction. Since that time observations on these Western pines have been continued, and Prof. Bessey feels certain that in western Nebraska and in portions of the Black Hills of South Dakota these trees tend to advance over the plains and in many places actually do advance at a rate sufficiently rapid to be easily observed.

Prof. Bessey's observations have not been confined to western Nebraska. He has also studied tree areas in the eastern portions of the State; and here still more conclusive evidence is found that the trees are advancing upon the Nebraska plains and advancing quite rapidly. The traveler who journeys up the principal streams finds them wooded with trees that are old, but as he passes out to the side branches and to the little temporary rills which water the upper basins, he finds that the trees are of small size and are much younger. It is a very rare exception to find large trees near the upper end of a forest belt, and of course by upper is here meant western or northwestern, since all the streams flow east or a little south of east. The rule is that near the upper edge of any tree area there is much shrubbery, and with the shrubbery are mingled young trees not more than fifteen or twenty years old. Obviously where these conditions prevail almost universally, the young trees have grown since the country began to be settled and since it has thus been protected from fire.

This condition of things is so generally prevalent and its cause is so evident that the matter has impressed itself on many of the older settlers who recall the country as it was in its almost treeless condition. Persons who have resided long in one locality testify that the native timber in their neighborhood has crept up the water courses or has widened out from near the stream banks so as to cover a much greater area than formerly. Others declare that ravines, where formerly, in the old days of frequent prairie fires, no timber grew, now contain large patches of woodland. The dates of this testimony, running back as they do as far as 1872, are extremely instructive.

It is on the treeless plains that people appreciate at its true value the presence of tree growth and it is to be hoped that the increasing area of Nebraska's woodland may be so protected that in time its forests may become of real commercial value to the State. It must be remembered that Kansas and Nebraska are both of them fairly well watered, and that over much of the eastern portion of both States there is now a considerable rain fall. It will be interesting to see how far the observations here noted shall be confirmed later in other States where the climate is more arid.

AN EXTRAORDINARY DECISION.

THE Supreme Court of California has rendered an extraordinary decision in the case of a Stanislaus county hunter who killed game for export from the county in violation of a county ordinance which provides that game may not be exported. This the Supreme Court says is a violation of the right of private property as defined and regulated by general law. In this the California court runs counter to the precedents and to common sense. Nothing is better established in the entire realm of game protective legislation than the right of the State to provide the purpose for which game may be killed and to regulate the disposition of it after it has been killed. Under a law which forbids the export of game, the individual who takes the game cannot acquire in it any such right of private property as will permit him to export it. He can legally acquire only the right which the law gives him, and which in the present instance is to use the game within the county where killed. The State has the same undoubted right to prohibit the export of game that it has to prohibit the keeping of game in possession after a given period. If the principle upon which this California decision is based were rightly to apply to the export of game it would apply with equal force to the possession of game, and the next step would be for the California justices to declare that the restriction of the time in which game might be held in possession was an unwarranted interference with private property. The decision is so in violation of principles upheld by the highest courts of other States and the Supreme Court of the United States that there is no reason to believe it will stand against appeal if the authorities shall carry it up. This "private property" delusion respecting game is one of which it might reasonably be expected the California judiciary should be free.

THE CREE HALF-BREEDS.

AT the collapse of the so-called Riel rebellion, a large number of half-breeds, who had presumably been concerned in it, fled across the border from the Northwest Territories and settled in Montana. At the same time a number of Cree Indians made a similar migration. All these people have since resided in Montana, although on one or two occasions United States troops at the request of the Indian Bureau have gathered up the Indians, taken them to the boundary line, and thrust them across into Canada. But so soon as the troops moved away, the Indians returned to the places along the Missouri and Milk rivers, where they have been accustomed to live.

Many of the Cree half-breeds settled in the Judith Basin, where some of them have done well as farmers and stock raisers. Others, however, spend their whole time hunting and trapping, destroying game, fur and fish at all seasons, without regard to the law of the land, of which they are presumably ignorant. It will be remembered that two or three years since these half-breeds got in among a little bunch of buffalo which still ranged in the neighborhood of the Dry Fork of the Missouri, and killed about sixteen of them, which was perhaps more than half the herd. We believe that no steps were taken at the time to punish them for this, though there was talk of sending out troops to capture them.

During last autumn these half-breeds have been hunting as usual, and as usual in violation of the law, and since their methods are so well known it would certainly seem worth the while of the authorities of Montana to take steps to put an end to this abuse. A very few convictions would do this. It must be understood that these half-breeds have no hunting rights in Montana or anywhere else beyond those possessed by the ordinary white citizens of the State. Their case is not like that of certain tribes of Utes in Colorado, or certain Bannocks and Snakes in Idaho and Wyoming, to which the United States long ago guaranteed forever the right to hunt on the unoccupied lands of the United States. On the contrary, these half-breeds are immigrants, real outlanders, and should be held to a strict accountability to the law.

This law provides that every person who willfully hunts, chases or runs with dogs any buffalo, moose, elk, deer, antelope, Rocky Mountain goat or mountain sheep, shall be punishable. Now all through this autumn of 1899 the Canadian half-breeds have been hunting in the Missouri River Valley below the mouth of Arrow Creek, running white-tailed deer with dogs and killing many of them. There is every reason to believe that they are doing this to-day, and that they will continue to do it until the spring, for they pay no regard to times or seasons as established by the game laws.

Montana game has already become so scarce that what is left ought to be protected. It is probable that the rounding up by the proper authorities of the few of these half-breeds will have a wonderful effect on the Montana game supply within the next few years.

NOT SPORT.

IF it is true that nothing affords a better mirror of the characteristics of our ordinary life than the newspapers of the day, it is also true that too often the newspapers seize on the worst characteristics of that life and unduly emphasize these, while less than is just is said concerning the better side of humanity. The every day accounts of the world's life show very plainly how much of the savage is left in the civilized man of to-day. To say nothing of the more vulgar and commonplace crimes, or of the horrible outbursts of criminal excitement which from time to time flame out all over the land in lynchings, often countenanced and approved by the so-called best people of a community, we often see in accounts of the amusements of the people mention of unnecessary cruelties practiced on animals which are almost beyond belief. In certain parts of the country it was for years the practice to turn loose rabbits in tight inclosures to be chased by dogs until captured. Later, this was modified by providing inclosures with exits too small for the dog, but which the rabbits could use—if they discovered them.

Recent accounts of wolf chases in the West tell how the animals pursued had first been captured in steel traps, and then, maimed and crippled, were turned loose to be hunted by the dogs. The matter is treated as if it were the most ordinary thing in the world, and it is altogether probable that it never occurred to whoever wrote the article that there was anything unusual about the occurrence.

A large portion of such cruelties are due merely to thoughtlessness, which in such a case is only another name for selfishness. They are not due usually to the actual desire to inflict pain. But it may be questioned whether the thoughtlessness is not as reprehensible as the intentional cruelty would be. Certainly the result of the one differs in no respect from those of the other.

One cannot walk along the city streets without each day seeing trucks and drays so overloaded that the animals which haul them can only just drag them along and become stalled on reaching the slightest ascent. Such overloading is less the result of intention than of the same carelessness and thoughtlessness which indeed are at the bottom of much of the wrongdoing of the world.

In the past we Americans have been disposed to speak of the brutality of the Spaniards and to plume ourselves upon the fact that bull fights are not permitted in this country, thanking God that we are not as other men. If we are not, the difference is one of degree only, and there still remains in this land work enough to be done by thoughtful people and by our humane societies.

Malcolm Graham, of the well-known firm of Hartley & Graham, of this city, died at his home in Seabright, N. J., on Monday, Dec. 18, aged sixty-seven years. By his death the sporting goods trade loses one of its oldest and most prominent members. The original firm of Schuyler, Hartley and Graham was formed in 1853; for many years it was in Maiden Lane, removing thence to the present Broadway establishment. Mr. Graham was one of the owners and officers of the Union Metallic Cartridge Company, the Bridgeport Gun Implement Company and the Remington Arms Company. He was a man of wide social activities and a member of many clubs and societies.

The birds of the National Zoological Park at Washington form a considerable collection, and will doubtless be largely augmented now that as a nation we are reaching out into tropical climes, where birds of beautiful plumage are to be had. Southern species, such as pelicans, flamingoes, etc., have already suffered at the park for want of suitable winter quarters, and no time should be lost in providing a bird house that would prove both useful and ornamental. It is to be hoped that those in authority may succeed in impressing on Congress the immediate and urgent need of such a building.

For Christmas Reading.

Sam's Boy.—IV.

The house was very quiet when they entered the kitchen. The doctor was gone, but the odor of his decoctions still lingered, and Aunt Jerusha and Maria Hill were busy at the stove with several messes, some nutritious, others medicinal. Mrs. Purington sat apart in a rocking chair, critically observant, and with an air of general disapproval, her smelling bottle and handkerchief in either hand.

"Wal, young man," she sighed, regarding her grandson mournfully and quite ignoring Uncle Lisha, "your nose is aout o' j'int!"

Sammy put one hand to that rotund feature, and was not a little surprised to find that he had suffered no perceptible change. "Where's mammy?" he asked.

"Why, bless his dear heart!" cried Aunt Jerusha, "Mammy's in the bedroom an' she's got a leetle sister for him, 'at the darkter fetched in his saddle bags, an' he shall go right in an' see it!"

Wherewith she took him by the hand and led him to Huldah's bedside, where she was lying very still and pale, with a world of love beaming from her soft eyes for her little boy when he was lifted up to kiss her and be shown the wee miss of humanity that was cuddled beside her.

"She hain't so pooty as the new pigs," he commented. "Will she see some time, an' talk, an' walk?"

"Yes, deary, an' be a dear little sister for him to play with an' ta' care of."

Then with many injunctions to lie very still, he was left to lie beside his mother and whisper his story of the day's adventures. Returning to the kitchen he had some disparaging remarks to make concerning his new relative, and of the doctor as a purveyor of such additions to the family.

"If I was the darkter I'd keep 'em till they got bigger afore I fetched 'em," he said, thinking it would be a long time for him to wait for this nestling to become an available playmate. Ruby Hill's dolls were better, for they would bear rough handling, while he was scarcely permitted to touch this fragile mite.

"Wal, I du hope tu land o' goodness," Mrs. Purington groaned, "whatever comes, when it comes tu namin' this baby, she won't be named so utter ridic'lous as what he is! I du think it's time my folks was considered a leetle in a-namin' my grandchildren. Eunice would be a nice name for her, an' would come real handy for her tu hev all my sheets and tablecloths marked 'E. B.' in the right-hand corner, some in cross-stitch an' some with endurable ink, an' all she'd hafter du 'd be tu put on a 'L.' Don't let me forgit tu mention that tu Huldy in the mornin'. But, oh, dear me, suzzy day! I p'sume tu say that ol' Gran'ther Hill—my sakes, M'rier, what hev I said? But I won't spile a story for relation's sake—'ll come over here an' coax 'em tu name her Rew-by or Mer-ri-er or mebby that Antwine Frenchman 'll git 'em tu name her after his womern. Some way they'll work it tu take a name aouten honest people's maouths. But she won't git my linen sheets an' tablecloths 't I wove when I was a gal, an' no gal naow-er-days knows 'nough tu spin, let alone warpin' a web. I do' know what this world is a-comin' tu! It does seem as 'ough the next gineration wouldn't know nothin'!" She sought consolation for the degeneracy of the times in her smelling bottle, and shut her eyes upon a naughty world.

"Oh, law sakes! I guess there'll be a name pervided some way; the' allers has b'en, an' what a lot on 'em!" said Aunt Jerusha, cheerfully, as she bore a basin of gruel in to Huldah.

"Unc' Lisher, Aunt 'Rushy says she guess' you'll cover my ball," the little boy said, coming to the shoe bench and laying a newly wound ball of yarn on the old man's knee. It was tightly wound of raveled stocking yarn about a core of India rubber made of strings cut from one of the shapeless rubber overshoes of those days, and was wonderfully elastic, as Uncle Lisha proved by casting it smartly on the floor, whence it bounded almost to the smoky ceiling, and at the second rebound splashed into the water tub, where it bobbed up and down for an instant before it was snatched forth by Uncle Lisha's rescuing hand.

"Good airth an' seas! That was tew bad tu go an' chuck that 'ere new ball inter the natsy ol' tub!" he shouted, wiping the dripping toy on his apron. "My! it's alive, hain't it? An' it jest went an' hopped in there for fun. But it hain't hurt it one mite, an' he needn't go tu puckerin' up his face abaout that! We'll let that 'ere baby in there du the cryin'—she hain't nothin' else tu tend tu. Naow, I hain't go no piece o' luther in the shop fit fur tu kiver such a neat ball, but I know where the' is some 'at 'll du it complete wi' jest a leetle mite o' fixin'. It's on a' ol' woo'chuck naow, but it's jest a-itchin' for tu git on this ball an' ha' some fun. An' I da' say the woo'chuck feels jest that way about it, for he's b'en a-eatin' your daddy's clover an' a-tramplin' of it daown this tew year, an' oncte he stole some beans, an' he'd orter feel ju' like makin' some returns for all he's hed.

"I hain't got nothin' drivin' on hand, so I'll git one o' your daddy's traps an' we'll gwup an' talk it over wi' Mr. Woo'chuck."

He went in quest of a trap, with which he presently returned, and the two set forth, the child clinging to the old man's finger to keep himself on foot in the tangle of May weed that bordered the wagon track. They soon entered the meadow, and afar off over the clover and the budding daisies saw the woodchuck sitting at his open door, a brown lump in the yellow threshold of fresh loam.

"There he is!" said Uncle Lisha, stopping to cut and trim a crotched stick from a hazel thicket. "He's a-waitin' for us, but he'll run intu his haouse long 'nough 'fore we git there. An' then, like 'nough, he'll come aout tu stay, an' go hum wi' us, mebby. 'Long last fall, when the clover begin tu git frosted, an' the ol' bumble bees 'at got drunk on the honey, an' laid aout over night, waked up mighty stiff in the mornin', an' ol' Mr. Woo'chuck smelt the col' weather comin' nigh, he jest went int' furder eend o' his suller an' curled up an' shet his eyes an' went tu sleep an' dreamed o' clover an' bean patches till they come true in the spring.

"I do' know whether or no it was a robin a-singin' 'at woke him, or the blackbirds down by the brook, or a skunk come in an' bid him good-mornin', but some way or 'nother he got woke up an' come aou' door, an' the snow wus all gone, an' the' was a twinge o' green on the warm sidehills. I most wish 't we could du ju' so, only we'd miss the skatin' an' slidin' daown hill. Yip! there he goes a-whistlin' int' his hole!"

A whisk of the brown tail was the last they saw of him for a while, and a smothered whistle the last they heard. Uncle Lisha drove the stake through the chain-ring, set the trap, covered it carefully and removed to a cozy bend of the bank, where the old man lighted his pipe; and Sammy, after the manner of his kind, began teasing for another story. But while Uncle Lisha was rummaging his wits and the landscape for a subject, the brown nose of the woodchuck reappeared, making a cautious reconnoisance; there was a sharp metallic click, a clink of the chain, and a loud, querulous whistle that was smothered instantaneously in the depths of the burrow.

"Hooray! We got him!" Uncle Lisha shouted, getting quickly to his feet and hurrying to the place, Sammy running beside him in breathless excitement.

The chain was drawn taut, and the stake was quivering with the strain upon it. Uncle Lisha loosened and pulled it up, and began drawing forth the captive. Now the trap appeared with a brown leg in its vise-like grip, then a grim, grizzled head, growling and gnashing the long white teeth.

"Oh, I do' want no cover on my ball!" Sammy cried,

THE CAMP AND CHAUNCEY'S HEAD.

shrinking back. "Let him go, Unc' Lisha; let him go!"

"Bless your heart, child, he can't hurt nob'dy! See!" the old man said, reassuringly, and gave the poor brute a stunning blow, which, twice or thrice repeated, put an end to his struggles. "My, hain't he a nice fat one, an' won't his hide make a complete kiver for aour ball, oncte we git it tanned good!" and now that the cruelty of capture and killing were over the boy's nature began to assert itself, and he, too, exulted over the exploit, yet not without twinges of remorse.

"Hain't he big? An' haow quick we ketched him! But he won't never come aout an' see haow pooty all aou'doors is! Poor ol' woo'chock. Say, Unc' Lisher, when we git most hum' may I kerry him?"

"Oh, I guess we do' wanter lug his ol' carkis hum, du we? He's tough an' strong, but Bub can kerry the skin hum, just as his daddy doos he's fox skins," and Sammy being reconciled to this arrangement, Uncle Lisha stripped off the skin, and the two went home, the boy running in advance to display the trophy and tell the story of its capture.

Uncle Lisha consigned it to the soap barrel without knowledge of the too fastidious women kind, whence it was taken after a couple of days, ready to yield the bedraggled hair to persuasive scraping, and then was pulled, rubbed and kneaded until it becme as pliable as a glove, and as yellow as a lemon.

"An' naow I b'lieve if that ol' woo'chuck could see it he wouldn't know it, an' if he did, he'd be praoud on't," said Uncle Lisha. "Oncte when Clapham was a boy, a-goin' tu school, he was allers a-dickerin'," said he, musing on the past. "In the summer he'd ketch woo'chuck an' tan the' hides an' make 'em intu shoe-strings for a pint o' corn a pair, an' the lashes for a quart, an' then he'd sell the corn for nick-nacks—pins an' needles, an' buttons an' combs, an' then he'd peddle 'em aout for cash, an' so arter a spell got tu keepin' store. That is the way he got a start in the world."

According to some occult rule, the old shoemaker cut the skin into oval quarters and sewed them over the ball with waxed ends, and soon had it ready to meet the fate of all balls, which is to get hopelessly lost.

"There," he said, handing it over to its proud owner, "You can play tew ol' cat, or barnbase, or most anything wi' that 'ere ball naow," and Sammy went forth rejoicing.

ROWLAND E. ROBINSON.

[TO BE CONTINUED NEXT WEEK.]

Five Foot Five.

There may be sermons in stones and running brooks, but in the footmark of the moose is a whole hand-book of philosophy. This, of course, may sound like a mixed figure of speech, but none the less it is sense. I know.

On divers occasions I have followed the trail. It began, years ago, on the back slopes of Saddelback and Baker mountains in Maine. Then it switched eastward to Sourdnahunk and the mighty, mystic Katahdin, rising purple out of the wooded knolls of Pamedumcook and the Ambijeejis. Again, it was at Rainbow and Nahmakanty ponds; ever the same, always teaching the philosophy that man can expect in this vale of tears only death and taxation.

Again: Now the spoor led down by the headwaters of the Ottawa, east of Temiscamingue, the deep water, round Hamilton and Rascicot, by Line Lake and the great Caughwana. I was trying valiantly. Sometimes, as a change, I sat with frozen marrow, listening with chattering teeth to the reverberating, mourning echo of the horn. Again and again came the answer, the short, eager guttural of the answering bull. But in the end it was always the same. The only thing lacking, the great bull with the antlers as widespreading as the beech of Tityrus, I could not see.

Last year, after a heartrending journey by horse and foot, I wandered into the wilds of Bald Mountain, where the Little Tobique rises in the blue water of Nictor. As usual, I saw many moose, and as of old, let them go by unmolested. As a feature of my luck, one bull, a monster, answered our call. But it came not to me. Below, in a canoe on Mud Pond, sat my friend, Col. John Wesley Hunt, of Louisville, Ky. In his hands was a brand new rifle, of small caliber, but deep penetration. It was his first time in the big woods; he had never seen a moose. His heart was filled with a desire to fill the east wall of his dining room with the head of a leviathan, and unaware of my ability to hoodoo, had elected to hunt his trophy with me. He fired five times at that moose, and never having fired in the dark before, bored merely five small holes through the atmosphere. The moose, I may say, retired. Ad Moore, the guide, said his horns measured 5 feet across; I should judge from their description it was seven. But I do not know.

Again I went home without the moose. The two I had shot in years gone by dwindled into negative memories. My vow was still unbroken. I had foresworn to kill nothing but the monster. Hope still sprang wildly within my breast. I promised to return to New Brunswick when the year swung round again.

"Listen," said the Hon. Chauncey. "I have never shot a moose."

"Same here," said the robust Robert.

"Little better," said I.

We agreed upon New Brunswick. I wrote to the distinguished Mr. George Green, of St. Elmo. It was all arranged. At 11 P. M. of Nov. 1 we arrived at the excellent hostelry of Mr. Allan Perley, on the left bank of the Tobique.

"Hello," murmured Mr. Perley, in mild astonishment. "Still after that moose?"

We set into the woods near the head of the Tobique. George pointed the course over an abandoned tote road that seemed like a mezzotint of Newtown Creek at low water. Ere long it snowed, and we were greatly cheered thereat.

In addition to George, we were attended by the brothers Day. They called themselves Day, but together they seemed little more important than an hour. I trust you will permit me to dismiss them in a paragraph. We dismissed them when we got to the headwaters of the Miramichi with a little more than that, but I do not recollect what we said, and at any rate it would be unfit for publication. George assisted. It was no fault of his that we had been led to engage the two, but it was a fortunate thing. It led to our getting Henry Lewis and Bobby Knowlton, two excellent, observing woodsmen, cheerful, full of adventure, and most excellent companions. But to resume:

"How big must he be?" asked George, tentatively, speaking of the moose.

"Not less than 4 feet wide, George, and anywhere up to eight. Beyond that, I draw the line. What are the chances, George?"

"Dear knows," said he, titillating one ear in doubt.

Our first day of hunting was on a fresh, soft snow. The Hon. Chauncey went southwest; the robust Robert went southeast; I went north. Nightfall came, and as usual I had no moose. It was the same with Robert. Also, it was likewise and rather different with the Hon. Chauncey.

It was dark when he returned to camp. He staggered inside, dropped with abandon into a seat, and sighed. His rifle fell clattering into a corner unheeded; his woe was unspeakable. Henry, snapping open the stove door, swore gently into the flames.

"It measured 50 inches," said the Hon. Chauncey.

"Or 56," muttered Henry.

"There were three of them—two bulls, both big, and a cow. I overshot."

"At 80 yards—only his head and shoulders showed," muttered Henry, with consoling grace.

It was the old, old story, with a variation. There was excuse for the overshooting. The rifle showed it. One sight wobbled up and down like a loose front tooth in the hand of experimenting youth. With such a gun, one might fire at a landscape and destroy the planetary system.

The two had tracked the bulls above two miles, and come upon them standing in a thicket. The big bull alone showed till the shot, when the others jumped into view. The Hon. Chauncey was paralyzed with regrets. He was advised that about ten years of experience would harden him.

I went eastward toward the head of the Miramichi the following day, and saw no moose, although signs were abundant. None was fresh, however, and we spent a futile day looking for a new track to follow. Once George and I thought we saw a bull, and spent a heartrending fifteen minutes crawling up on him. It proved to be merely a ghost, however, for when we got up to the place there was neither a moose nor any track or trace of one.

"It was a hoblin," explained George, simply meaning, presumably, a goblin.

The Hon. Chauncey returned with a fresh batch of regrets; the robust Robert with nothing.

"Saw three to-day," said the Hon. Chauncey. "Got stage fright and no moose."

From the hysterical account of himself and Henry, it was impossible to draw conclusions. It is not even definitely known whether he fired.

Thus it went on. One afternoon George and I walked up the ridge toward camp, George a rod ahead. Three hundred yards from the cabin, up jumped two moose.

"Moose!" hissed George.

I looked ahead and beheld the old familiar form, the great, black bulk, the yellow legs, the wig-wagging ears. I looked for horns; there was none. The bulk upheaved, waved an airy adieu with the legs, and was gone. It was the biggest cow I ever saw. With her was a small bull. We followed half a mile till we saw the insignificance of her consort, and returned to camp. The Hon. Chauncey was there with his usual tale.

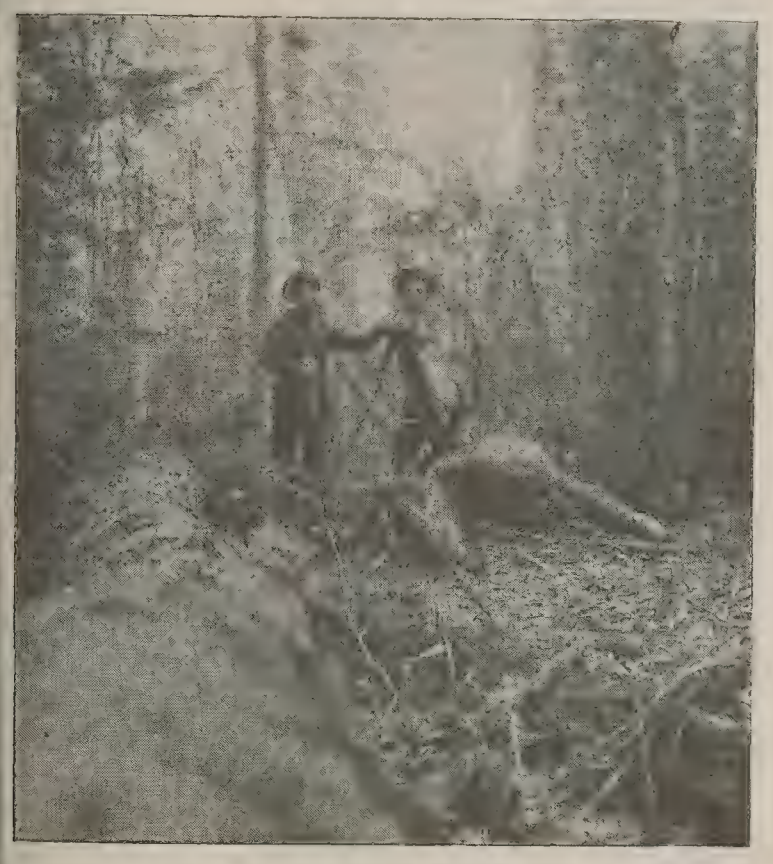
"Now see here," I remarked, "I'm going out with you to-morrow to see what all this means. George can go eastward with Bob. I'm going to try to rub off some of your luck."

"I'd sell it for the price of a stamp," answered the Hon. Chauncey, eagerly.

We set forth just after dawn. At this day most of the snow was gone. But the bare leaves were fairly silent, and soft-footed we set out to the scene of adventure. By and by we found a track. The Hon. Chauncey was to have first shot. We dipped down the ridge, crossed a flat, and stole over a little knoll. As we reached the crest I looked down into the hollow.

There was a bull moose making tracks with all the haste and intelligence that he had been endowed with by nature.

"Shoot!" I yelled to the Hon. Chauncey. He could not see the bull. In a brief instant I couldn't either.



We followed to see what had happened. We found that in his flight he had stampeded four other moose. Two at least by their tracks were big bulls.

"Cuss!" said Henry.

"Cuss!" I echoed.

We boiled the kettle in a swamp, and climbed anew to the ridges. At the top we observed a sable, clinging to a fir tree like a rat to a rafter. The Hon. Chauncey desired to shoot him with a .45-90, smokeless powder and metal patched bullet. Henry and I dissuaded on the ground that even if he did hit, he never would know. Neither would the sable, for that matter. I had some seven-grain cartridges for the .30-40 I was using. I had taken them to try. The Hon. Chauncey tried some afterward. He said one might hit a mountain with them, provided one was inside the mountain in a tunnel. After considering, he added to the hypothesis the premise that the tunnel should be walled in at both ends. He was a wag, was Chauncey.

I fired at the sable three times, and the sable concluded to move out of the country. We went with him. Henry tried to immolate the beast with his pack. He missed with that; then he tried his hat. It was of no avail; the hat missed fire. Then he threw his axe, and the sable

GEORGE AND HENRY.

came almost as near to sudden death as the late lamented Charles I. After that the sable clambered into a brush heap, and there was nothing doing.

"You're a fine moose hunter, you are," sniffed Henry.

"Who's moose hunting?" I retorted. "D'you call this excursion a hunt?"

It was all foolish, of course. We went back and hunted up Henry's axe; then we looked over the country and went back to camp.

The robust Robert returned with a scorn for moose. There never was a moose, said he, and he knew he never would get one. He said he never could get anything, anyhow, forgtting that on two occasions he had shot the biggest caribou of the year. I knew the feeling; I had had it for about twelve years.

"George," said I, on the eve of the ninth day, "to-morrow is Friday. I never have had any luck killing big moose on Friday."

"Or on Saturday, Sunday, Monday and Tuesday," cut in a mental corrector, "to say nothing of Wednesday and Thursday."

But ignoring the inner consciousness, I resumed.

"I have never had luck on a Friday, and so to-morrow we will go to the southwest."

We went. At dawn we started down the old tote road and plunged into a new wilderness. We traveled till noon, saw nothing, and returning to the trail, hunted up a spring and boiled the kettle.

We ate cold boiled pork and drank tea in silence. Refreshed, we started anew. Half a mile on our way southward something jumped in the bush. For an instant I saw a white flag wave to me from the thicket. Then I saw another.

"Caribou!" whispered George.

I looked for horns. There was a prodigious crash, a scurry of swift-pounding hoofs—away went the caribou. They had smelled us. Then, for a brief instant, I had a glimpse of two tremendous caribou bulls, each with a gigantic set of horns. The next instant, before the gun was upon them, they were gone.

We stopped and stared at each other. George grabbed me by the arm, and helter-skelter we pursued. But they had smelled us; they did not halt. We chased them for

MR. FOSTER AND HIS MOOSE.

perhaps 300 yards. George said it was about that. When I arrived at the end of it, I differed with him. I thought it was 3,000 parasangs. Maybe it was only 4,000—I do not recollect.

At this point, please notice I did not shoot those caribou. Till time immemorial, I will ever offer thanksgiving that I did not. I am still wondering why this was not included in the President's proclamaton.

Had I shot those caribou, I could not have shot my moose.

I have requested the editor to set this line in poster type, printed in red ink with a handful of asterisks, exclamation points and stars at the end of it. It is important.

Sadly we retraced our steps.

"George," I remarked, "you're a bunco."

"You're a hoodoo," he returned.

"Do you think we'll ever see the big moose, George?"

"Dear knows."

I knew George to be a thoughtful, discerning person. Once I was sitting upon a log with him in the dim closes of a forest aisle, when I saw his eye roam aloft. He was not communing with the heavens, nor yet was he engaged in weather observations. He was looking, instead, at a woodpecker. By and by he spoke.

"There's many a fool in the world," said he. "Look there at that bird. See him sitting up there on a hard, dry stub, pecking and pecking away, beating his everlasting, blasted, goldarned brains out for one meeserable dodgasted little worm."

Thus I knew George to be observing, and the parable of the woodpecker and the worm returned with sudden vividness when he said, "Dear knows."

"Anyhow," he added, "I'm going to get a partridge." With that he leaned down and picked up a boulder lying in the roots of an upturned tree. First partridge I see," he added, with sudden emphasis, "I'll knock its billy-be-goldarned head off."

We walked along the trail, homeward. George had his rock ready; whereas I hunted moose. After twelve years' experience I could not walk through the woods without looking for that monster bull. So we stole along softly. George for his partridge, I for my moose. Years ago, in reading Van Dyck's "Still-Hunter," I came across a passage that has ever been fixed in my mind. Its gist was *nil desperandum*. It was a hint to hunt to the last, till the gun was in its case, till the woods were left behind for town, and the solitude only a memory. Therefore I hunted.

We came back to where we had boiled the kettle, climbed the ridge and plunged down the other side. Beyond was a little valley, holding in its hollow a swale fringed with a growth of birch poles and roundwood. George still looked for his partridge.

Crash! What happened thereafter is the truth, solid and unimpeachable.

I looked over my right shoulder, swinging the rifle to ready as I wheeled. George jumped out of range. Together we peered into the thicket, and a black colossus arose before our views. I saw its shadowy bulk through the thicket of poles. For an instant I could see no more. Then the glint of yellow horns caught my eye. I saw they were broad; I saw it was a big moose. But how big I had but a vague idea.

George saw and heeded. As the moose turned to run, he caught a full view of the antlers. A frenzy shook him at the sight. He was transformed into a very genius of madness; I saw, in a glance, his eyes start out, and his mouth open.

"Horns!" he yelled. "Horns—shoot!"

The crack of the rifle had cut him short; the moose had started. He was then, perhaps, 80 yards away. I heard the crashing of his horns upon the trees, saw his form vaguely as he plunged through the tangle, and at every glimpse I fired.

George had run two rods up the trail. He was waving his arms, shrieking an unintelligible bedlam of direction; his hat was off, and he leaped up and down in strenuous excitement.

"Give it to him!" he screamed.

I recollect looking along the barrel and turning the magazine loose. I knew dimly that it was the big one at last, but how big I could not guess—4 feet, perhaps. I could see the tips of the horns, and they were my guide. I held diagonally down from them, searching for the fore shoulder. The rifle fairly rattled. I recollect once firing nine times at a deer while he was crossing 50 yards of open ground. But at that moose I broke all records hollow. As fast as I could work the finger lever and drop the sights into alignment I fired. George still flourished his arms.

"Here! here!" he shrieked. "I can see him him."

"So can I!"—bang!

Then—click—the hammer fell with no answering detonation. The last shell was gone. While I had been pouring lead through the thicket, I had been singing an anthem to myself, an anthem that rang uproariously like a Wagnerian chorus above the staccato crack of the Winchester—"Why don't I knock him down? Why don't I knock him down?"

The magazine was empty. I thrust a hand into my trousers pocket and clutched a handful of cartridges. In my frantic haste all but two fell upon the ground. The remaining two I jammed into the receiver and snapped the breechblock home. By pure good fortune, a shell pushed into the chamber. At that instant I saw the plunging colossus take one stride across a windfall fully 5 feet high. He went over it unchecked as casually as a poodle would walk over a match. I had a plain view of his shoulder, and held the ivory bead full upon the black hide.

An upheaval followed the shot. I saw the big bull collapse. His hind legs flew up into the air; they wavered to and fro as he struggled across the tree trunk, and I let drive again. Then I could see nothing more.

There was a moment's silence. My ears roared like voices in a swound.

"He's down! He's down!" screamed George.

He snatched up his hat and threw it down again. I ran toward him, and together we dashed toward the thicket. A monster head, crowned with branching horns, upreared beside the windfall. It was the bull making his last fight. He was turned toward us, vainly striving to rise. I rushed down upon him, and George yelled a warning. I jumped just in time, as the antler swung past my knee. But I was ready even then to jump on that moose and hold him down if he tried to run away.

But his running was over. He swayed back, and the struggle passed. He was still, his great head resting on the windfall, his horns resting back above his shoulder.

"Whoop!" yelled George. "Hurray! Look at those horns!"

I looked, and was aghast. I saw their spread as in a dream. I beheld their weight, and I—I hope you will pardon me. It took me twelve years to get to see what I saw.

George jumped up on the moose, cut a pigeon wing

TOTING OUT.

and fell off to embrace me about the neck. Then he pump-handled me as if I were a blushing bridegroom or a Congressman with post offices.

George left me. He leaped into the air and cracked his heels together.

"Biggest I ever saw," he cried. "I wish my wife was here to see 'im." Then he whooped again.

"Look at the bell—holy thunder!" George didn't exactly say "holy thunder!" What he said sounded louder. I looked at the bell. It was black, glossy as silk and fully 18 inches long. I have seen many moose, but never one at his age with a bell as long as this.

"And his ears!" yelled George. But, in truth, they were not beautiful. One was split half-way down to the butt; the other a finger's length. Moreover, his forehead was cut and slashed as if he had been tilting a mowing machine. Many of the scars were fresh—still unhealed, in fact.

"I'm going to measure those horns right away," said George. "How much do you think they'll spread?"

"Five feet," I answered.

"Seven," said he, promptly. He fished into his pocket till he found a sulphur match. "It's just 2 inches long, that match. All of 'em are."

With the match we made a foot rule out of a roundwood stem. Then George cut a pole with his axe and

measured the spread. With the foot rule we made it 64 inches. A tape measure at the taxidermist's makes it 65. Both horns were broken off at the points; otherwise they would have scaled close to 70 inches.

I regret that we had no tape to take his measurements. I think it would have been worth while. From former experience, however, I judge he stood quite 7 feet at the shoulder—perhaps a little more. He was not apparently a heavy moose—that is, heavy in appearance. He seemed to run to bone. But one hindquarter stripped from the saddle, and with the shank off, weighed 86 pounds. We estimated that his weight in life would be close upon a thousand pounds, a guess verified by the statement of my New York butcher. He says from the size of the moose that it would dress fully 750 pounds. I have never yet seen a moose weighed, but I am doubtful about the tales of 1,200-pound and 1,400-pound bulls. One moose I saw in Maine was estimated in the woods to weigh 1,100 pounds. On the railroad scales it weighed 650.

When George and I tried to turn over the bull we had our hands full. We tugged and strained for ten minutes before we succeeded in dragging its forefeet from under the windfall so that we could roll it over.

After it was all done, and the excitement gone, the reaction brought a pang. I looked upon my bull and I confess a regret that this great creature, once so strong and eager, so mighty and unswerving in power among its kind, had fallen because of me. I said as much to George.

"Huh!" he scoffed. "He was a derned old bully rascal. Look at those ears of his. He was just always looking for trouble."

I passed with my regrets.

We found the Hon. Chauncey at camp. He had seen his usual moose.

"Drat!" sniffed George, throwing his axe into a corner with an assumption of disgust. "It's enough to make you sick. Drat this country, anyhow."

Then he hid his face in the woodpile and I saw his shoulders heave.

"Well, anyhow," said the Hon. Chauncey, "I think some one got a shot. I heard the dickens of a banging south of us."

"Bob's been shooting, mebbe," said George.

The robust Robert entered.

"Who was that shooting?" he demanded.

George tittered.

"I'll bust in a moment," said he, appealing to me.

The cat was out of the bag. They sat with open mouths till our tale was done. The Hon Chauncey, ever cheerful in the face of diversity, offered congratulation; the robust Robert looked dazed. He knew moose, and the size of this overwhelmed him. As for George, he clattered about, upset the dishes, fell upon the stove and enjoyed himself thoroughly.

Then we talked over the fortunes of the Hon. Chauncey and the robust Robert.

Theirs was hard luck indeed. Together they had come upon a big bull lying down, utterly unmindful of their presence. When they were within twenty-five paces the Hon. Chauncey fired. The bull got up and fell down. He arose, and the Hon. Chauncey knocked him down again. The third time the bull arose for the third time he was fired upon by both hunters, and for the third time he fell. But when he arose he scuttled into the bush and the two took up the chase.

There were many discussions as to the propriety of this. George and I, from our elevated positions, contended that they should never have followed so soon. We were pooh-poohed, and in a tiff we retired into our shells. They followed the moose for four miles, and in that time he stampeded three other bulls and a cow. Two of the bulls joined with him, and when he came to bare ground, they tracking the entire distance by the blood upon the snow and leaves, he had stopped bleeding. There they lost him.

The Hon. Chauncey afterward got a moose with a small head. When we skinned the big bull we found his interior economy a dreadful disorder. Both shoulders were broken, both hips fractured, his heart was cut in two, there was a bullet through his brisket, another through his paunch, and six of his ribs were cut in twain. Three of the bullets we found; the others went through him or were pulverized against the big bones. In odd places we found scraps of metal jackets and fragments of lead.

George says the way the .30-40 shot was a marvel. It had rained just enough before we saw the moose to moisten all the boughs. He knew I was hitting, because every time the gun fired the tremendous vacuum set up by the bullet drew all the moisture in its train. The water in the air and from the bushes, he said, just fell in behind the bullet, forming long ropes, that reached from the barrel to the bull's flank. It looked like shooting with a squirtgun, he declared. I offer no substantiation of this. All I could see was the moose.

I might say in conclusion that George recovered the stone he dropped during the excitement. But he never got his partridge. Still, I don't think he cared.

MAXIMILIAN FOSTER.

[The measurements of Mr. Foster's record trophy are: Spread 65 inches, circumference of beam 12 inches exact, breadth of each shovel 11¼ inches, right antler (inside measurement) 38½ inches, left antler 37½ inches; weight 110 pounds.]

New Jersey Wardens Active.

TOMS RIVER, N. J., Dec. 14.—On Saturday last Fish Wardens A. J. Rider and Howard Mathis arrested R. M. Darrack and G. R. Newbold, both of Atlantic City, for shooting ducks from a sailing vessel anchored at Main Marsh thoroughfare. The prisoners were taken before Esquire Burton, at Tuckerton, who fined them $20 each with costs.

On the Saturday before, Nov. 25, Bennett and Parker, of Forked River, were arrested for gunning in illegal blinds. They were brought here and fined $25 each with costs, by Justice Low.

Wardens Mathis and Rider arrested three men for sailing after and shooting at ducks on Great Bay last Tuesday. They were fined $20 each and costs.

Parva Domus; Magna Quies.

BROOKLYN, N. Y., Dec. 7.—*Editor Forest and Stream:* I inclose herewith one of the results of publishing that beautiful bit of nature, "A Country Road." Framed in pine boughs, on which the native growth of cones still adheres, and sent to an appreciative friend, it brought back by way of response, in part, this, which so truly describes a part of the charm of camp life that I could not be selfish enough to keep it all to myself, but ask that you send it to the multitude of nature lovers, who will feel the truth of the "peace," and, as I believe, thank you for giving them the opportunity of seeing some of their own thought very thoroughly expressed in these verses. Not alone "Beneath the huge Ben More," but in forest nooks and by woodland lakesides far away from the "madding crowd" these verses might be framed for answer to the questions which beset such as love for a time to dwell alone, "Don't you get lonesome?" "What do you find to do?" "I should think it would be dreadful," etc. Of course, no one can tell all the charm, but Prof. Blackie comes as near to the heart of it as any person I have ever heard talk, or whose description I have read.

D. A. JORDAN.

Dr. Jordan's inclosure is a copy of Prof. Blackie's poem, *Parva Domus; Magna Quies*—"little dwelling; great peace,"—which so admirably expresses the charm of retirement in a woodland camp. The poem is taken from the New York Times Saturday Review, to which it was sent the other day by C. F. Laurie, of Erie, Pa., with this note:

"'Parva Domus; Magna Quies,' which the Rev. W. N. Harris inquires for in the Times Saturday Review, was written by John Stuart Blackie, Professor of Greek in the University of Edinburgh. The manuscript, soiled by the fingers of the compositor, was the gift of a friend, and had lain forgotten for years until rediscovered some few weeks ago. The poem, I think, first appeared in the Scotsman, Edinburgh. It is dated from Loch Baa, Mull."

Parva Domus; Magna Quies.

On a little grassy knoll
Beneath the huge Ben More,
Where the loch's clear amber waters
Lave the white and pretty shore,
I have built a little dwelling
Without pomp or state,
For smallness quite excelling,
But oh! the peace is great.

From the hot and dusty tumult
Of the men that rule the land,
From the pageant of the Park
And the rattle of the Strand,
From the weariness and worry
Of contention and debate,
I am sheltered, I am hidden,
And the peace is very great.

From the knocking and the ringing
Of the beggar with the sore,
Where every man is bringing
Every business to my door,
From saying yes or no
To seas of sullen fate,
I am sheltered, I am hidden,
And the peace is very great.

From the doctrine and the dogma
Of each lofty-fancied fool,
Who could take the great Creator
(If Creator he) to school,
From a thousand maggots swarming
In each quick and eager pate,
I am sheltered, I am hidden,
And the peace is very great.

From the carping and the grumbling
Of the spiteful and the small,
Who when mighty things are tumbling
Love to see the mighty fall;
From the lust of hot Reforming
In the Church and in the State,
I am sheltered, I am hidden,
And the peace is very great.

* * * * * * * *

Then fare thee well, great city's din,
The tumult and the throng,
For a moment, and a moment,
To myself I will belong;
In my little mountain dwelling,
With no pomp to guard my gate,
I am hidden, I am happy,
And the peace is very great.

And right pat with this is a little note in the Philadelphia Press, which tells of the gunning cure for the blues:

He had his gun case in one hand and a grip in the other, and was making his aay to the Broad Street Station. "I'm going away to get rid of the blues," he said.

"You see," he went on, "this is my unvarying cure," and he nodded toward the gun case. "Don't often get the blues—blamed seldom, in fact. But when I do get them—well, I get 'em for keeps—take right hold of me and unfit me for business, pleasure, intercourse with my fellow men—everything! And the only thing that cures me is a week's gunning. I go off somewhere and tramp around in old clothes with a gun and a couple of dogs for my companions. And after I've gotten away from cramped-up cities and have roamed around among hills and in thickets, and scrambled over rocks and sat me down by little streams—well, I forget the little things of life—little troubles, little vexations, little men, little women, little aims, little everything. For everything around me is on such a big, broad scale—mountains, hills, valleys, trees, sky—that my vision gets big—and I see more and see differently.

"And in a week's time I'm a different man—made all over in nature's big workshop."

In Old Virginia.—VI.

"MAN want to see you, suh," said Governor one morning as we lingered around the breakfast table planning for the day's pleasure. I was not expecting a visitor, but there could be no doubt who the message was intended for, as the little fellow stood erect and soldierly in the door looking me straight in the eye.

"Who is it?" I asked.

"Bin, suh," he replied.

"Who?"

"Bin, suh."

I looked at my hostess for enlightenment, but she shook her head negatively, so I resumed the conversation with the little messenger.

"Bin who, Governor?"

"Dunno, suh; dis Bin; he black man, suh."

And then I understood that a man of the genus Africanus, whose cognomen was Ben, desired an audience.

"Do you know what Ben wants?" I asked.

"He say he know where dey a gang of tuckeys, suh."

This interested me at once and I quickly followed my small boy to the back yard, where I found Bin, a tall, slender, yellow darky, accompanied by a tall, slender, yellow dog.

The man's voice was musical and low pitched, and the dog moved about in a quiet yet alert way. They impressed me at once as a pair of typical woods hunters that thoroughly understood their business and each other. After a respectful salutation, Ben proceeded in a low, sweet voice to tell me that having heard that I was visiting on the plantation and was fond of hunting, he had come to ask me if I would like a turkey hunt, as he gave that branch of the sport his entire attention and knew about every gang of turkeys in the neighborhood and would be glad to take me out; that if I cared to go he would hunt in the afternoon until he roosted a gang and then take me to the blind early in the morning for a shot.

Assuring him that a wild turkey hunt was exactly what I was longing for, we arranged to go the first morning after he had succeeded in roosting a flock, this being the method of hunting that wary bird.

"Roosting" turkeys consists in finding a flock late in the evening, after they have gone to roost, and scattering them as much as possible in all directions, then building a blind of brush and limbs near the spot from which they scattered.

In this blind the hunter must be at daylight the next morning with a turkey call, and if a skillful caller he can call one or more turkeys within range as they seek to get together again. This is about the only way to outwit this wary bird, that can see, smell and hear better than anything that lives in the woods, be it fur or feathers.

Ben had the expected good luck, finding his turkeys the first afternoon out, and came to the house about an hour after dark of the same day to say that he had scattered a good flock, built his blind and would come for me about two hours before day next morning. Arrangements were made for an early breakfast, and the stars were shining brightly when I made my way down to the stable, where Ben was assisting a sleepy boy to saddle my horse, next morning. It was about 3 o'clock and day would not break before 5, so Ben assured me that we would be in our blind by the first streaks of dawn. The horse saddled, we set forth down through the woods, Ben leading the way on foot. It was so dark I could not see my horse's head, and laying the rein on his neck I trusted him to follow the guide, while I smoked and enjoyed the novelty of the situation.

It was a crisp, clear, frosty morning that made the blood tingle. I found my man the quiet woodsman expected, with none of the usual garrulousness characteristic of his race. An occasional low-spoken suggestion regarding obstacles in the road was all he vouchsafed, as: "Log in de road, suh; pull to de lef'," or "Limb, suh; ben' low."

When the first faint gray appeared in the East, indicating the approach of day, I proceeded to get acquainted.

"Have you killed any turkeys this season, Ben?"

"Yaas, suh; three."

"How many times have you been out this season?"

"Foah times, suh; killed one one time an 'two de othah."

"Did you kill many last year?"

"No, suh; didn't hunt none las' year."

I wished afterwards that I had stopped there; but knowing nothing of my man's past history and wondering that such a born sportsman should let an entire season pass without going out once, I questioned further:

"You did not go hunting once last season? Why was that?"

"I was in jail, suh;" he said quietly.

I was sorry that I had asked the question, but it could not be helped now, and I concluded to risk further questioning for my personal satisfaction.

"What were you convicted of, Ben?" I asked.

"Stealin' meat, suh."

"Did you steal the meat?"

"No, suh, I did not; but dey proved I did."

And I believed then that they had convicted the wrong man, for Ben had none of the earmarks or characteristics of a meat thief—he was a sportsman. A few moments later he announced that we were as near the hunting grounds as we could go with the horse, and if I would dismount he would put the horse in the stable of his brother-in-law, whose cabin was near, and we would proceed on foot. The horse disposed of, we started down through a piece of fine timber, and I now observed for the first time that we were accompanied by the tall yellow dog I had seen with my companion the day before.

"Won't your dog scare the turkeys and interfere with our hunting?" I asked.

"Oh, no, suh; he will be as quiet an' keerful as we is, an' help us a heap. He is de bes' tuckey dog in all dis country an' always goes wid me. When we git in de blin' he lie still twel we shoot, an' den if de tuckey is only winged he will run him down fo' us. We can't talk none aftah we git little furda 'long, an' you mus' 'scuse me, suh, if I des make you sign wid my han'."

Just before reaching the blind we came on one of the scattered turkeys; but the rush of its wings as it pitched out of the tree and flew off was all the evidence we had, as no glimpse of him was possible in the faint gray light of approaching dawn.

As quietly as possible we slipped on down through the

woods and entered the blind, which was a circular inclosure of brush and limbs with one opening, which Ben closed with a large leafy limb after our entrance. The dog entered with us and quickly curled up in as small space as possible in the spot indicated by his master. Ben and I took opposite sides of the blind and he produced his turkey call. He used the box and slate call, a very ingenious contrivance, probably familiar to all readers of FOREST AND STREAM. Day was fairly breaking by the time we got fairly settled in comfortable positions, and there was light enough to distinguish objects within gun shot.

With a swing or two of his wrist to get the motion, reminding me of the preliminary attack of the professional violinist, Ben brought the box and slate together with three quick touches, producing a quit, quit, quit, that was positively an improvement on nature. As the clear sound rang out on the still air and died away down through the shadows of the heavy woods, in spite of a prejudice against calling anything up to shoot instead of going after it I found my blood tingling and my heart throbbing with excitement. One, two, three minutes we waited, and not a sound. It was fully ten minutes before Ben called again, and the echoes of the call had not died away before a quick answering "Put! Put!" was heard from a turkey near by. I was not sure of the direction and turned to my companion, who showed me with his eyes that it was a little on my left. Setting my face in the direction of the answering sound, I slid the stock of my gun well up toward my shoulder, so that I could take a firing position without moving. Ben was scanning the ground in all directions, leaving me to watch the line of the expected approach. The dog was shaking all over, and his eyes fairly blazed with suppressed excitement. The next few moments I felt would be full of the glory of game bagged, and was wondering whether it would be a lordly gobbler with a long beard or a fat hen, when, "Whoop-ee!" came a loud shout off to my right, followed by ringing strokes of an axe on a tree. Ben sank back with a groan, as though in pain, and as the yell was repeated, followed with more blows of the axe, he raised to his feet and faced the direction of the sound.

"Who is that?" I asked.

"Some fool niggah, suh," he said; "he goin' to wuk, suh, an' can't keep his mouf shet."

And as the yell rang out again, ending in a shrill "Ye-oo-hee!" his wrath fairly boiled.

"I sho' do wish I was clos' to dat niggah wid a han'ful of rags. If I didn' stop his mouf an' choke all de fool holler out of him. I mos' suttenly would, suh."

Pitching aside the branch that closed the opening of our blind, Ben strode forth, followed by the dog."

"We got to hunt 'em now' suh," said he; "dat our onliest chance."

Taking a course in an opposite direction from the "fool niggah," who was alternately chopping and yelling, we set out on what I felt to be a rather hopeless quest. We had traveled about a mile from the blind and were slipping along through the heavy timber when a turkey pitched out of a big pine tree just ahead. I was carrying my gun on my shoulder with my thumb on the safety and was not ready, when Ben took a quick shot with his big muzzle-loader. He missed and so did I the first barrel; but my second broke a wing and brought the turkey down running. I was trying to crowd in fresh shells when the dog, like a yellow streak, shot across, from out at our left, and took the bird's trail.

"Come on, suh," said Ben, and off we dashed in the direction they had gone. The pace was too fast for me, but before I was entirely exhausted I came on them, the dog sitting quietly by while Ben smoothed the feathers of a fine young gobbler.

"Dah he is, suh," said the delighted fellow; "a fine fat gobblah; an' it was a good shot dat got him. I didn't do nuffin' but make him fly fastah; I ain' no wing shooter, suh."

When the turkey had been swung over his shoulder by a heavy cord, Ben suggested that as it was yet early in the morning, perhaps we might find the "mossheads" and get a shot if I did not mind a rather long tramp. Upon my assurance that I was willing to undertake a long tramp with the possibility of another shot we started off again. I supposed a mosshead was some kind of a turkey, but had never heard of them before, so proceeded to question Ben as to what and where they were.

"De mosshead," he explained, "is a tuckey wid a mossy lookin' head, an' he won't come to nor answer a call. You can't git him 'less you dis run up on him an' kill him on de rise. Dis gang we goin' aftah has five in hit, an' dey all big gobblahs. I done jump dem tuckeys foah or five times, but can't hit 'em, so I is layin' off to track 'em when snow come an' shoot 'em on de groun'."

Arrived at a dense piece of woods grown up in underbrush until a rabbit could hardly get through, my man posted me in an open field on one side, and he and the dog skirted around to come through and try to flush the turkeys so that I could get a shot as they flew over.

"De dog will bark, suh," he explained, "an' I will shoot if we run on dem, so yo' will heah dem in time to git reddy."

The field where I was had been in grass and ran up to a fence which divided it from the woods. There was a deep hollow about half way down, where ran a branch through a thick brier patch; but on the other side of the branch the land rose steeply to a level with the point on which I stood. I figured that the turkeys would pass over me if flushed on my side of the branch; but if from the other side of it they would pass over the opposite high point of the field, necessitating a quick run down into the hollow and up the other side in order to get a shot.

I had waited some time without hearing anything, when a short, sharp bark sounded from the woods, and the next moment a turkey rose over the trees and started in a direction that would take him over the opposite side of the field. Hoping that there would be others following a little later, I dashed down the hill to try to get to the other side by the time they came. The ground was rough and needed all of my attention; but I could not take my eyes off of that magnificent bird sailing away just ahead. About half way down the steep incline I hung my foot in a vine and made the rest of the descent on alternate ends. Just as I reached the bottom and pulled up with a crash in the brier patch I heard the dog again, followed by the boom of Ben's big gun. Scrambling to my feet I dashed on through the briers, scattering bits of cuticle and clothing, and was panting up the hill when another turkey sailed over just out of range. With lungs pumping as though they would burst, I toiled on, hoping that I might yet be in time for one of the five, as only two had passed. Before I had run ten steps more I saw the third one coming in the same line of flight the others had pursued, and putting on a final spurt made position just as he sailed over the trees into the open. Gasping for breath and with my whole body shaking and trembling, I drew on the fair mark. For a moment my gun jerked erratically round in a hopeless manner, and then steadied a moment just where I wanted it. I knew the bird was mine when the gun spoke, and felt no surprise when he pitched down with a crash 50 yards away. No more flushed in my direction, but I felt fully compensated for my long tramp and hard run.

Half an hour after, when Ben worked down to where I was lying by my fine old mosshead gobbler, I had only recovered sufficiently to begin to take an interest in the missing sections of my skin and apparel scattered so carelessly in the brier patch below. My face felt much disfigured, and I was not much surprised when Ben inquired very anxiously:

'What done hu't yo' dat way, suh, an' toh you' close beside?"

When I assured him that my wounds were only scratches and that I had a turkey he was delighted and unsparing in his praise of my skill.

"W'y, suh," he said; " all dem tuckeys flush rite 'long one aftah de odder, an' how you run 'cross from dat fah side time to git one, I can' see. Yo' sholy mus' run like yo' shoots, suh."

Arrived back at the brother-in-law's, where we had left my horse, Ben concluded to stop there for dinner. Tying a turkey to each stirrup leather, he set me on the straight road home, calling after me assurances that he would be "proud to go ag'in, an' thank yo', suh, fo' dis hea," "dis hea" being his share of the game, which I made him take in the current coin of the realm. Governor spied me as I rode up to the gate, and issued a call that brought all hands and the cook to welcome me. My success was generally applauded and congratulations offered. When I had turned my horse over to a boy and loaded the two turkeys into Governor's arms to be proudly carried to Aunt Ellen, I turned to enter the house to remove, as far as possible, the very evident signs of roughing it from my clothes and cuticle before any one had time to critically inspect and remark on the same, but I was not to escape entirely.

"You hunted in rather rough country, did you not?" said my hostess.

"Yes, rather," I replied.

"Did you shoot the turkeys you brought in?" she asked, with the accent on the word "shoot."

"Why, certainly. How did you think I got them."

"Well," she slowly replied, scanning me up and down, "I thought from your general appearance that you might have run them down, as you tried to do that fox a few days ago; but probably that is a mistake on my part. Hurry on, now, and get ready for dinner, and you can tell us all about it later on." LEWIS HOPKINS.

A Samoan Christmas Feast.

THAT there is no good hunting in this account of the fashion in which the Samoan savages keep the great festival which Christianity has brought to them is all Talolo's fault. Yet after all it does not seem quite fair for me to lay all the blame on that cheery companion who was ever ready to propose new exploits for me in the jungle with that light hammerless "shoot gun" which he coveted so greatly that to be in its company was happiness itself for the boy. Talolo had proposed an expedition after big game, even the biggest on his island; he had led me to the most likely covers and runways; that we drew blank was a matter beyond the lad's control. He was fully as disappointed as I.

For some time Talolo had been in the dire disgrace which dogs the steps of the malefactor. There had been one glorious day of tame shoat shooting in the compound. Tanoa had tiptoed into the house and brought out my gun, which he handed me at the breakfast table out on the veranda with the information that the compound was fairly full of pigs in defiance of the solemn law on the subject. The multitude of swine was not legion; it resolved itself into four impertinent and grunting little piglets, each doing its porcine best to root up the few flowers which I could succeed in stimulating into growth in the salt air of the beach of the South Sea. It was a little close shooting with a single-barrel and cartridges loaded with bird shot to bring all four little pigs to the untimely end which their assault on my scanty beds of sweet peas entitled them to. But it was done, and Talolo with much shouting of my prowess cast the carcasses over the hedge to form a feast for all Vaiala town. It turned out that this was not fair hunting. Talolo had sneaked down to the next village on Matautu Point in the early dawn and by savage art and treacherous wiles had beguiled away from their own place the young pigs of that community. Most of them got away from him, for it is no more easy to drive a pig in Samoa than it is in other lands. Yet he was successful in cajoling four to leave Matautu and come to the perilous pleasures of Vaiala. These four piglets he had insinuated through the hedge and given them a single taste of the forbidden delights of rooting up my flower beds where they met their fate. Unfortunately for young Talolo some one had brought this guilt home to him; Toomalatai, the chief of Matautu, visited prompt castigation on the offender and thereby made proof that a one-armed man can hit just as hard as a more perfect specimen of humanity. More than that, Toomalatai complained to the chiefs and elders of Vaiala, and it became necessary to discipline the boy, more for being found out than for his original offense. Poor Talolo's punishment was that he had to work. It was saddening to see him about the village divested of the gay colors which his taste ran to in his waist cloths, to see his head tied up in a banana leaf, to watch his chagrin when he was caught in the most unusual act of really doing something. It was a sore trial. One might just as well expect to find kittens industrious and butterflies thrifty, as to think that Talolo really liked work.

But the term of labor expired, Talolo again donned his gaudy attire, and with his usual air of confidence clicked open the gate of the compound and settled himself by me on the veranda.

"Tamaitai! How many days to-day?"

I thought that Talolo had come in to consult the calendar. The Samoans never have calendars, and are forever consulting their white friends to find out what day of the month it is when they have a letter to write. Therefore, I had no difficulty in understanding what Talolo meant in the somewhat incomprehensible English which he was trying to learn from association with me. So I told the boy that it was Dec. 21.

Then he plunged into calculation and proved to me that Christmas was no more than four days off. It began to be manifest that the calendar was worrying Talolo on other grounds than the needs of epistolary correspondence. What he was really after came to light in his next remarks:

"Pretty soon bimeby one day Kilimasi next day, mebbe so, we two go to bush and I, you take shoot gun and we kill pulumakau and pig for eat for me for you."

Talolo's English was always of the sort that takes a lot of understanding, and in this case it was only by having him say it all over again in Samoan and translating that I could get at his real meaning. What he was after was to convey to me an invitation to go with him a-hunting on the day before Christmas on the chance of bagging a wild cow or swine. Talolo could not have thought out any more attractive lure to toll me to the wild mountain tops. I had heard tales of the fierce charges of the cattle which had been growing wild for several generations in the most inaccessible fastnesses of the mountain solitudes, of the savagery of the old tuskers in the bamboo thickets, of the caution with which one had to seek the game, and the need of shooting the charge of buckshot in the single instant of the fierce charge. Would I go to the bush with that in prospect? Talolo would take me there or anywhere that promised results "good for eat for me for you," and up to the last it was only on that basis that the benighted heathen could appreciate sport.

It is just as well to explain that on this Christmas Eve hunt we drew blank; we did not even see a trail. And the same ill luck pursued us throughout; from first to last I had no chance to stop or even see the rush of the big game. The day before Christmas was a frightfully hot day; not a breath of wind was stirring and there was more than a promise of rain at the beach. Back in the hills it showered brief waterfalls all day, and even when it was not raining, one got just as wet in the steaming mugginess. We followed the main crests of the spurs of the main hills as far as possible, and Talolo went scouting down to the bottom of every intervening gully that was not too perpendicular for climbing. It was all without avail; the wild creatures seemed to have vanished quietly somewhere out of the wet.

But the ill luck of the hunters did not cause any lack of supplies for the next day's feast. The Samoan takes kindly to holidays for two very compelling reasons: one that he does not have to work on holidays, the other that such a day can be made the excuse for a hearty dinner. To be sure, no Samoan ever does work, and he is always eating the heartiest of dinners, but the presence of the holidays in the calendar sort of encourages him to follow out observances so thoroughly in accord with his inclination. The elements of that feast and some of the incidents may be seasonable reading now that it has been made clear that the fairest kind of effort has been made to get some hunting into it.

As soon as it was light enough in the morning to see one's way about, there was heard the clear, sharp ringing of the native drums of gouged out billets of wood which boys carried to every part of the village with incessant din. The wooden drums had not fairly stopped when the unmelodious church bell began ringing in the belfry of the native church. After the service in which the Samoan pastor delivered a seasonable sermon, the congregation adjourned to the village green, each person fetching out from the church or some nearby house a floor mat on which to sit. Then, from one group and another, the young men scampered to the house of the chief and threw on the ground some article of use to the pastor. It might be a bunch of taro, a brace of chickens, a young pig, a few yards of calico, even a piece of silver, which was rare in the extreme, and never was of larger denomination than a shilling. Each gift was shouted aloud with the name of the donor and its full amount, the announcement being proclaimed by the official talking man of the village. When the last donation had been cast on the somewhat considerable heap, the young men descended on the pile and assorted it into its component elements of fish, taro, tins of meat, calico, turmeric, and so through the catalogue of objects of insular utility. The reckoning of each of these heaps was reported to the village speech-maker, who stalked across the town green to its remotest limit, where he took his station with his long rod of office. Thence he shouted his formal speech of presentation on behalf of the town of these few articles to their pastor. Then from the front of the chief's house a younger orator bawled the ceremonious oration of thanks on the part of the pastor. Then there was a distinct set of speeches over the contribution which I deemed it politic to make with an idea that by that I might secure the assistance of the pastor in checking the petty depredations unavoidable to living in the heart of a native community.

After all this the village settled down to its customary quiet for a time, the different families retiring to their own houses for breakfast. It was during this period that the domestic presents were interchanged between house and house, each family clubbing the efforts of its members to present some one article to each other family. In no long time the alleys of the village were gay with rainbow umbrellas (they were particularly in favor that season with the leaders of South Sea fashion, although in more civilized towns they would have been the signal for a riot), with the latest barbarity of colors from German looms, with thrilling velvets and passionate satins. Samoan gifts run to the decorative values as applied to things to wear, possibly because so little is worn by the islanders that things are looked upon as in some sort evened up by making that little as prominent as possible.

Then came my turn. In the strict order of rank and following in the most formal fashion the intricacies of the ancient Samoan custom, each of the families of the village sent its representative to my veranda to give and to receive the presents which were to be interchanged. In the case of Samoan gifts, and they are constantly making a parade of giving, there is not the slightest element of generosity. Every gift must be repaid in kind and one makes public confession of being very niggardly unless the return far exceeds the value of the gift. By judiciously lavish generosity a Samoan family may very readily squander itself into a condition of extreme affluence. The faithful Tanoa was my personal body-guard and speech-maker and guide in general through the mysteries of Samoan conduct, all this with unwavering cheerfulness year in and year out for a shilling a day. He was greatly concerned that I should come through the Christmas gifts with credit to him, and he had many long conferences with me as to the proper amount of my return presents. After he had suggested what in his judgment was a really creditable gift to come from me, I made a bold stroke for the reputation of being free-handed by calmly doubling Tanoa's estimate. Even at that it did not bear very heavily. The full schedule of the return gift was this: One tin of salmon, one tin of corned beef, one pint bottle of kerosene, eight ship biscuits, running that number to the pound; one box of matches, two cigars, the latter being Mexican rope at $1.75 the hundred. In the presents for the two chiefs and the principal talking man of the village I included an outing shirt for the men and calico enough to make a Mother Hubbard for the women. It's always just as well to pay some consideration to rank even though it be bare foot. In the case of Chief Patu, my freakish Talolo's father, this addition led to a domestic tornado. Salatemu happened to be Patu's wife at that time, and naturally claimed the dress pattern. One of the other Mrs. Patu grabbed the goods and held onto them on the plea that she was the chief's wife also. Patu couldn't get the woman to restore the calico, and was forced to make it up to Salatemu by giving her his outing shirt, which thereafter she wore on all occasions of ceremony.

The presents which came to me were assorted enough to stock a museum. There were models of houses and models of canoes; there were mats and strips of native cloth made from bark; there were baskets and fans and clubs and shell fish hooks and dancing skirts and shell necklaces and boars' tusk armlets. Tanoa had done his work well, for I had told him that this was the kind of thing I preferred in my Christmas presents, and he had evidently issued orders to that effect in the dense incomprehensibility of that native life which seems so open to the view.

There was a wearisome sameness in each presentation. The ceremony took place on the veranda, for every man, woman and child had dressed for the feast in a double allowance of cocoanut oil, which so glistened on their skins as almost to suggest that they had been buttered. That would be fatal to furniture. I could never get the oil out, and it might damage many a white dress or the dress uniforms of the naval officers on their visits of ceremony. As it was, and even with the extra precaution of placing double thicknesses of mats on the veranda floor, the oil struck through and left great grease stains which only slowly wore out in the rainy season. In the order of their social state each household called in turn, the heads of the house mountaing to the veranda, the children remaining outside the gate of the compound, where they found seats on the big fragment of the mast of the wrecked Trenton. First came the compliments and the proper wishes for the day. Next came a long rigmarole about the great love of this family in particular for me, and a long statement of reverses and poverty which would have done well in a bankruptcy schedule. None the less the family had got together, so the speaker sadly said, a very few worthless trifles that had no value except to show their willingness to do the proper thing. They were not worthy, he continued, to be brought into my presence, and he would order them to be laid at the far end of the veranda, where my servants could easily sweep them out with the rest of the rubbish. It is impossible to exaggerate the professed humility which Samoan etiquette prescribes; everything given must be scandalously belittled just as everything received must be lauded to the skies. As a race, the Samoans are as vain as peacocks, and as proud as Lucifer; that only adds to the incongruity of their haughty attitude, while the stream of abject self-abasement is flowing over their lips in set and ancient phrases. At the proper point in the speech one of the boys brings in the gifts and makes a show of acting when he throws them carelessly down at the far end of the veranda.

Here is where Tanoa shows himself a treasure, for he is of the orator rank, and knows thoroughly every one of the proper things to do. It's all acting, but Tanoa keeps a perfectly straight face, which is something that I cannot always do. Without Tanoa's constant care I should commit a hundred social slips a day, which the Samoans would never forgive, for they never make any allowances for difference in customs. It has happened in the islands that some who harp upon their intimate acquaintance with the native customs and attempt to follow out by their unaided efforts all the niceties of ceremony more than anything else for the sake of impressing the globe-trotters who once a month get their six hours in Apia as the foundation for another chapter on Samoa—it has happened that such people have regularly committed solecisms which have made them either scandalous or ridiculous, and all for lack of a competent orator as master of barbaric ceremonies. As these people were absolutely in private life, their slips made no difference to anybody, but in the official circle it was quite necessary to have a capable speech-maker in order to avoid such errors.

Tanoa advances to the heap of offerings with deferential looks, and makes a show of knitting his muscles. Then putting his arms about the pile, he makes a vain bluff at lifting it, and failing to stir it. It's all bluff; the other boy has just been carrying these things around without difficulty, and throwing them down as though they were no more than feather weight, but it's part of the game that Tanoa knows so well and does so perfectly. Failing to lift the weighty heap, he lifts each article to his head in formal reverence and sets each forth in order. When they are all lined out to make the greatest show possible, he rushes out into the front yard, which, according to the Samoan custom, is the place for all the ceremonies of my house to be conducted; in fact Tanoa begrudged every inch that I tried to have for my poor struggling flower beds—he said that flowers were all very well in their way, but so long as he was my orator it was his duty to protect against any curtailment of the space where he could make his speeches, and where other orators could stand when listening to his eloquent remarks, and making their properly subservient replies. In effect, if flowers were wanted in that part of the compound, he would undertake to fill the bill with the flowers of speech. What with the barren soil and the salt air and the pigs and my orator, that flower garden had its foes. In tones that could be heard half a mile without any difficulty whatever, my good Tanoa proclaimed to the listening village that Patu and the Salepatu had endowed me with such and such precious articles, citing each by name and number of pieces with some word of compliment which could never be made too fulsome for Samoan hearing. All these goods were now on the veranda and the floor so sagged under the weight that he had ordered one of the house boys to run and set a strut beneath to prevent it from breaking through. That was a stroke of genius on Tanoa's part, and made him famous among the orators of distant communities even on other islands.

Returning then to the veranda, Tanoa brought me the best appearing of the articles thus published and passed it to me in order that I might take formal possession of my present by raising it to my head. This done, Tanoa returned the specimen to the display of the presents, and was then at liberty to make a speech setting forth the unfortunate poverty of the house and the insignificance of the family of which he, a common man and of no account, was the poor makeshift of an orator. While humility was the keynote of this oration, Tanoa so managed to couch his humility in grandiloquence as to make it most amusing to note the irreconcilability of theme with manner or known facts. This led up to the presentation of the gifts which had been prepared and were arrayed in convenient piles just around the corner of the veranda. Each tin can was announced in set terms, and when it came to the cigars, Tanoa chopped the end off each, scratched a match on the box which went with them, lit both cigars and passed one to the man and the other to the woman, for there is in Samoa no monopoly of the use of tobacco. As soon as the return gifts were in hand, the visitors scuttled away with no waste of time. On the village green just without the hedge of my compound the return gift was proclaimed by the village orator, and the next family was at liberty to present its gifts and receive the return.

By the time all these long ceremonies were over, and it is to be said that no length of ceremony ever seems tedious to a Samoan, the day was well advanced. All night long the pit ovens had been filled with bonfires of hard woods, tended all the night by reliefs of men. At dawn the rock lining of the pits and the cobbles which had been thrown into the fire were so snapping hot that a shellful of water thrown upon them after the coals had been scraped out would have served like the port fire that explodes a mine. Hastily the viands already prepared for cooking were heaped in this crater of hot rocks in wrappers of green leaves, and when each oven was full it was closed by shoveling earth on top of everything to a height of several feet. When the gift ceremonies were finished there was a distinct flavor in the air as of cooking, and when the savor of the viands has made its way through the overlying heap of earth it is usually held to be a sign that the meats are pretty nearly done.

With the opening of the ovens this account of a Samoan Christmas may fitly close. The rest would be but a chronicle of things to eat which differ in no particular from the daily fare of this savage folk, and therefore do not stamp the holiday meal as distinctive in any way.

LLEWELLA PIERCE CHURCHILL.

My Christmas Box.

ON the windward side of a steep mountain up in Monroe county, Pa., near the Pike county line, and still nearer to my affections, stands a four-room cottage, quite in need of its second coat of whitewash. A visit there by even a careful observer of the industries, successes and failures of our fellow man would most naturally produce the thought, what does the owner of this place do for a living?

My Christmas box from there would suggest the "sportsman farmer." The thought that prompted its being sent proves surely a friend. My first recollection is of my faithful guide. As the latter he has been to me essential; as the friend, I fear not fully appreciated; as the sportsman, by all odds a natural one, but as a farmer, an unknown quantity, until my box came. Since then, a real farmer of the old school, for modern methods and inventions have provided nothing for the easy cultivation of rocks, roots, stumps and rhododendron thickets.

Henry, my sporting farmer friend and guide, is a decidedly crude individual, little given, I fear, to "class meetings" and the "study of Wesley"; the trend of his mind is not of the spiritual; the things on his little patch of earth are conundrums of a practical sort, sufficient for his keenest thoughts. This condition of mind, however, is entirely and of necessity natural. The man who could plough and pray the same "moon" on that farm is not of our generation; the early Quakers would have let go their heavenward pilot wheels, had they settled in Pike county. I, one time at the close of one of Henry's outbursts of "speed" in venting his feelings over an escaping grouse that got its start in his neighborhood, remonstrated with him, and suggested he "get religion." By way of argument, he pointed to his small clearings, his high stone fences, his dilapidated and broken plough, his near-sighted near ox, his broken-horned off one, and asked me, where in —— in this happy land to plant religion.

This, however, is not meant to be a story of a Pike county farmer; it is meant to be of a Christmas box, and the effect it had on my mind; yet, to know the farmer is to get the cause; to read of the latter, the effect is given. Knowing Henry as I know him enhances the value to me of my famous Christmas box; it speaks so of a thoughtfulness and modesty born in man ("not much, but the best I have I send to you"); it reminds one of patience and toil, of endurance, of a manly, sturdy nature, always to be prized, whether found in the forest or ball room, of a "set principle," that, could it be mounted like a dead bird, would be a suggestive ornament for some of our legislative halls.

Inside that four-room cottage can be found the patient and tried Mrs. Henry and her three chubby boys; her contact with this busy world in which we live is naturally very limited; even the railroads have shunned the mountain on which she has chosen her home, and the stranger who passes her threshold is either "lost, strayed or stolen," but in any case would be hospitably received and welcomed.

Such is the isolation of this home, surely causing a lonely existence, and this being the case, does it, or did it, ever occur to us as men, and as sportsmen, how much our annual visit means to that backwoods fireside, how to them our stay is like the touch or glimpse of another world, how our coming is talked over while yet the leaves are green and the katydids are just beginning to chatter, and how we are still the subject for family and neighborly gossip when Henry's troubles are covered with snow, and stone fence could be built with his cider, and the game has left the barrens and gone into winter quarters? Do we remember them after the guns have been cleaned and put away, and the dog lies curled up by the open grate, and our children are listening for the tinkle of the bells, announcing another "Christmas morn," filling all our hearts with gladness and thanksgiving, and causing us to forget our friends on the mountain side? I fear memory pours itself into a funnel in order to concentrate itself into a small given space at home.

We use our Henrys at the rate of "two per"; they use us as a household word. My Christmas box has convinced me of the generosity of their natures, and the frailties and natural weaknesses of mine.

I didn't get to see Henry last fall, and my Christmas box coming just the same, convinces me that they missed the "fireside" part of my visit. That box, which will always be recalled with such appetizing pleasure, contained a peck of apples (and Henry has no apples, but is an excellent guide), a peck of beets (some of them showing the struggle they had getting through the rocks), a peck of potatoes (slightly disfigured), a big jar of mangos (simply perfect; they grow above ground), nineteen ears of pop-corn (perfect ears; they also grow in the air), three rabbits (killed in bed), three ruffed grouse (killed either at sunup or sundown, in a buckwheat patch or on a frost grape vine, while in the act of feeding). Henry is above all things a good shot in the uncertain light of awakening morn or declining day. This generous box of good things (always the best I have, I send you), representing as it did part of that year's yield, representing early and late hours of eager watchfulness, makes us all glad to know that away on that mountain side we were in their minds and in their hearts. A stony road eight miles to the railway to send my box had to be traveled behind a slow animal of an uncertain age, and retraced, but in that box, so carefully packed and carried so far, is "the best I have, I send to you."

THOS. ELMER.

ELIZABETH, N. J., December.

Christmas Chat.

CHARLESTOWN, N. H., Dec. 14.—*Editor Forest and Stream:* The shortened days of the closing year have been lately reminding me that it was some time since I had a friendly chat with my fellow contributors to FOREST AND STREAM, and the announcement of the death of Antler in the current number, received this morning, recalls the fact that I have lately turned over the seventy-sixth page of my earthly calendar, and that it behooves me to "take time by the forelock," if I have anything more to say, and to send my greetings and wishes for a "Merry Christmas and a Happy New Year" to those who still remain to enjoy the weekly visits of what my better half calls "my other Bible," and which, by the way, she enjoys nearly as much as I do myself.

Your leading editorial on "Wind Farms" opens the question on which I have been thinking of writing for some time past, very conveniently for my purpose, and that is, the enormous amount of misinformation distributed to the public, not only by the daily press, but the publications of a more pretentious character, and I was particularly delighted a short time since by our friend Cheney's "exposé" of the erroneous and absurd statements published in regard to the introduction of American fishes in Europe. Had Mr. Cheney known the real standing of the paper from which he took the article on which he commented, as well as I do, he would not have been so much surprised as he appeared to be in finding the article in its columns, for it has long been known among the older members of the engineering profession by the simple cognomen of "The Unscientific"! I took it for a time myself, fifty years ago, when I was a young man, and engineering literature was in its infancy, but long since dropped it as containing nothing reliable or valuable for my purposes.

The next article of the same sort which struck me was Mr. Hastings' amusing commentary on "The Consul-General's Moose," and to these I may add, as unnoted, the various accounts which appear weekly of enormous moose from the woods of Maine and New Brunswick, to say nothing of those which come from Alaska, but which seem to be somewhat more reliable. The 2,000-pound myth of the grizzly bear seems to have died out in favor of the 1,600 or 1,800 pound moose, and that will probably vanish in time. It is a pretty good sized carriage horse that will weigh 1,200 pounds, and 1,800 will do for a fair ox, so the readers of these fanciful stories may imagine the size of the game accordingly.

I always believe, or like to, all I read in FOREST AND STREAM, and very seldom find anything which I cannot easily digest and enjoy, but that yarn recently about the trip to the Mad River Mountains rather taxes my credulity. Such changes in climate and fertility as are there described, in crossing one summit, from utter sterility to a green and flourishing valley, may occur in

some parts of the world, but are not laid down in my geography. Then, although only three days are consumed in the account of the ascent of the mountain, the horse is worn out with many days' travel, when they get up there, and the story don't hang together. I know that the eyes of wild animals reflect light, but I do not believe the eyes of a wildcat ever gave out enough to shoot at, though somebody once palmed a similar story of shooting a panther on to FOREST AND STREAM many years ago. Altogether, the story savored rather too much of romance and imagination for my mental digestion.

Per contra, FOREST AND STREAM has lately given us some delightful tales of adventure and exploration from the pens of Messrs. Burnham, Hagan and Hastings, which spoke truth in every line. I particularly enjoyed the account of the round trip to the headwaters of the Otttawa, and the Gatineau, and the one into the Adirondacks from North Hudson, and I may say the same of Mr. Talbott's graphic sketches of "Fishing Up and Down the Potomac," and was very glad to note the appearance of our old friend, Charles Hallock, the founder of the paper, in one of them.

I have not been in the woods myself this fall, but the reports I get from those who have are of the general absence of game, ruffed grouse especially, as come from all parts of the Eastern States, although grouse were reported plentiful in the summer. Like all your other readers, I welcome the appearance of "Sam Lovel's Boy," and am also glad that that other boy, who was "Only a Boy," has appeared in book form.

Mr. Spears must stir up that one of his up in the North Woods, and give us some more of those original and thoroughly boyish letters. With "the compliments of the season," yours ever, VON W.

SAN FRANCISCO, Cal., Dec. 10.—*Editor Forest and Stream:* It is a source of gratulation to myself and must be to the readers of FOREST AND STREAM, that my reference to the question of salmon has called forth from your well-informed contributor, Steelhead, such an able and instructive article in the recently received FOREST AND STREAM of Dec. 2, illustrated with cuts of the many varieties of that much misunderstood fish.

Although I have been a fisherman for the so-called salmon for years, Steelhead has shown me that I have really been ignorant of the fine distinction existing in the family. It is a great consolation and comfort, however, to learn from Steelhead that although in most instances I may have been deceiving myself under the impression that I was catching the true salmon, still, he has given the steelheads such a respectable character and standing in the family that I have no reason to be ashamed of them as poor relations, even if somewhat distant.

In reading the first part of Steelhead's article describing their relationship to the genuine aristocrat, the conceit was taken out of me considerably to find that all this time I had been wasting my energies on an inferior outsider, but the winding up of the article gave the fish such a respectable standing in the family that I felt consoled to find I had not been wasting my time on such a degenerate scion after all, and, thanks to Steelhead for such an indorsement of his character and respectability, shall have no compunctions about taking him into favor again, and giving him the benefit of my "distinguished consideration."

I shall cut out Steelhead's able article, which shall be my vade mecum and carry it in my fly-book ready at hand to enable me to give each fish I catch its proper status, and to determine whether I may be entertaining an angel unawares, or giving some degenerate member of the family a position and standing not its due.

I have been disappointed in not being able to make my anticipated trip to Navarro River up to this time. Just as I had made preparations, the heavy rains came on, and naturally producing a freshet and rily water, it was useless to go until there was a subsidence and clear water, and that is what I am waiting for, and acting on Steelhead's advice, shall essay the experiment and trial of the scarlet-ibis, and also of the large double gut fly that Conroy made especially for me, that have lain perdu in my fly-book these half-dozen years, provided the moths have not been less fastidious than the trout and have taken them at sight, or, rather, out of sight.

Moths in the Fly-Book.

Speaking of moths, I presume most fishermen have had an experience in that direction. I have unsuccessfully tried all means of ridding my fly-book of them. The last time I was in London I fitted myself out very elaborately in the way of fly-books, warranted moth proof. I did not have occasion to open them for several months, until essaying to show my outfit to a friend. All I found was a lot of naked hooks, without a feather on them. I am wiser now. I don't buy flies until I want to use them. I find it more economical to leave them for the tackle stores to look after until I have occasion for them.

Speaking of the fish tackle stores, what a temptation they are to a man to spend his money. I never go into one but what I buy a dozen things I don't need—am already provided with and never use. I can understand the passion women have for shopping—going from store to store to look at the new things, not always buying, but still wasting a good deal of money, as hubby realizes, forgetting that he gets away with as much with the nickel-in-the-slot machine for cigars and cocktails—he would not care to confess how much. This form of gambling has its fascination; in fact, most men are natural gamblers.

I confess I never can resist taking a chance in a raffle for a boat, a dog or a gun, especially the gun, no matter how many I may have hanging up that I never get time to use. Guns and fishing rods are to a sportsman what jewelry is to a woman—always wanting more. If he can't use them he can enjoy taking them down of a rainy day to oil them up and admire them.

Next to a handsome woman, give me a handsome gun. Although there may be similar characteristics, both are liable to go off unexpectedly, without warning.

PODGERS.

"BEHOLD THE FOUR DRAWN UP IN LINE."

Stubble Rhymes.

PRELUDE.

LET poets sing the valiant deed
On Mars' red field where soldiers bleed;
Be mine to perpetrate a jingle
Where shot and shell and game birds mingle.

November 6th was bright and fair
With frost and sunshine in the air:
To Cedar Lake the quartette flew—
By rail—to brush the early dew
In search of quail or anything
Called game that might take wing.

PERSONNEL.

Behold the four drawn up in line
Where erstwhile roamed the lowing kine,
While Kodak fiend, to earn his mutton,
Draws the slide and presses buttton.
Upon the right stands Major Gee,
Sure shot at birds—bar snipe—is he:
(Freckles, couchant at his feet
A veteran and hard to beat.)
Then Colonel Bee, true friend in need,
Attempts to light his neighbor's weed,
(While Boy looks up to hear him say
The word that bids him hie away),
And smiling Alma notes the match
That never had a head to scratch:
(Below reposes steady Cap
Ready to hunt or take a nap.)
Upon the left, a sportsman good,
Is Little John, not Robin Hood
(But over Cash is drawn the veil
Of charity from head to tail).

SPORT.

This stalwart beauty in the stubble,
On ruffed grouse made a clever double,
And Colonel Bee picked from the air
Another ruffed and bouncing pair,
When twelve flushed up by twos and threes,
And flew for refuge to the trees;
Leaving five to tell the tale
Of booming fire and leaden hail.
The Major from the woods below
Emerged too late to see the show:
His disappointment one could trace
Reflected in the Colonel's face,
When deep his martial ire was stirred
By prowling cat that stole his bird.
It was a sight for gods and men
To see the urbane Colonel then
Present to view a broad expanse
Of hunting boots and canvas pants;
On hands and knees with searching eyes,
Retrieve the mutilated prize.
In fallow field where June grass grew,
Cap quickly stopped, Boy onward drew,
Then Cash and Freckles joined the pair
To form a picture striking, rare.
Of scenes afield it was a gem,
A blanket would have covered them!
A forward step, of wings a gleam,
And vanished was an artist's dream.
And so was Cash, when for a race
Mollie Cottontail set the pace.
Of woodcock not a mark was found,
Though beaten was the finest ground:
Their failing numbers year by year
Proclaim a long farewell is near.
In sunny mead and shady wood
The dogs ranged wide and stanchly stood,
While bevies flushed and rushed away
to life or death. So passed the day.
When homeward turned the weary feet
The morning hours saw light and fleet,
The spacious pockets of the four
Bulged out with quail and grouse galore.

L'ENVOI.

Too quickly speed the happy hours
With comrades true in nature's bowers,
Where winds and streams with music rare
Fill sunlit forest aisles! The air
From sighing pine and cedar gloom
Comes laden with a sweet perfume,
And all the elves of earth and sky
Conspire to swell the harmony.
The shadows up the valleys come,
The ruffed grouse sounds the evening drum;
Afar the hamlet lights appear
A shining welcome to good cheer.
From heaven's dome creep one by one
The silent stars: the day is done.

ALMA.

Holumdays in Old Dixie.

When de corn am out de husk,
An' de chickens roost at dusk;
When de 'simmons ripen blue,
An' de ring-dove 'gins to coo;
Den de holumdays hab come,
An' we'll roll de harvest home.
Whoop, niggers! Christmas comin'!
John Coona is in town!

LET others celebrate Christmas as they will, the Yule log burns nowhere more brightly, and nowhere do mirth and festivity find less restraint, even now, than they did years ago among the negro slaves on the old plantation, "away down souf in Dixie." With the colored population, as well as with quality folks, it is a general holiday from the morning before Christmas until the close of the year. All labor, except the necessary labor of the household and farm, is suspended. John Coona, the clown of the tenantry, with his rag-tail retinue, is out in full force, and all draw heavily upon the generosity of the master of the house. "Yes, indeed!" as old Aunt Norah was telling a group of big-eyed children. "Yes, indeed, honeys! I does well remember dem times, and no mistake. Plenty of aignogg up at de great house de huli day long; and how de ole marse did enjoy dem capers! Eberybody out on de front porch a-watching for John Coona and de procession to come up from de quarter, and all a-waiting for de address of welcome from Marse Capehart. Yes, indeed! and Mistis Capehart and Aunt Sue wid handfuls of shiny quarters and dimes to scramble for when de ceremonies done concluded. Well, dem was good times, too, if dey was slave times."

All enjoyed the home frolic; and if any desired, they were permitted to visit their kinsfolk and friends in neighboring States, and often a steamboat was chartered to go up river with a whole load of delighted darkies, or they were whisked away in the rail cars to their destination. At the Christmas-tide, in slave times, the boon of freedom was most frequently solicited or granted. Lines of caste were apt to be overstepped, and the master's family and servants made common joy together. The nicest delicacies were sent from "the great house" to the negro quarter, and Aunt Dinah or Chloe reciprocated by sending back her best corn cake or chicken fixin's in friendly exchange.

Day before Christmas is the great market day of the year in Dixie: a day when the negroes are wont to carry to some neighboring town for sale the products of their leisure or extra hours, the proceeds of which go into their own private purses. At earliest dawn there is an unusual stir in the chicken coops, and dismal shrieks from the pig pens. Big negroes, men and women, and little pickaninnies are running in all directions. Every vehicle, horse and mule on the plantation is impressed into service, and there is "mounting in hot haste," as the war poet sings, and hitching up and packing and toting, and interminable bustle and din, until at last the cavalcade gets under way. Old Sam leads the van with a four-mule Lynchburg wagon, carrying three or four bales of cotton. Then follows a two-horse wagon, filled with poultry and garden truck, with three or four women in gaudy bandannas of red and yellow, seated in the front. Then come two or three urchins on horseback, with packs of coon skins lashed on behind, and a venerable darky on a venerable mule carrying a basket of garden seeds, followed by a spike team, with the driver astride the wheelhorse, loaded with bags of corn, upon which several whooping youngsters sit astride, and in the rear of all a bevy of noisy children of both sexes, with a score of dogs of every breed barking and yelping and darting in and out of the woods in wild excess of the general joy. Never was party more joyous or light-hearted than this motley cavalcade as it winds through the piney woods and under the moss-hung oaks and cypresses which girt the rustic road.

Arrived in town, the produce is sold; there is a general interchange of Christmas greetings and joyful anticipations of frolics to come, a little preliminary merry-making, and sometimes a too free indulgence in corn juice. Little luxuries and articles of finery are bought, and at evening the party returns to their homes with lighter loads and lighter hearts, to prepare for the long anticipated frolic of Christmas Eve, and the poor cracker or freedman, with his single steer harnessed into a make-shift vehicle, seems as happy as those who bear the names of the first families in the county.

At dusk the whole quarter is in an uproar. Huge piles of pitch pine are set ablaze, and roseate lightwood fires are kindled throughout the open air premises. Dusky groups are scattered in all directions, and fantastic shadows flit hither and yon. The deep recesses of the woods resound with laughter, singing and cat-calls. The old stone jug passes freely, and corncob pipes are often replenished. Old Sam brings out his squeaky fiddle and diligently rosins the bow. Cudjo and Dick are on hand with their banjoes, horse bones and goomer boxes. And now the fun begins. Such breakdowns, Juba dances, reels and "Essence of Ole Virginny" have never disturbed the stillness of the night for a year.

Wake snakes! Walk your chalks!
Sally go down the middle.
Hit yo' heels, knock yo' toes,
An' scrape dat cornstalk fiddle.
Ki-ya! Whoopee!

And all night long the banjo picks, the goomers thrum, the dancers dance, and the jug goes round, until the dawn of day brings brief surcease and the tired negroes seek a short repose. Shortly after sunrise the dusky hive is again astir. Some of the house servants assist the mistress in preparing for the great event of the day, the Christmas dinner; and no meager repast is that. What with the gumbo soup, the barbecued sheep, the roast possum, the toothsome poultry, the hot mince pies, and the eggnog, the keenest appetities are sated to repletion. Those of the farm hands who are fond of forest sports form small parties for shooting or fishing, while the devoutly inclined jump into a wagon and drive to a neighboring rustic church. Others pay visits to friends, while the young and boisterous fill up the day with uncouth sports, in bucking, wrestling, climbing greased poles and chasing pigs. At evening all are at home again and the festivities of the previous night are repeated. Often the master's family pay frequent visits, and encourage emulation by small presents of money. Utmost latitude is allowed within the limits of decency, and all through the week the frolic is kept up, varied each day with some new pastime. Great is the havoc among the small game of the woods, the coons, the possums, the rabbits, the squirrels, and the partridges; fearful the mortality among the turkey coops and pig styes, and taxing to the pockets of their patrons the frequent demands for a Christmas gift. The negroes rule for the time until New Year's has come and gone, and then all hands readily resume their wonted labors, somewhat worn but in no wise demoralized by the extraordinary indulgences of the week. On large estates and well-ordered plantations of magnitude, the routine of to-day does not vary much from that of past slave times. During lulls, the hours of evening are often beguiled by song and story, and many an antiquated darky gains distinguished place among his credulous listeners by recounting his hair-breadth escapes from stump bears, his marvelous ghost stories and adventures with spooks and night doctors. Then the spirit of mischief lurks in the gloaming, and many a practical joke is played upon the timorous or superstitious, whose weak points are known. Uncle Ned, a venerable and pious African, was an easy victim. He had outlived his usefulness, but was nevertheless handy at little odd jubs about the premises, and belonged to that class which might be termed necessary nuisances. He did little except to mind his garden patch and his pig-pen, the remainder of his time being spent in prayers, for he was remarkably devout in his declining age, however remiss he might have been in his youth. He had always a sermon or an admonition at his tongue's end, and misquoted Scripture by the yard whenever any one deigned to converse with him. Nevertheless, his weaknesses and shortcomings were well known; his breath and his cabin were often rank with the fumes of corn whisky, while heaps of chicken feathers were often found under his bed, although his own private stock of poultry never seemed to diminish. He had great and unmistakable fears of the Evil One, who, he said, seemed to have a special spite against him, and who, he declared most solemnly, had frequently appeared to him in the form of a cat, a copper snake, an owl and a black crow. Occasionally, when the arch fiend could not impress him in any other way he said he would spit at him from among the live coals in the fireplace.

At length one Christmas time the enemy manifested himself in a most extraordinary manner. It was evening, and the cabin hearth was glowing with a fine bed of coals, upon which rested a coffee-pot and a skillet frizzling with odorous fat sausages. Betty, his old woman, was fidgeting about the supper table, as Uncle Ned sat toasting his shins before the fire, reflecting upon his sins, in joyful anticipation of the feast in preparation. Now, it just so happened that his young master, a scapegrace, who was home from college for the holiday vacation, had taken a note of the situation and stealthily climbed to the roof of the cabin, whence he occasionally dropped a few grains of powder from a horn into the fireplace.

At the first fizz old Ned drew his chair back suddenly.

"What dat? Betty, look dar! See de debble a-sparklin' in de fire?"

"Oh, pshaw! 'taint nuffin, you ole fool—only jes a sign ob snow," and Betty went on with her work.

"Dar it am ag'in! Oh, golly! Betty, 'pears to me I smell brimstone!"

"Go 'long. 'Tain't nuffin', I tell you," said Betty, but with less assurance than before.

Just then an extra dose fizzled on the coals, and the smoke of the miniature explosion drove the old couple to the further corner of the room, where Ned began to quake fearfully and attempt a prayer. At the same moment the young mischief at the top of the chimney, in the effort to suppress his mirth, accidently dropped the powder horn plump into the fire. Much alarmed, he did not wait to witness the effects, but slid from the roof in a jiffy, and ran to the house as fast as his legs could carry him. In less than a minute afterward there was a rush and a shuffle of hurrying footsteps through the yard, and through the porch to the front door; the door burst open, and in rushed Uncle Ned, staring and speechless, while Aunt Betty followed close behind in a delirium of terror.

"Oh, marster! Oh mistis!" cried she, "de debil is arter us, sure enough."

"What's the matter now, Aunt Betty?" they said, with some concern at her visible emotion.

"Oh, de debil he come down de chimbly wid a clap of thunder and de fiery cloud, and shy de coffee-pot plum at my head, and he fling de skillet of sausage at de ole man, an' he toss de chunks and coals all ober de room wid de shovel. Oh, golly! Lor' sakes! Such a smell ob brimstone, and such a cloud ob smoke! An' den he sputter and spit like a ole black cat, an' finally he jump on de chist and sit dar wid hees legs crossed and blowing off streams of fire. Oh, mistis, de debil hab us dis time sure!"

At these words poor old Ned sunk at the feet of his mistress and grasped her gown with quaking hands, while all the negroes who had gathered around by this time shook with dismay. Some words of comfort were offered, but Betty grew incoherent, and would only say that she "left de debil sitting on the chist—de berry chist whar dat whisky was. Didn't I tole you, ole man, offen 'nuff 'bout dat whisky? Debil knowed well enough dat whisky hab no bizness dar," and Betty sobbed aloud.

The master at one time thought the old couple were drunk, but when he saw that their terror was real he made his way to the cabin, followed by a whole bevy of negroes, who kept at a respectful distance, and sure enough he found the condition of things pretty much as had been described. Everything was in fearful confusion, and a cloud of sulphurous smoke still filled the room. The master looked bewildered, and the teeth of the negroes began to chatter at these unmistakable evidences of the presence of his Satanic Majesty.

Presently Ned stooped to examine something upon the floor, but suddenly drew back with a shriek. "Oh, Lord! Oh, Lord!" said he; "it's one of his horns!"

"Let me see it," demanded the master. Hand it to me!"

"Oh, Lord! marster; tell me to go kill myself; tell me to drink pizen, but nebber ask me to touch dat horn. I couldn't do it nohow—not for de world to come."

The master accordingly picked it up himself, and examined it. Then the secret was solved at once. The horn was his own, and he had loaned it to his son that morning to go shooting with.

"I smell brimstone powerful," said Ned, as he glanced at the terrible relic.

"And I smell a rat," said the master.

Soon afterward the old negro was fully informed as to all the details of his misadventure, but his incredulous mind could never divest itself of the belief that the devil had some agency in the matter.

CHARLES HALLOCK.

Natural History.

Potomac Notes.

The Zoo Park.

THE harpy eagle is proving attractive. It is now in fine condition, and its plumage is perfect. Three New York artists have recently sketched the bird, and are loud in its praises.

The seven young pumas are now about seven months old and are in good condition. This is true also of the four five-month-old lions, and of the four or five young elk. Seven adult antelope (five three-year-old bulls and two cows) and two calves and five mule deer have recently been added to the collection from the Yellowstone Park. A pair of moose from Ontario has also been added. They are very tame and in excellent condition. Another addition is a pair of wild boars.

The Semidi Propagating Company, through Mr. Byron Andrews, of Washington, has placed a dozen arctic or blue foxes in the park. These are being closely observed to learn their breeding habits, so as to be able to deal intelligently with them in their far-away Alaskan homes.

One of the most interesting families in the National Park is the boa with her young, sixty-two of which were born about the first of December. The boas at birth were about 18 inches long, and twenty-four hours after birth killed mice, which, however, they did not eat. The mother was a gift from the Governor of the State of Para, and has been in Washington about four months. A number of the young have been sent to the Philadelphia and New York zoos.

Mr. Baker informs us that there is a steady increase of visitors, the most noticeable increase being in the number of week-day visitors. People now visit the park in all sorts of weather. The park as an aid in the educating of children plays a prominent part. Thousands of school children visit the park annually and gain a knowledge of our animal life that would be impossible to learn from books alone.

B. A. BEAN.

A Pine Grosbeak at Sea.

THE Gloucester (Mass.) Times of Dec. 14 reports: "A strange bird flew on board the schooner Procyon during a snow storm Wednesday on Cashes. The little fellow was nearly exhausted, but was cared for by the crew, and soon became very chipper and tame. It is about the size of a robbin, with brown head, blue wings, dark gray breast, and has a bill like a parrot's. The crew had never seen a bird like it before, and have named it a Cape Island parrot." The bird was probably a pine grosbeak.

An Inhuman Trust.

Florida Times-Union, Dec. 11.

No greater evil threatens the American people to-day than that which will certainly follow the extermination of our birds; but few appreciate the wholesale manner in which war is made upon them. To open the eyes of our people to the proportions of the massacre and the necessity of taking some such steps as are earnestly recommended by those popularly styled "feather cranks," we copy the following statement from the FOREST AND STREAM of Dec. 2:

Reference was recently made in the FOREST AND STREAM to a party of bird skinners which had left Long Island, sent out by a factory there, to visit Florida and other waters, and to get a cargo of plume birds. The vessel is to be absent all winter, all sorts of birds are to be killed, and at frequent intervals shipments of skins are to be made to New York.

On Nov. 22 the factory occupied by the concern which sent out this boat load of bird skinners was destroyed by fire, and its whole contents, including many thousand bird skins, were burned up. It is said that in the factory there were 10,000 sea gulls, 20,000 wings of various birds, and 10,000 heads of birds. The factory was a building 100 by 50 feet, one story high, and employed fifty hands; and we are told that the concern had gunners shooting for it all along the Long Island coast, as well as in Massachusetts, on the islands off the coast of Maine, and at various points along the shores of the Southern States. This record for numbers killed by any one man employed by the factory is said to have been 141,000 birds killed in a single season in Florida.

During the last year the demand for feathers has been practically limited to the long so-called eagle feathers, which are taken from eagles, hawks, herons, swans, geese, turkeys and turkey buzzards, and to the long wings of gulls and some other sea fowl. It is hoped, however, by the manufacturers that the coming season will show a more general demand for birds of all descriptions.

In sending us the clipping, Dr. DeWitt Webb, Vice-President of the St. Augustine branch of the Humane Society, begs us to urge upon all sheriffs the duty of protecting our birds from these murderers. This is a labor of love often performed by this paper, and we cite again the law to remind the sheriffs that they have sworn to enforce it:

Be it enacted by the Legislature of the State of Florida:

Section 1. That hereafter it shall be unlawful for any person to kill in this State for the purpose of sale or commercial traffic any of the following named plumed birds. That is, any crane, egret, ibis, curlew or heron.

Sec. 2. That hereafter it shall be unlawful for any person to purchase, trade or traffic in any of the plumed birds hereinbefore mentioned, or for commercial purposes to purchase, trade or traffic in the plumes or peltry of the said plumed birds of the State.

Sec. 3. That whoever shall violate any of the provisions of this act shall be guilty of a misdemeanor, and upon conviction thereof shall be fined in a sum not exceeding $300, or imprisoned in the county jail not exceeding six months, at the discretion of the court.

Approved June 5, 1891.

Game Bag and Gun.

In Maine Woods.

BOSTON, Dec. 15.—About the best showing of deer brought from Maine during the open season in that State, which closes to-day, was that of Messrs. Geo. P. Wasson and A. H. Morse, Jr. They came out from Randal's camps, White Cap Mountain, the other day, bringing four buck deer. One of the bucks was very curiously marked; about half albino. The lower back half of the body, as well as hind legs, was nearly white, being only slightly dappled or spotted with brown. The forelegs and upper front half of the body was more or less red or brown, mixed with white. It was a buck of some age, as there were five good points to the antlers. Mr. Morse, who shot this deer, will have the head mounted and a rug made of the curious skin. It almost seems as though the Boston Sportsmen's Show should secure the skin entire, and have it mounted as a freak in color. Another odd feature concerning the deer taken by these two gentlemen was the fact that the horns almost immediately came off each one of three of them; conclusive evidence that deer in Maine shed their antlers quite early in December to later in that month. The horns of each were saved, however, so that the heads—really fine ones—can be mounted.

The papers say that Charles F. Towne, a Colby student, after hunting all day in the vicinity of Rum Mountain, near Wilson Lake, Piscataquis county, at nightfall found that he had lost his bearings. He took out his compass to get the direction, but found that the needle adhered to the glass and would not move. A drop of water had got in through the case and held the needle fast. Realizing that he was lost, he bethought himself that it would be useless to strike off through the timber, and that he would freeze if he stopped walking. Kindle a fire he could not. Selecting two large trees he commenced to walk back and forth between them. His clothes soon became frozen from moisture during the day. He kept up his weary march all night long. He had had no food since morning, but being in the best of physical condition, from playing football, he withstood the strain. At daylight, or sunrise, he struck due east and soon came out to a tote road. Following this he came to a camp where he obtained rest and food, with the direction to Elliottville. Here he took the train back to camp, where he had left his fellow hunters. They had been searching for him, having gone entirely around Wilson Lake. The same thing happened to a compass taken into the woods by Dr. Lambert, at Bemis, a year ago. The great Thanksgiving snow storm came up, and late in the afternoon Dr. Lambert found himself three or four miles into the woods from the lake or camps. His compass would not work. Water had got into it, and capillary attraction had stuck the needle fast to the glass. The snow was blinding, but he knew that down hill would lead to water, and that water ran toward the lake. He started down hill, and soon after dark he came to a brook. This he could follow, and he followed it down. He strongly hoped that it was Toothaker Brook, which he had crossed in the morning. This it proved to be, and he soon came to a lumber road that he followed down to camp. He has disposed of that compass and now has one the cases of which are water tight.

Another curious case of a hunter or guide lost in the woods is reported from Kineo, Moosehead Lake. Two brothers went out after moose and became separated. At dusk one of them shot the moose he had been following. He soon realized that it would be useless to try to get out of the woods that night. He took the hide off

the moose while the body was warm. He conceived the idea of wrapping himself in the hide to keep warm, the night being very cold. With the hair side in he rolled himself up in the hide, and soon fell asleep. In the morning he tried to move, but found that the hide had frozen stiff and hard. By no means could he extricate himself. Neither could he stand up nor walk. Here was a predicament. He did not give up to die, however. He well knew that his brother would be out after him at daylight, and would have little difficulty in tracking him to his place of imprisonment. In this he was right. By noon his brother had found him, much stiffened and uncomfortable from his cramped position in the frozen moose hide. The brother could not help laughing at the sight that met him, and at first proposed rolling "the whole business" into camp. But the man in the moose hide decided that a fire be built and that he be thawed out. This was done, and both think the escape a narrow one.

BOSTON, Dec. 18.—The Maine big-game season, which was fully closed Friday night, shows an increase in the number of deer shipped through Bangor by rail. The total number recorded there was 3,415, an increase of 38 over last year. It is also mentioned that some more deer are yet to be transported, under special permit, and that this will make a still greater showing for the season just passed, although it is sixteen days shorter than last year. The total number of moose transported through Bangor for the season to date has been 138, while last year's completed shipments were 202. Doubtless there are still a few heads yet to be transported, under special license, the moose having been killed in open season, and this is expected to bring the season more nearly up to that of a year ago. Recent reports from guides and woodsmen suggest that there are more young moose and cows in the woods than ever before, but that bulls with good heads are scarce.

W. T. Farley, of Boston, and Dr. G. A. McAleer, of Worcester, are just out of the New Brunswick woods, the Doctor with a fine moose and Mr. Farley with a big caribou. This is Mr. Farley's third caribou, though his hopes were great of getting a moose this year. A good account of their trip is coming for the FOREST AND STREAM. Mr. and Mrs. F. H. Talcott, of Dorchester, have returned from an extended shooting trip in the Allegash region, Me. Both shot a fine deer or two, but neither got a moose. Mrs. Talcott shoots her own game, without male assistance.

Sportsmen who fish the Rangeley Lakes will be pleased to learn of the engagement of Mr. N. G. Manson, of Camp Leatherstocking, Richardson Lake. He is to be married on Wednesday of this week to Miss Olive Hooper Lunt, of New York. The couple propose to spend most of the summer of 1900 at Camp Leatherstocking.

Boston markets have now more deer on sale than a few weeks ago, but not nearly as many as a year ago. There is decidedly less of illegal shipping here, but still returning sportsmen continue to send their deer by express right into market, where they are sold. This speaks more of market-hunting than of real sportsmanship, but still hunters of moderate means or economical turn persist that a hunting trip to Maine or the Provinces costs a good deal, and that if the money received for a deer or two helps out, it is nobody's business. I saw a big load the other day backed up to a commission house. Soon I noticed that there was one bull elk among the lot, and next that the deer were rather small, with diminutive antlers. Later I learned that the whole load was from the Morton reservation or preserve in Vermont. The sixteen deer and one elk had been killed and sent to market. Further particulars are not obtainable here. SPECIAL.

CHICAGO AND THE WEST.

Storms in the West.

CHICAGO, Ill., Dec. 15.—Chicago for the last two days has been treated to the first snow storm of the season. Thus far the weather has not been very cold, nor has the snow fallen to any considerable depth, the storm having been but a mild one and the weather pleasant rather than otherwise. This snowfall has extended well below the central part of this State and Indiana, but is not considered severe enough to be dangerous for the quail. The snow lies but a few inches deep here.

Further to the north there have been very severe storms this week. At Eau Claire and Chippewa Falls, Wis., on Wednesday, a very violent storm prevailed, with heavy wind, which drifted the snow in such way that both wagon roads and railroads were blocked. This same storm was exceedingly severe across Minnesota, the snow drifting to a depth of 15 feet in places, and some of the cities looked as though they had been under a blizzard for days. The storm, in fact, lasted for sixty hours, and has practically tied up the section over which it passed. It need hardly be said that this storm will be very injurious to the quail crop, excepting in sections where the cover is very dense.

Quail and a Church.

I was talking this week with Mr. Thomas R. Laflin, of Milan, Ill., one of our best known shooters in this section, and he tells me that he has been having great sport this fall with the quail, which are very abundant in his part of the country, which is near Rock Island. Mr. Laflin tells me a peculiar quail story, which, on its face, seems so impossible, and which yet has in it so many elements of probability, that it deserves publication. He says that a man of his town by name of Miller is the original teller of the story, the facts of which happened to Mr. Miller. The latter was driving along the highway this fall with a member of his family, when some quail were seen running along a hedge, which hedge passed close to a church, the church being but a short distance from the spot at which the quail were seen. Miller descended from his wagon and fired at the running quail, killing one of them. At the report of his gun another flock rose a little way ahead of him, and started off, closely bunched together. They flew square into the white painted side of the church, striking it as though they would tear off the weather boarding. Miller picked up nine of the quail dead. He said that he did not expect any one to believe the story, but that it was really true.

Mr. Laflin told me that once when he and his brother were boys they were at work in the barn during a time when there was a heavy storm of snow and wind. They were startled by hearing a great noise on the side of the barn, as though it were struck by a number of heavy bodies. They went outside and found that a flock of prairie chickens had flow squarely into the barn, no doubt while blinded by the storm. Apparently the whole flock struck the barn, and thirteen were killed.

I presume every one has seen prairie chickens killed by flying against the telegraph wires, at least every one who has lived in the West in earlier times. I once picked up two chickens which I saw killed in this way by flying against the wire. It was quite common for the section hands on the railroad to bring in numbers of chickens which had killed themselves in this way. This was in Iowa, previous to 1880.

One could understand that birds would fly against an almost invisible wire. Yet I have seen two quail killed by flying into the side of a barn on my father's place when I was a boy. I recall also that one time some of us youngsters trapped several quail, which we kept alive in the hay mow. When frightened by our coming into the mow these birds would get up and fly at full speed apparently in any direction that chanced, and eventually they all killed themselves in this way, except one, which managed to hit the hole left by a broken pane of glass in the hay mow window, and so escaped. The broken window had been there all the time, but they did not seem to know it.

Mr. Laflin does not vouch for the truth of his quail story, except to tell it as it was told to him. I may add that he is an old-time Western man and something of a hunter. Twenty-one years ago he spent an entire summer in the mountains in what is now the Blackfoot reservation, there being only three in the party. That was a rather wilder country then than it is to-day.

Alaska Explorations.

Mr. Harry W. Lee, of this city, is the author of the very spirited story of hunting adventure in Alaska which appeared in the FOREST AND STREAM early this year. Mr. Lee left Chicago on May 1 for another trip to Alaska, from which he returned last October. He met the Herriman expedition at Dutch Harbor. This time Mr. Lee did not go after big game, but devoted most of his time to collecting specimens of the bird life of Alaska. He met with great success, and his collection is highly valuable.

Death of T. Benton Leiter.

Mr. T. Benton Leiter, nephew of Levi Z. Leiter, of Chicago, died on Dec. 11, at Mt. Hope, Md., where he had been in a moribund condition for some time. He was only thirty-five years of age, but he had crowded a great deal of activity into his short life. He was long prominent among the sportsmen of Chicago, a splendid, hearty young fellow, and an esteemed member of Maksawba Club. It was he who practically bought out the shares of the Maksawba Club, placing the club holding of 5,000 acres practically in the control of Levi Z. Leiter, who has intended to drain the marsh lands and make them fit for farming purposes. Later Mr. Leiter went to Sheridan, Wyo., as manager of a wealthy gold mining property. He lost his fortune and his health, and of late has furnished a good example of the rapidity with which a man is forgotten by his friends when ill fortune assails him.

Bound for Rockport.

Mr. H. H. Hawthorn, with his friends, Messrs. H. E. Carroll, F. Channing and J. Slaker, all of this city, propose to take their wives and go somewhere South this winter, probably starting toward the close of January and remaining six weeks. Mr. Hawthorn came to me to learn something about Rockport, Texas, and is so much pleased with what I am able to tell him about that country that he will take his party there. They certainly should have a most enjoyable time.

For Didymus.

For the benefit of friend Didymus, I should like to hang up a few more big bags of Western game, just to shake them before his eyes as it were, and make him plenty mad. To-day I was talking with Jesse Pumphrey, of Columbus, O., and he told me that he had just finished shooting quail for a couple of weeks in Fairfield county, O., with his friend, Dr. R. B. Miller, now of Chicago, but formerly of Amelia, O. Mr. Pumphrey said that they did not have such very good luck, as they only killed 600 quail in two weeks. He said that they had much better luck last year, and during their hunt killed 849. He says that Dr. Miller is a very good quail shot. This is the same Dr. Miller who, with Dr. Carson, of this city, killed 109 quail in one day at Neoga, Ill., this fall, over 300 on the same hunt. These be the facts.

Traveling.

Mr. Edward H. Ford, manager of the Economic Smokeless Powder Company, whose works are at Hammond, Ind., leaves some time in January for a brief visit to England, which was his native country, and where his family has preceded him by a few weeks. Mr. Ford is an able and conscientious business man, and I may add the best of company, for I spent a very pleasant day with him not long since, on my first visit to a powder mill.

Mr. C. J. Boor, of this city, starts to-night for southern Illinois for a week's shooting on quail.

Season Closing.

The quail season closes in Illinois next Wednesday. I do not learn of many Chicago shooters who have been out after quail this week, but a good many will go out to shoot the last day or so of the season. As has been so often stated earlier in these columns, the quail season of 1899 has been phenomenally good in this section. All indications seem to point to an abundant crop of birds next year also, as a good head of game is carried over. Granted a decent winter and not too wet a spring, we shall see plenty of quail next fall.

Still Hunt.

Col. C. E. Felton and Mr. W. P. Mussey shot quail this week at Mattoon, Ill., guests of Dr. Ferguson and Mr. Voss; but had rather a slim hunt, bagging only twenty-four birds in two days. My friend Col. Fenton succeeded in killing four birds in his two days, which I conceive to be conclusive proof of his skill with the shotgun. My challenge to Col. Felton for a quail race is at once hurled defiantly into the arena of his front yard.

E. HOUGH.

480 CAXTON BUILDING, Chicago, Ill.

Quail in Michigan.

HARTFORD, Mich., Dec. 2.—*Editor Forest and Stream:* The quail season has come and gone. In Van Buren county the birds were fairly plenty, plump and fat, having lived upon the uncut wheat stubbles where grain was plenty. The opening of the season found me nearly "hors du combat" with a sore thumb, but, nothing daunted, I took the trusty Parker and the stanch setter, Frankie, and sallied forth. Before I had gotten out of sight of the beautiful vilage, Frankie told me by the language that everp sportsman understands, that quail were close at hand. Soon after giving a few high-heading swiffs, she made a few careful moves forward, and became as rigid as a statute—the first point of the season. How I wished for a camera at that moment that I might have sent to the FOREST AND STREAM the beauty of that point! I stepped briskly forward and got in line with the dog, when "whirred" into the air eighteen or twenty quail from not over two rods distant. Picking out the best I rounded the fairest birds; the report of right and left sounded instantaneously, and I missed with the first and killed with the second—sore thumb badly hurt.

Picking up the first bird and putting it into my hunting coat, I went toward the spot where I had marked the birds down. I had gone but half the distance I thought they had flown, when Frankie, who was well in advance, came to a sudden stop. Stepping forward and expecting to get a splendid rise of a single bird, and not seeing any, though the dog was still stanch, I stepped forward again, but still there was no rise. I then turned back toward the dog and within 3 feet of its nose was a bird too badly crippled to rise. I claimed it the victim of the first barrel.

Again I went forward to where we had marked down the bunch, and when near the spot my faithful friend came to another point. Advancing quickly abreast of the dog and a few feet to the right, out from under my very feet went a strong, swift bird toward cover a short distance away. A quick aim and sharp report, and another beauty was rolling in the stubble. Looking back and seeing the dog still at a point, I stepped in front of her, and out went another bird from under my feet, and from this mark down in the corner of the field I secured seven birds. Seeing that it was nearly noon, and that I must be home to dinner, I started homeward, and en route picked up two more quail and one woodcock, and felt perfectly satisfied with the short trip and the ten birds secured without going out of sight of the village.

On Nov. 30 I again put in the day with dog and gun, and found plenty of the birds left, some whole coveys not having been molested, showing that with a fair winter we will have plenty of birds for next season.

During the season I have bagged about eighty quail and four partridges and several woodcocks, and not one break nor "mouthed" bird by my faithful setter.

S. COOK.

A California Decision.

THE written opinion of the Supreme Court filed in the Knapp habeas corpus case sustains the position taken by the Chronicle in every particular. Knapp had been convicted in Stanislaus county of violating an ordinance prohibiting the shipment of game elsewhere for sale. It was held by the lower courts that a county had the right to restrict game killing and shipment for sale as a police regulation, from which Knapp appealed. After hearing argument he was promptly discharged by the Supreme Court, the filing of an opinion being reserved for a later date. "Having taken the game lawfully and at a time when it is lawful for any one to shoot ducks the ordinance prohibiting their shipment," says the Court, "is an unreasonable interference with the right of private property and an unnecessary restraint of trade." In a concurring opinion Chief Justice Beatty makes the point still clearer: "A county ordinance forbidding all persons under penalty to transport game lawfully taken to the place where they desire to use or dispose of it is violative of the right of private property as defined and regulated by general law and necessarily invalid." That seems to be definite enough to convince any one that a county has not the right to frame a local law under the pretense of a police regulation which shall interfere with the right of a market-hunter to kill wild game and sell it wherever he chooses, so long as the killing is done within the requirements of general law. Twenty-one counties adopted the void ordinance.

The general game law provides for closed and open seasons for the killing and sale of game, and it restricts the maximum bore of the weapons to be used in the slaughter of wild water fowl and small game to a No. 10 gauge; but one of the sections of the statute does the extraordinary thing of empowering the various county boards of supervisors to amend itself by shortening the statutory time in which game can be taken within the county boundaries. Unfortunately, the Supreme Court found it unnecessary for the purposes of the Knapp case to decide that question. It was content to say: "If such further restrictions upon the right to kill game may be made by county boards, such regulations must be reasonable, not oppressive, to any class, and must not contravene any established policy of the State." But the Court comes dangerously near settling the point in another part of the decision when it says: "The statutes of the State in regard to game prohibit the offering for sale of game during the time it is unlawful to kill such game. The State regulations upon this particular subject seem complete and restrict the rights of citizens so far as was necessary to prevent the unlawful killing of game."

Inferentially, the decision denies the right of county boards of supervisors to alter the statutory limitations of the game seasons, presumably because that would be

delegating State legislative powers to such bodies and enable them to convert a general statute into an unconstitutional special local law, whose terms would be at variance with the policy of the statute.—San Francisco Chronicle, Dec. 7.

The Wild Turkey's Sharp Eye.

Bledsoe County, Tenn.—After trudging all day along the top of the mountain with no success at all, inasmuch as I had shot several times, but failed to bring down my game, I ran across an old hunter, J. W. Hyde. After the usual greeting we seated ourselves on an old log to exchange notes. I put the question: "Why are the turkeys always on the run when I see them?" The old man spit through his teeth, changed his position, laid his long muzzleloading rifle on the ground, put the fourth portion of a plug of tobacco in his mouth and proceeded to tell me why the turkeys were always on the run when I saw them: "Of all the game I have ever hunted, turkeys display the most wonderful power of vision. I cannot tell just why this is. I have made a microscopical examination of the eyes of the hawk, eagle, fox, weasel and owl, but find no material difference in the lens and retina; the ciliary muscles and the iris are exactly the same; yet none of these keen vision creatures can compare with the turkey in point of seeing. I remember the acuteness of sight displayed by an old gobbler in the spring of 1892. I had carefully concealed myself, and no part of my body was visible but the upper portion of my head. A puff of wind slightly disturbed the brim of my hat; he saw it and immediately took to flight.

"On another occasion I was hunting in the mountains in Georgia. I was lying behind a log and was carefully hidden, all but the upper part of my face. A turkey was slowly coming in response to my call, and was carefully noticing for signs of danger. A mosquito was stinging me fearfully on the forehead; I raised my finger slowly to crush it, and as soon as the finger came within the range of vision, cluck went the turkey, and he was gone.

"Now the most inexplicable thing in regard to hunting turkeys is that with all his acuteness of sight the surest way to get shot is to sit down in an open place with your back against a tree in full view, and strange to say, he will walk up within ten steps without seeing you." Just then we noticed that the sun was down; the old hunter invited me to spend the night at his camp, which I did, and had a most pleasant time.

J. W. Drane.

Concerning Big Bags.

Editor Forest and Stream:

Please present the compliments of Didymus to Mr. Hough, which the same confesses with shame and confusion of face that he was guilty of a little slaughtering in his youthful days, but those days were not as these days, for the multitude of victims for the sportsman was so great that no one considered it possible that their ranks could ever be thinned, and no one ever dreamed of being censured for a crowded bag; but now, as the amount of game of all kinds throughout the country is getting "small by degrees and beautifully less," it behooves all thinking and considerate sportsmen to put a little check upon their love of sport, and to kill a market-shooter whenever they can do it accidentally. If this is not done, I'm afraid posterity folks will swear at us.

Mr. Hough asks whether Didymus is a "good, clean shot." Well, he thinks he was, but four score years has tamed his enthusiasm and made him rather shaky, though only a few days ago he shot a few snipe and quail. A great many years ago he was wicked enough to try his hands at trapshooting, and killed eighteen out of twenty double birds, at Cincinnati, but they were wild pigeons; still it passed as proof that he was a "good, clean shot." He has always had that reputation, and some of his best bags have been made close by the ground on which Mr. Hough's office stands. It was about the time that plans were being laid for his creation! Game was plenty then, for clubs were not then born to interfere with it. About that time he paid a visit to the new-born town of Madison, Wis., and found that part of the country swarming with prairie grouse. They were so destructive that some of the farmers begged him, as a great favor, to do some slaughtering for them, and he did; and now behold the poor Chicagoites consider it a streak of luck if they can kill a dozen on a trip of fifty or a hundred miles. Shooting them was no sport for Didymus, and he would leave them at once if he met with quail or snipe. All of which is respectfully submitted by Didymus.

St. Augustine, Fla., Dec. 11.

Maryland Notes.

There are very few partridges (Bob White), except in the lower part of Maryland, this year. Of the 150 dozen birds turned out last year only five birds were lost in shipping. They were carried in little crates, arranged in tiers, nine males and nine females in each compartment. An effort will be made to have a close season next year so as to give the quail a fair chance to recover.

There are still a few grouse in the hilly and mountainous part of the State.

Ducks have been fairly plentiful, especially on the Susquehanna Flats, but they have been very wild and shy, so that the bags have not been very heavy as a rule. This is especially true of redheads and blackheads; the canvasbacks are not so easily scared. As a result of the mild weather, the teal have stayed with us very late—the latest on record. Last Saturday we noticed for the first time this fall little tree sparrows, which usually come this far south in October. Quite a number of guillemot are flying this year; there was quite a flight of these birds in 1896.

Reports from the Potomac are to the effect that few ducks are seen.

Mr. F. C. Kirkwood, Secretary of the Maryland Fish and Game Association, with whom we have conversed concerning game affairs in his State, says that an effort will be made to have the Legislature take up the fish bill, which was introduced two years ago but not acted upon.

B. A. Bean.

Washington, D. C., Dec. 16.

An Ostrich Trust.

The owners of the Florida ostrich farm have, within the last forty-eight hours, completed their arrangements by which they have become the owners of practically all the ostriches in the United States, and they now control the domestic output of ostrich feathers in this country. These arrangements were completed on Saturday evening by the formal acceptance by telegraph of their offer for the birds and plant of the Arizona Ostrich Company, located at Phœnix, in that State. Their purchase of the birds at Fullerton, Cal., was recorded in these columns several weeks ago, and the shipment of thirty birds, received ten days ago, was the first from the new possessions.

The company now owns 600 ostriches, all that are in this country, with the exception of a few at the South Pasadena farms and the dozen or less that are contained in the traveling circuses and zoological gardens of the large cities. The birds at the South Pasadena farm are the property of Cawston & Cockburn, and by agreement these will be kept only for exhibition purposes, all the increase of the flock coming to the Florida company. The investment of the Florida company is fully $300,000, all of which is paid up.—Jacksonville, Fla., Times-Union, Dec. 4.

Currituck Ducking.

Currituck, N. C., Dec. 14.—*Editor Forest and Stream:* Duck shooting at Currituck so far has been much below the average, owing, I think, principally to the beautiful summer-like weather. We still hope to have good sport when the winter weather comes, for we have good reason to believe that an abundant crop of ducks was raised. Several yachting parties coming down the Chesapeake on their way to Florida say that they never saw them more plentiful. Wild geese were never more numerous than now. Swans are also here in great quantities; and I have it from reliable sources that black brant are more plentiful down around New Inlet and Hatteras than they have been for many years. This leads us to hope that the ducks are only a little behind and will still come. The most ducks killed at Currituck this season have been ruddy ducks, and they were never in better condition. Canvasbacks have only begun to arrive, and they are also in splendid condition. Quail shooting has been quite up to the average in this section, and many nice bags have been made.

More Anon.

To Dry Rubber Boots—A Wrinkle Worth Knowing.

I was more than interested in the article published in your issue of Nov. 25, under the above heading and signed D. Now I would suggest to our friend D. that instead of an old bit of flannel to stuff in his boots when they are wet, if he or any other fellow sportsman will simply take an old newspaper and tearing it in several pieces, crumple up and stuff in his boots from the toe up and let them stand over night he will find them absolutely dry in the morning, the paper having absorbed all the moisture.

I have tried this method and know whereof I speak, and am sure if D. will try it the next time he wants to dry his boots he will agree with me that newspaper is far superior for the purpose to flannel.

E. B. K.

Two Deer at One Shot.

The most remarkable shooting story told by the Dead River guides is that about E. G. Ward. He was here early this week. The first day out he secured a small doe. Several days passed without success on his part, but the day before he started for home he saw a doe break through the underbrush and run. He watched a clearing a short distance further on, and when the doe leaped into that he fired. The doe dropped dead, and when he went to secure her he found that the bullet had passed completely through her and had struck a fawn by her side, which he had not seen. The fawn was badly injured, and, the guides say, Mr. Ward was obliged to kill it. He then found himself with three deer on his hands, one more than the law allows.—Bingham (Me.) Correspondence Boston Herald.

"Concerning an Epithet."

From the Prince Edward Island Magazine.

That excellent sportsmen's paper, Forest and Stream, originated a name the propriety of using which was widely discussed in its columns. It is a slangy compound, but very expressive—"game hog"! It is applied to the people who kill game out of season; those who net trout; those who are not satisfied with a full basket, but must needs go on fishing till they have so many fish that they are wasted. Very properly the "game hog" is held up to contempt and his methods are condemned. We notice evidence of the existence of the creature in this Province, and are requested to say that a vigilance committee is on the lookout for "game hogs" who are breaking the laws.

Camp-Fire Flickerings.

"That reminds me."

He Was Somewhat of a Shot Himself.

Around the office stove the boys were swapping lies about the remarkable shooting they had performed or heard of. Pat, the hostler, chipped in with the remark: "I am somewhat of a shot myself, and there's a man living down in Skohegan now who will bear witness to what I'm going to tell you. I was standing talking in front of this man's store door with me rifle on me arm, when a felley we knew come along and he was a-grumbling that the domb cobbler had half-soled and heeled his boots, and had made the heels too dombed high. 'Never mind,' says I, 'I'll fix them for you.' And as that man moved away I raised me rifle to me eye and I took a lift off each heel as he was walking along."

Beaver Kill.

Sea and River Fishing.

ANGLING NOTES.

Petrified Trout Eggs.

Long ago I ceased to be surprised at anything strange which came to my ears or eyes concerning fish. No matter how improbable the story might seem to me, experience had taught me not to contradict it, for very strange things do really happen in the fish world, and it is not always safe to contradict a story that on its face seems to the hearer utterly impossible. Not long ago I heard a story that almost caused me to break the rule and say, "I do not believe it," but it would have been manifestly impolite to do this when the gentleman told me he knew it to be true. He called upon me with a box containing what looked as if they might be dried and shriveled fish eggs, and they also looked as if they might be something else. The story which went with the contents of the box was this: A young woman, Miss Seaver, fishing in Lake Titus in the autumn, caught a female trout, *fontinalis,* and put it in a spring near the shore of the lake; the trout spawned in the spring, and there were plenty of witnesses to the operation, and the eggs not being fertilized, some peculiar chemical properties of the water petrified the eggs. "Had I ever heard of such a petrifaction?" "No." "Did it seem possible that trout eggs would harden in this way in water?" "No." Would I take the box and contents and send them to be examined?" "Yes." I did send the contents of the box to Dr. Evermann, Ichthyologist of the U. S. Fish Commission, and he has just replied as follows:

"I returned from Lake Maxinkuckee, Indiana, at the end of October and have only now had an opportunity to examine the so-called petrified trout eggs which you were kind enough to send me some weeks ago.

"Upon cracking one of them it was at once apparent that they were the seed of some plant, so I took them over to the Agricultural Department and submitted them to the man in charge of rare seed investigations. He pronounced them to be the seed of a species of *Potamogeton,* a genus of the pond weed family, and commonly known as pond weeds, but he says it is impossible to tell which species. The nut which I cracked was still fresh enough to eat. It would be interesting to learn whether *Potamogetons* are common in the waters from which their seeds come."

I said I would make the result known in Forest and Stream when Dr. Evermann replied, although I could not hold out any hope that water, whatever its chemical properties, would petrify trout eggs. I had written this note from memory, when I hunted up this memorandum made when the so-called petrified eggs were given to me. My caller was Chas. B. Howe, of Sandy Hill, N. Y. The spring had a temperature of 45 degrees, and considerable petrified wood has been found in the spring. The trout spawned in the spring four years ago.

Mr. Mansfield's Fly-Casting Record.

For a number of years I have compiled annually the fly and bait casting records in this country and Great Britain, and in giving the record of Mr. Walter D. Mansfield, of San Francisco, I have put him in the expert class instead of under the head of amateur. Mr. Mansfield writes me on the subject and I make the following extract from his letter:

"While I do not understand the word 'expert' as applied to fly-casting, or the difference between an expert and an amateur record in such event, I am in no sense a professional, and have entered the sport purely as an amateur, and with no other object than the pleasure it affords in its companionship with fellow sportsmen, having only in view improvement in the art of fly-casting; hence, if the word 'expert' presupposes professionalism, I am in the amateur class; as a matter of fact, however, I see no reason for classifying fly-casting records.

"My record of 1899, to wit, 133 feet, was made at Stow Lake, Golden Gate Park, July 30. It was noted in Forest and Stream, and has probably already met your attention."

It putting Mr. Mansfield in the expert class, I but followed the practice of the National Rod and Reel Association at the tournaments formerly held at Harlem Mere in Central Park. The rules varied somewhat from time to time, but in the main, winners of first prize in an amateur class were thereafter eligible only in the expert class. At one time winners of first and second prizes in an amateur class had to move up to the expert class, and there was nothing in the conditions of the expert class to imply professionalism. In 1883 the amateur classes were open to those "who had never fished for a living; never been a guide; never engaged in either the manufacture or sale of fishing tackle, and had never taken a first prize in any tournament."

At the tournaments of the Sportsmen's Association held in Madison Square Garden, amateurs were those who had never cast over 65 feet in a contest with 5¾-ounce rods; and 70 feet was the limit in the black bass contests, with no restrictions as to weight of rod. In looking over the score books I find in the expert classes such names as Peter Cooper Hewitt and his brother, Edward R. Hewitt; Warren N. Goddard, Robert B. Lawrence, Clarence M. Roof, John A. Roosevelt, Prof. A. M. Mayer, Henry P. Wells, Archibald Mitchell, James L. Breese, Gonzalo Poey, Dr. Spencer M. Nash, Dr. George Trowbridge, Prof. Silvernail, Frank Endicott and many others who would, those of them who have not passed into the beyond, protest as vigorously as has Mr. Mansfield at being classed as professionals.

Well I remember Mr. Peter Cooper Hewitt's first appearance at Harlem Mere, for I served as one of the judges, when he took first prize from Reuben Leonard in expert trout class. He was obliged to go against the then champion fly-caster because he had been a prize winner at Tuxedo, and casting against a strong wind, he won with a cast of 83 feet, with Leonard second, with a cast of 82 feet 6 inches, to the suprise of all concerned.

Old Records.

In looking over the old score books in my possession,

many of them the official books, I am reminded of something that has been lost sight of. The first tournament at Harlem Mere in 1882 was the FOREST AND STREAM Anglers' Tournament, and upon the organization of the National Rod and Reel Association in 1883 the FOREST AND STREAM tournament was adopted as the first of the Association's tournaments, and the '83 tournament was called the second annual tournament, so that really FOREST AND STREAM inaugurated the Central Park tournaments to determine who were the champion fly-casters. The chief prize in 1882 was the FOREST AND STREAM solid silver punch bowl. Reuben C. Leonard and H. W. Hawes came in as amateurs that year. Hawes got the cup with a cast of 81 feet, with 25 for delicacy and 25 for accuracy; Martin Culhane was second, with a cast of 74 feet, with 24 for delicacy and 20 for accuracy, and Reuben Leonard was third, with the longest cast, 85 feet, as he failed in delicacy, 12, and accuracy, 20. There was one champion class, single-handed fly-casting, won by Harry Pritchard, with a cast of 91 feet, Leonard being second, with 90 feet, and Hawes third, with 85 feet. Except in the champion class Hawes and Leonard took every first prize for fly-casting, and then the rules were changed so that thereafter there were several amateur classes and several expert classes, the chief conditions being that winners in amateur classes were forced into the expert classes, but this by no means implied professionalism. At this moment I do not recall a tournament in which there was a professional class, although this is common enough in England and Scotland.

Mr. Mansfield says he sees no reason for classifying fly-casting records, but the records simply follow the classifications provided by the terms of the contests. If there is no classifications in the contests surely there should be a handicap of some sort to separate the expertly skilled from those less skilled or less experienced. I imagine the novices would soon tire of entering to cast against Mr. Mansfield with his record of 133 feet in the West, or Mr. Leonard with his record of 120 feet in the East, if they had to meet on even terms.

Growth of Rainbow Trout.

Herr Jaffé, the German fish breeder, sends to the London Fishing Gazette a photograph of a rainbow trout of 13¼ pounds, and 26 inches long, which he says was three and a half years of age. As fry, at feeding stage, the rainbows were planted in a pond 50 yards from the sea (the Baltic), with no other trout of this species near them except 200 yearlings in a pond adjoining. The pond broke and a quantity of fry and some of the yearlings escaped to the sea. Two years later 2 and 3 pound rainbows were taken in the net, not over 100 yards from where they entered salt water. The yearlings mentioned were spawned in April, 1896, and three and one-half years later the 13¼-pound trout was caught. Mr. Jaffé concludes that the 2 and 3 pound fish were from the lot of escaped fry spawned in 1897, and the big fish was one of the yearlings of 1896. It is a very deep fish, showing that it had had the richest food that the sea furnishes. My friend Marston, commenting, says it is a remarkable fish, and asks if Mr. Jaffé is sure of the age, as it sounds a bit like longbow. An Austrian fish breder has informed me over and over that he has raised trout (*fario*) to weigh over 2 pounds at twelve months from the egg, and if the rainbows that escaped to the sea from Mr. Jaffé's rearing ponds were the only ones liberated, I do not see how any one can doubt the growth, though it is remarkable, but food—rich food in abundance—will work wonders in the weights of fishes, wonders that require faith to accept them as facts.

Black Bass and Pike Perch in Germany.

This big rainbow reminds me of a note on my hook in regard to the American black bass in Germany, the information also being furnished by Mr. Jaffé. In brief, he says the introduction of black bass into German waters has not been satisfactory. He says: "It feeds here principally on small fish, and its appetite is something phenomenal, while its growth by no means compensates for the amount of food consumed. In very good quarters three-year-old fish will weigh ½ pound, and it is something very rare to find a four-year-old weighing 2 pounds. A great drawback is their early sexual ripeness. Quite small fish of two years of age sometimes spawn and stock the water with such a host of small fry that food for the bigger fish soon gets rare."

He says that the black bass introduced into large coop ponds, ponds of 1,000 acres and more each, where they had good range, to keep down roach, rudd and other plant-eating fish, did not grow as rapidly as they did in his own ponds above quoted, but they did clean out Messrs. Rudd, Roach & Company most effectually. He concludes by saying that it is much easier to introduce the black bass into any water than it is to get rid of them afterward. He thinks the European pike-perch quite fills the place the black bass would usurp: "The growth of the pike-perch is much better than that of the black bass under similar conditions. Three-year-olds will weigh 2 to 4½ pounds, and four-year-olds 5 to 6 pounds. The fish spawn from April to June, and the female makes a sort of nest in a clean, sandy place, and producing 2,300,000 eggs."

Here is a chance for a surprised expression on the faces of American readers who are familiar with our own pike-perch, as they produce only 150,000 to 200,000 eggs on an average, and the record fish at the station of the Fisheries, Game and Forest Commission, a fish weighing 13½ pounds, produced 609,176 eggs. I do not clearly understand what Mr. Jaffé means when he says the eggs of the European pike-perch hatch in two or three days, but assume that he means that length of time after the eggs are eyed. He does not give the temperature of the water. In this country pike-perch eggs hatch in from seventeen to twenty days, with the water at 45 degrees, and from five to ten days more to absorb the yolk sac. As to black bass, I have known them to grow to 7 pounds in four years in the water of a lake in New York State. To be sure, it was exceptional water for black bass, for it has produced the largest on record. What Mr. Jaffé says of the introduction of black bass can be read with profit in this country as well as in Europe, but the advice comes too late for some waters where black bass have been planted so easily and taken root, and now furnish a lot of little fish too small for sport, which cannot be removed to make room for other species that would fit the water and afford food, if not sport; but one might preach for years about the unsuitability of some waters for certain fishes, and the misfit planting would go on just the same.

Salmon Smolts Going to Sea.

Once I was asked on the witness stand if the sea salmon was a fresh or salt water fish, and I replied, a fresh water fish. Why? Because the eggs and fry of salmon die if placed in sea water. Naturally the next question would have been, how do the young salmon get down to sea when they become smolts at two years of age, for certainly they do go to sea before they become either grilse or salmon? Mr. Willis Bund, chairman of the Severn Conservators, has answered this question very clearly: "With us—i.e., in the Severn—the smolts go down in small shoals, and when they get to the tidal water they go backward and forward with each tide for some days, but getting each day lower down, and not coming so far back. I think in this way they become accustomed to the salt water. The proof of this is the gulls and cormorants (there are always plenty of them about in the smolt time) always fish with their head to the tide, up stream when the tide is going out, down stream when it is running up. That is, they wait for the smolts to come to them and doubtless take their toll."

Smolts have been taken in the Hudson River at times, and in such manner as to indicate that they are very leisurely in working down from fresh into brackish and finally into salt water, and shad in like manner begin their descent to the sea in the autumn after they are hatched and become accustomed gradually to the change from fresh to salt water.

A. N. CHENEY.

CHICAGO AND THE WEST

Chicago Fly-Casting Club Smoker.

THE social smoker held by the Chicago Fly-Casting Club at the Union restaurant last Tuesday evening, Dec. 12, was a verp pleasant little affair, some twenty-six members' friends being present. Mr. D. G. Henry, of Grand Rapids, Mich., was the only guest from out of the city.

Medals to the winners of the contests last summer were awarded as follows:

Class A—Long distance fly, I. H. Bellows; distance and accuracy fly, F. N. Peet; accuracy and delicacy fly, C. A. Lippincott; bait, H. G. Hascall.

Class B—Long distance fly, A. C. Smith; distance and accuracy, H. Greenwood; accuracy and delicacy, C. F. Brown; bait, H. W. Perce.

President Bellows presided. C. A. Lippincott gave us an interesting account of a trip for trout on the Nipigon. B. W. Goodsell told us of some of his experience in northern Michigan last summer for trout. A. C. Smith gave us the latest game laws of Colorado as they were interpreted to him in a justice court at Colorado Springs. J. B. Armstrong gave us one of his experiences with a colored lady in Tennessee, and W. T. Church an interesting account of how the blind pickerel in Gross Lake troll for perch. Mr. Henry told about fishing and fishing waters in Michigan. F. H. Peak was end man and had some good stories. Every one present spent a pleasant evening and promised to come again.

The following were present: J. B. Armstrong, I. D. Belasco, I. H. Bellows, C. F. Brown, W. T. Church, L. F. Crosby, J. M. Clark, F. B. Davidson, B. W. Goodsell, H. Greenwood, E. R. Letterman, C. A. Lippincott, G. A. Murrell, F. B. Orr, H. D. Osgood, F. H. Peak, F. N. Peet, H. W. Perce, F. E. Rugg, A. C. Smith, W. Wolfarth, W. T. Foster, O. V. Spindler, J. A. Wood, J. L. Kendrick and D. G. Henry.

E. HOUGH.

480 CAXTON BUILDING, Chicago, Ill.

A German Rainbow Trout.

THE London Fishing Gazette published this letter, written by Herr S. Jaffe, of Osnabrück, Germany:

"You were good enough to give room a few weeks ago to a report of mine concerning some rainbow trout which had been planted by us in August, 1897, as feeding fry and been recaptured as 2 and 3 pound fish during the summer of this year, in the sea, not 100 yards away from the place they were planted. Since then I have had more than one report from my friends at Flensburg, on the Baltic, about similar rainbows having been taken by net fishermen in the harbor; but I have only quite lately come into possession of any of these fish.

"You may remember that the fish were planted by us as feeding fry in a pond not 50 yards from the sea, which pond breaking through in August, 1897, nothing more was heard of these fish for two years. At the time of planting these feeding fry no other rainbows were anywhere near this fishery, except a couple of hundred yearlings in a pond adjoining the one that broke through, and of these fish a few escaped also.

"The fish that has now reached me, and a photo of which I am sending herewith, was, I take it, one of these yearlings—that is to say, a fish spawned in April, 1896, and now three and a half years of age, while the 2-pound and 3-pound fish caught in good numbers during this summer would correspond to the 1897 fish, being now three and a half years of age.

"The fish I have here is a finely shaped female, very well fed indeed, short and plump, and turns the scales at 13¼ pounds, truly an extraordinary growth.

"It is remarkable that these fish have strayed so little from the place in which they were planted, some of them having been up to spawn (as two-year-olds) this spring into the little brook that forms the outlets of the fry ponds.

"The fish is very silvery, but shows the characteristic wide pink side stripe of the rainbow and the beautifully colored orange gill covers quite distinctly. Yours very truly,

"S. JAFFE."

Potomac Black Bass.

The good work of saving bass from the canal and placing them in the Potomac has begun. Captain L. G. Harron, of the U. S. Fish Commission, has seining parties at work in the vicinity of Harper's Ferry.

B. A. BEAN.

Fishing in the Bahamas.

WE started from the wharf in Nassau Harbor at least half an hour before the sun was scheduled to appear. At this early hour it was quite cool, and as the little skiff slowly gained headway on a long tack I almost wished for a light overcoat.

There were three of us: Frank Watson, who owned the skiff and acted as captain, crew and anything else that was undesirable. He lived on the island, just a short distance from the city limits, and was the possessor of a very fine pineapple plantation. We were his guests.

My chum, Roy Randle, and myself were simply a couple of Northern fellows spending the winter in the South. We had made the acquaintance of Frank in the little town of Miami, Fla. From that place a small steamer makes regular trips to Nassau. Frank had such alluring tales of the many varieties of fishing near New Providence that we determined to pay it a visit. Upon our arrival at Nassau he insisted that we make his house our home while on the island. His wife was a pleasant, jolly young woman of about thirty, who did everything possible to make our stay enjoyable. She succeeded.

We were outside of the harbor this morning by the time the sun rose. The mists upon the water showed signs of early disintegration under its rays, and a steady breeze sent the little boat along at a good rate of speed toward an island a few miles from the city.

We had arrived within half a mile of the shore, when Frank lowered the sail, and allowed the boat to drift with the tide. He reached down, took up his water glass, and placing the glass end under the water peered intently through it. This water-glass was made from an old bucket, selected for its length, which was quite unusual, being at least 18 inches. The bottom had been removed, and in its place was substituted a circular piece of glass. This had been caulked, and no water could reach the interior of the bucket. To use it, the end with the glass was inserted a few inches beneath the surface of the water, and the user, placing his face at the other end, looked through it. To us Northerners it was incredible the depth it was possible to see clearly with the glass. Fifty feet was no more than a pane of glass, and twenty fathoms was not an unusual depth to see the bottom. The remarkable clearness of the water is what makes it possible to see so far. I have seen the natives dive and recover a coin in at least 20 feet of water, while we in the boat could distinctly see every movement of the swimmer.

The water where we now were was very nearly ten fathoms. Roy and I gazing far down in those crystal depths could make out quite distinctly the forms of coral. Some distance from the boat we could discern small forms moving about. So minute did they appear that we supposed them to be some species of marine insect, until Frank, who was gazing toward them, took in the glass and informed us that they were grunts.

We rigged our hooks, baiting with a piece of fish, and threw out toward them. Owing to the depth of the water, and perhaps custom, we used hand lines. As our lines sank, assisted by a pound of lead acting as a sinker, we saw the fishes swim toward the hooks, and in less than a minute all three of us were pulling in our lines, each having hooked a fish.

It's real sport to haul in 60 feet of line with a struggling fish on the other end. By the time we had drawn the fish up to the side of the boat he was so nearly exhausted that it was like lifting a log of wood into the boat. Frank, however, when his fish was close to the boat, gave a sharp jerk and his fish came flying into the boat. Roy and I lifted ours aboard in the same manner we would lift in a bucket of water.

I was startled, momentarily, by hearing a long-drawn-out sigh, coming apparently from back of me. Then followed another, and then a third. That was the secret of the peculiar name applied to the fish. The noise they make as soon as they are out of the water sounds very much like a grunt. These we had caught were of the same size and would weigh about 2 pounds each.

We continued fishing for grunts for half an hour, and during this time caught seventeen, all similar in size to those we had caught first. Then they stopped biting, and as we drifted quite close in toward shore, Frank took the oars and pulled out toward our first position.

When in that vicinity again, he handed the oars to Roy and took up the water-glass. He directed Roy to pull slowly around in a circle, while he looked intently toward the bottom. After a few minutes he signaled Roy to hold the boat motionless and for me to come to him.

Following his directions, I took hold of the glass. Through the glass the bottom appeared so near that it seemed as if I could touch it. Looking in the locality described by him, I saw a dark opening near the base of the coral. It looked like two large stones set in the form of an inverted V. Just in front of the opening, the water was a little discolored, as if some large fish had recently disturbed the sand on the bottom.

"Now, Roy," I heard Frank say, "there is a grouper down there. Just throw your line out so that it will reach the bottom near that coral and you will have some royal fishing."

A splash followed. Then I saw the sinker reach the bottom a short distance from the cave, and I looked at the opening. Soon the head of a large fish appeared in sight. Then there emerged from the darkness a fish a yard long and moved toward the hook. With the aid of the glass, I could see the movements of his fins, as he advanced to smell of the bait. Evidently he liked its odor, for he drew back, then quickly dashed forward, seized the bait and started to swim away with it.

"Roy!" I cried. "You have him! Pull!"

He gave a sharp tug at the line. The fish was swimming when Roy struck him, and as the hook entered his flesh, how he did accelerate his speed! I should have liked to have watched the struggle through the glass, but the fish ran in such a direction that there was great danger of the line getting tangled about it. So I took it up and put it in the boat.

For forty minutes Roy had all the fish he could attend to, and at times it looked doubtful whether he or the fish would obtain the mastery. Finally it was drawn alongside, where Frank dispatched it with a blow from a club

carried for that purpose, and we lifted it aboard.

It was what Frank called a grouper. Just why, he was unable to say, as the fish are invariably found singly and under rocks or coral, and sometimes attain a weight of 40 pounds. The one we had weighed 26 pounds when we reached shore several hours later.

We cruised in the vicinity for a long time, and made several unsuccessful attempts to catch another grouper. We fished in several places where Frank was certain they were, and used all varieties of bait we had, but they refused to bite.

On the way back to Nassau we struck a school of market fish and caught a dozen, that weighed over 40 pounds. They were very gamy, and later we found them splendid eating.

This is but an account of one day of our week spent on New Providence. Never did I enjoy more sport fishing, and never did I meet a more cordial host. It was with great regret that Roy and I left the pleasant shores of the island, and prominent among my thoughts was this: "Some day I'll come back," and I will.

FIELD TRIALS.

1900.

Jan. 22.—West Point, Miss.—United States Field Trial Club's annual trials. W. B. Stafford, Sec'y.

Feb. 5.—Greenville, Ala.—Alabama Field Trial Club's fourth annual trials. T. H. Spencer, Sec'y.

Nov. 18.—Newton, N. C.—Eastern Field Trial Club's twenty-second annual field trials. S. C. Bradley, Sec'y, Greenfield Hill, Conn.

Continental Trials.

THE open trials of the Continental Field Trial Club began on Monday, Dec. 11. The grounds of the Eastern Field Trial Club were used to determine the competition, the two clubs sharing the rent and using the grounds in common. The Eastern Club, as is proper, reserves the right to run its trials first. After the first trials are finished, owners and handlers have a good knowledge of the form of their own dogs, and that of the dogs which they have competed against. As most of the dogs are entered in both trials, the unpromising dogs are not likely to be started in the second trials. The best field trial judges are so nearly alike now in their estimates of good and bad performance, that dogs which do not get into the second series in the first trials are not started in the second trials. So long as the Continental trials follow so closely after the Eastern, just so long will it have its entries culled on the data afforded by competition in the Eastern. This weeding out process will tend to make a higher class of competition, since it reserves the better dogs and eliminates the commonplace, but it also cuts down the number of starters appreciably, and thus cuts down the revenue of the club more than is in consonance with the amount of the prize money. There is no remedy for this under the present circumstances, but it, in a measure, may be lessened by both clubs increasing their membership, as they in fact are doing at present, and broadening out their support. Both clubs have been materially strengthened with some excellent additions in the way of good sportsmen, and in the policy of substantial growth lies the prosperity of the future. The clubs this year had money on hand after all expenses were paid, a state of affairs most gratifying to all concerned.

The quality of the competition was very good as a whole. Indeed, some of the work was of great excellence. The peculiarities of the competition exacted a higher degree of ability on the part of the dogs than is generally the case at field trials, for first the birds seemed wilder, kept closer to cover and took longer flights than at this season in former years. After the first flush they were very difficult to find. They frequently took to the tree tops, and but a few—one or two or three—could be found on the ground in such instances. When a bevy would light on the ground, the birds would scatter and run fast and far, and the flush of one was the signal many times for the flush of others. These conditions exacted a high degree of ability to make a good showing. The birds were in fair numbers, but diligent work was required to find them under the conditions enumerated.

There was quite a company of visitors which followed the trials day by day. Among these were Messrs. Hobart Ames, the president of the club; Theodore Sturges, the club secretary, the former from North Easton, Mass., the latter from New York, and both earnestly active in promoting the club interests. There also was the famous painter of field scenes, Mr. Edm. H. Osthaus, of Toledo, O.; Mr. John H. Schumacher, of Los Angeles, Cal., who planned to hurry westward after the trials were over to the end that he might spend Christmas at his home. He was a painstaking follower of the trials, and regretted that the Sweepstake was not run so that he might enjoy them longer. He had much of interest to narrate of trials on the Pacific Coast, and had a very sound perception of what were the requirements of good competition. If the fates should ordain that he visit the North Carolina trials again, he will be the recipient of a warm and friendly welcome. There also were Mr. Chas. H. Phelps, Jr., and his sister, Miss Julie G. Phelps; Mr. S. C. Bradley and his daughter, Miss Elizabeth Bradley; Messrs. Theo. R. Hoyt and Edw. C. Hoyt, New York; Chas. W. Keyes, of East Pepperell, Mass.; E. D. Libbey, Toledo, O.; A. C. Peterson, Hempstead, Pa.; J. F. Bell, Carmichael, Pa.; Geo. Nesbitt, Wilkes-Barre, Pa.; Maj. J. M. Taylor, Rutherford, N. J.; C. E. Buckle, Charlottesville, Va.; G. Armstrong, Jamestown, N. C., and others.

The judging was done by Messrs. Edm. H. Osthaus, Chas. H. Phelps and B. Waters. Their decisions were received as being sound and satisfactory.

The Sweepstake was declared off, there not being the necessary number of entries to make it of sufficient importance to run. The entrance was $25, entries to close the night before the running. This probably will be changed to a subscription stake next year, and then there will be no dawdling nor indecision when the time comes to play or not to play.

The Derby—Monday, Second Day, Dec. 11.

A HEAVY, black sky portended rain, a continuation of the rainfall of the night. The storm did not begin till near lunch time, and then the rain fell so heavily that the competition was declared off for the day. The first series was completed except the running of the bye dog. The competition was quite good in its best parts, and quite ordinary in its poorest.

There were eleven starters, run in the following order:

Dr. M. F. Rogers' l. and w. pointer dog Brant (Von Gull—Baby Ruth), D. E. Rose, handler, with Dr. C. I. Shoop's b., w. and t. setter dog Count Hunter (Count Gladstone IV.—Hunter's Queen), J. H. Johnson, handler.

Hobart Ames' b., w. and t. setter bitch Bona (Tony Boy—Christina), D. E. Rose, handler, with P. Lorillard, Jr.'s, b., w. and t. setter bitch Geneva (Tony Boy—Lena Bell), C. Tucker, handler.

Dr. C. I. Shoop's b., w. and t. setter dog Harwick Boy (Harwick—Spot's Girl), J. H. Johnson, handler, with Geo. Crocker's o. and w. setter dog Bob Acres (Tony's Gale—Minnie T.), S. C. Bradley, handler.

Arthus Stern's b., w. and t. setter bitch My Sue S. (Antonio—Robin's Cora), W. H. Hammond, handler, with Avent & Duryea Kennels' b., w. and t. setter bitch Sioux (Count Gladstone IV.—Hester Phryne), Geo. E. Gray, handler.

O. D. Stuart's o. and w. setter bitch Trixie (Kingston—Duke's Ruby), D. E. Rose, handler, with Arthur Stern's lem. and w. pointer bitch Bootsie S. (Young Rip Rap—Dolly Jingo), W. H. Hammond, handler.

W. N. Lipscomb's b. and w. pointer bitch Croxie Kent II. (Rip Rap—Croxie Kent), Samuel L. Jordan, handler.

This stake was open to all pointe and setter puppies whelped on or after Jan. 1, 1898. First forfeit, $10, due July 1; second forfeit, $10, due Sept. 1; $10 additional to start. Entries closed July 1. To first, $250; to second, $150; to third, $100.

Geneva, winner of first, repeated her good performance of the Eastern trials, so far as excellence of class is concerned. She ranged wide, and displayed very good judgment in beating out her ground. Her capabilities as a whole are excellent.

Sioux ran in greatly improved form over that displayed in the Eastern trials, three weeks previous, her work to the gun being distinctly better. She ranged within bounds, and was easily the second best dog in the stake.

Count Hunter, third, displayed good natural qualities, but he is rankly disobedient and inclined to self-hunt at times, so that he worked to the course in a most imperfect manner. He was third on a very narrow margin.

First Round.

Brant and Count Hunter were cast off near Gibson's, at 8:46. Count pointed a bevy in open sedge and was nicely backed by Brant. On the scattered birds in pine woods Brant made three good points on singles, and Count made one, though he pointed on the trail of a bird which, while roading to locate, was pointed by Brant. Brant next, near pine woods, made game and roaded truly to some birds, pointing betimes as he drew near them. He was steady to shot and wing. The judges did not see the conclusion of this roading, as some pines hid the dog from view, but he presumably pointed. Both ranged well and at good speed. Up at 9:30.

Geneva and Bona ran a rather patchy heat, owing to the handlers separating repeatedly in a rather nervous hurry to find their dogs if they disappeared from view for a few moments. Geneva pointed in sedge, and, roading to locate, Bona, which had been backing, roaded quickly to the bevy and pointed it. The credit of the find was Geneva's. Bona flushed a single and each made a point to which nothing was found. Sent on, Geneva pointed a bevy in open weeds and Bona backed nicely. Each made two points on the scattered birds, and Geneva backed a point of Bona prettily; but there was no bird to it. Each ranged well. Geneva was the better in beating out her ground, and in her finding and point work. Up at 10:35.

Harwick Boy and Bob Acres were cast off at 10:46. Boy soon pointed a bevy in a plum thicket, and was backed by Bob. The former broke shot for a moment, but was steady to order. Each then pointed uncertainly, Boy being the greater offender. He also flushed a single. Up at 11:31. Their range was middling, and their performance on birds was ordinary.

My Sue S. and Sioux were cast off at 11:34. Sioux pointed a bevy in heavy weeds in a bottom; Sue backed steadily for a few moments, then broke her back. Both were steady to shot. The birds went to heavy cover and were not followed. Sent on, Sioux found and pointed a bevy in the open and was backed well; it was a very finished piece of work. Again the birds went to dense cover. Next Sioux pointed in dense cover, and nothing was found. She made a very superior competition, ranging well and within bounds, and beating out her ground with judgment. Up at 12:01. Sue's performance was commonplace. Sioux's field form was decidedly better in every way over that displayed in the competition of the Eastern trials.

Trixie and Bootsie S. began at 12:03 and ran till 12:38 without finding. Their range and judgment were commonplace.

Heavy rain set in in the latter part of the heat. After lunch the party returned to town in the rain, the weather being unfit for further competition.

Tuesday, Third Day, Dec. 12.

The eather was clear, cool and bracing. A moderately stiff wind was blowing at the start, but toward noon the temperature was warmer and the wind died away to a gentle breeze. Torrents of rain fell during Monday night, so that the grounds were very muddy in consequence. A start was made at the Conover end of the grounds.

Croxie Kent II., the bye dog, was cast off at 9:10. Her range was rather narrow. She pointed a bevy nicely and was steady to shot. She, in searching for the scattered birds, flushed one. Up at 9:44.

Second Round.

Six dogs were retained in the running.

Brant and Harwick Boy were cast off at 9:56. Boy flushed a bevy and made a point on a single. Brant made a slack point on a bevy and was steady to wing. At the same time Boy pointed a bevy about 200 yards away. They were worked on the scattered birds, but failed to find them. Neither dog made so good competition as in the previous series. Up at 10:35.

Count Hunter and Geneva were cast off at 10.48. Geneva made a good find and point on a bevy. The brds were followed. Count pointed; nothing found; foot-scent probably. Geneva roaded and pointed alternately, but could not locate. The dogs were swung into the open to seek another bevy. As the judges rode toward the edge of woods they flushed a bevy, and then both dogs were seen standing on point in the woods near where the bevy flushed. Up at 11:40. Count was almost lawless in his ranging, paying little attention to his handler or his handler's commands. He hunted diligently, however, though very imperfectly to the gun.

Sioux and Bona ran from 11:48 to 12:24 without finding, and the competition was then suspended while the party lunched.

Final.

Sioux and Geneva were started at 1:37. Soon, just inside thick pines, a bevy was seen to flush, and one of the dogs could be seen flitting to and fro near the scene. Next in open sedge a bevy was seen to flush and Sioux was close by it at the time. Sent on, Sioux flushed a single. Geneva next, in open sedge, pointed, drew cautiously about a bit and pointed the bevy nicely. She showed the better judgment and better performance on birds.

The winners were then announced as follows: First, Geneva; second, Sioux; third, Count Hunter.

The All-Age Stake.

This stake was begun as soon as the Derby was decided. The number of starters was not so large as was expected, but they were of higher merit than the average.

The Continental trials labor under the disadvantage of following soon after the Eastern, when the relative merits of the dogs are pretty well determined, and further competition depends largely on improved form.

This stake was open to all setters and pointers which had not won first in any all-age stake of previous seasons at any field trials recognized by the Continental Club. Entries closed Oct. 15, with $10 forfeit and $20 additional to start. To first, $250; to second, $150; to third, $100.

There was a good attendance of sportsmen, who followed the trials diligently day by day.

The dogs were run as follows:

J. W. Hamer's b. and w. setter dog Toby's Bob (Brighton Tobe—Rill Ray), A. P. Kirk, handler, with G. G. Williamson's b., w. and t. setter dog Lady's Count Gladstone (Count Gladstone IV.—Dan's Lady), D. E. Rose, handler.

Pierre Lorillard, Jr.'s, b., w. and t. setter dog Pink's Boy (Gleam's Pink—Belle of Pawling), C. Tucker, handler, with W. P. Austin's liv. and w. pointer dog Lad of Jingo (Jingo—Dot's Pearl), D. E. Rose, handler.

Geo. E. Gray's liv. and w. pointer dog Young Jingo (Jingo—Pearl's Dot), owner, handler, with D. E. Rose (agt.) liv. and w. pointer dog Alex C. (Glenbeigh—Saddlebags), D. E. Rose, handler.

H. R. Edwards' b., w. and t. setter dog Colonel R. (Harwick—Trap, Jr.), Geo. E. Gray, handler, with P. Lorillard, Jr.'s, b., w. and t. setter dog Jack (Eugene T.—Maud), C. Tucker, handler.

H. K. Devereux's b., w. and t. setter dog Uncle B. (Harwick—Dan's Lady), Geo. E. Gray, handler, with George Crocker's o. and w. setter bitch Minnie's Girl (Antonio—Minnie T.), S. C. Bradley, handler.

P. Lorillard, Jr.'s, b., w. and t. setter dog Roland (Eugene T.—Lou), C. Tucker, handler, with J. W. Hamer's b. and w. setter dog Toby's Mark (Brighton Tobe—Rill Ray), A. P. Kirk, handler.

Colonel R., the winner, made a most excellent competition. He ranged fast and wide, yet with judgment and to the gun. His finding and pointing were skillfully done and with good finish. He works merrily and industriously.

Lady's Count Gladstone, second, while not an extremely wide ranger, was very wise in beating his ground and successful in finding and pointing. He carries himself well, and has quite a wise way of going to the places where the birds are to be found.

Lad of Jingo ran in greatly improved form over that displayed in the Eastern trials. He was steady on point and back. His first heat was excellent. His second was marred by some inaccurate point work and by momentary fiddling on false scents occasionally.

First Round.

Toby's Bob and Lady's Count Gladstone began at 2:43. Count pointed, then roaded across a thicket some 30 yards, and pointed a bevy. Sent on, Count found and pointed another bevy nicely. Up at 3:26. Count had much the better of the heat in every particular. Bob made an inferior competition.

Pink Boy and Lad of Jingo started at 3:32. Lad beat out his ground well and made two good finds and points on bevies. On the scattered birds Pink made three good points, one of which was shared by Lad. Up at 4:08. Boy false pointed at times. Lad ran in very fine form, pointing and backing well, and beating out his ground with good judgment.

Young Jingo and Alex C. started at 4:14. In a cornfield Alex flushed a bevy. Jingo made four points on singles and found and pointed a bevy well. Alex found and pointed a bevy in open sedge. Each dog backed well. Up at 5:05. Jingo had much the better of the heat.

This ended the day's competition.

Wednesday, Fourth Day, Dec. 13.

The weather was clear, cool and calm in the morning;

warm toward noon, and a bit too warm for comfort in the afternoon.

Jack and Colonel R. were cast off at 9:12. Colonel found and pointed two bevies, and flushed a third. Each made a good point on singles. Colonel ranged with the better judgment. Both went wide in their casts. Up at 9:55.

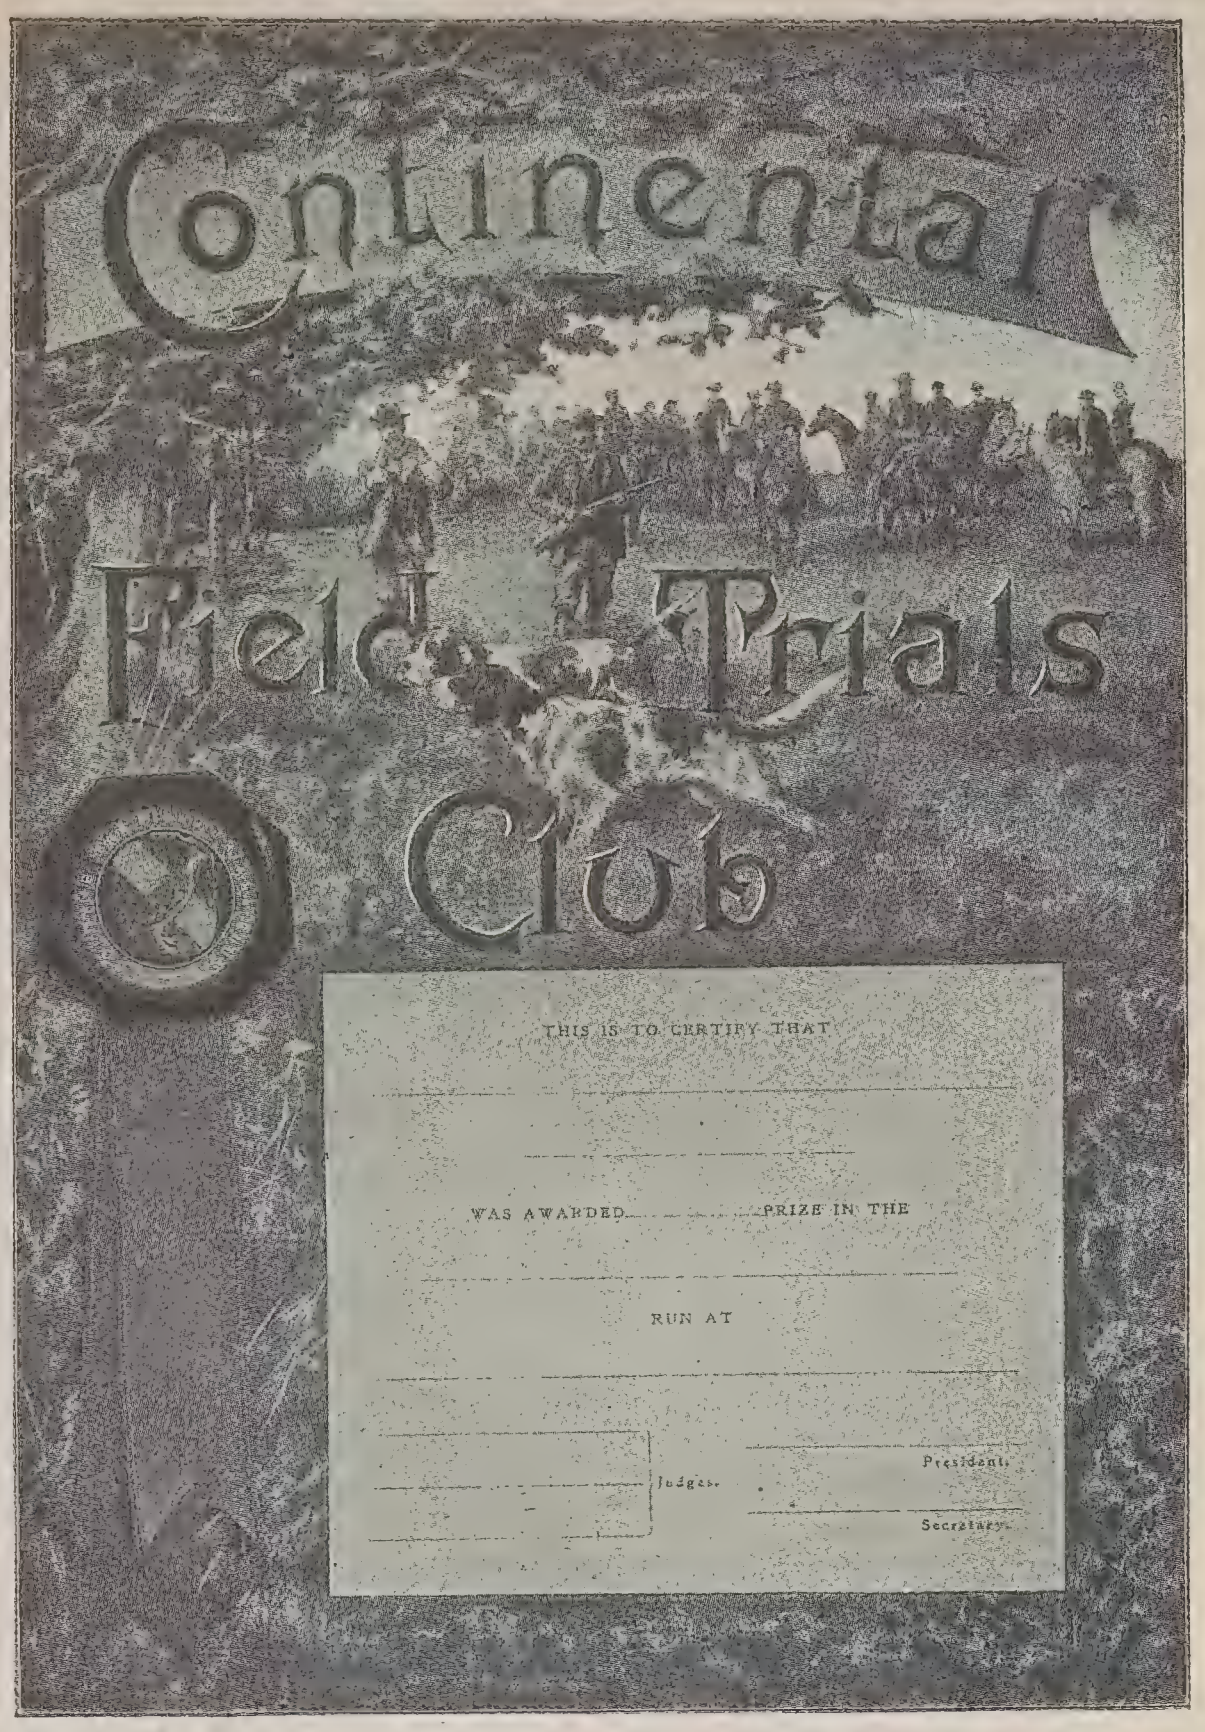
Uncle B. and Minnie's Girl were started at 10:02. Uncle made a stanch point, which Minnie backed well for a while, then broke her back. Sent on, Uncle pointed a bevy and Minnie backed well. On the scattered birds they made a poor showing. Minnie pointed and moved on, and some birds were flushed close by where she pointed. Uncle pointed and nothing was found. Up at 11:11. Minnie appeared to be off her nose, while Uncle's work was both good and faulty.

Roland and Toby's Mark began at 11:31. Roland flushed one bevy and pointed another. He had a moderate range, but excellent judgment. He was rather slow in his gallop. Mark made an inferior competition. Up at 12:16.

The party next went to lunch at Yount's place.

Second Round.

Lad of Jingo and Colonel R. were cast off at 1:30. Colonel made three points on singles, and, standing in a creek, pointed nicely a bevy on the bank some 3 or 4 feet above him in the field, and some feet away from the creek. It was a very pretty piece of work. Lad pointed a single, flushed one, and made several points to which nothing was found. Both were fast and wide rangers, Colonel the better. His judgment in beating out his ground was excellent. Up at 2:28.



Young Jingo and Lady's Count Gladstone were cast off at 2:43. Count found and pointed three bevies. Jingo found and pointed one bevy, and in coming to back pointed a bevy which Count had found and was pointing. Jingo covered more gorund, but he did not work to so good purpose as did Count. Count made two points to which nothing was found. Up at 3:48.

Jack and Uncle B. began at 3:48. Uncle took a long cast, and standing on a wheat field pointed a bevy which was in the weeds at the side. Jack next flushed a bevy. The dogs were then worked on the scattered birds, but could not be kept in hand. They kept on ranging, and Uncle pointed a bevy, Jack at the same time pointing on the footscent. After this both dogs broke away from control and were lost some minutes. Up at 4:25.

Final.

Colonel R. and Lady's Count Gladstone were cast off at 4:33, to comply with the rule which requires first and second to run together. Both dogs took a cast to the woods, and Count there made a point on some scattered birds. Up at 4:42.

The dogs were placed as follows: First, Colonel R.; second, Lady's Count Gladstone; third, Lad of Jingo.

THE CONTINENTAL CERTIFICATE OF AWARD.
From a drawing by Edm. H. Osthaus.

"Speaking of Dogs."

Editor Forest and Stream:

I see your readers are beginning to write of the dogs they own or have owned. Why cannot we have more of it? There is an old saying that a poor man will have one dog, but a very poor one will own two or more. I am in that latter class and will write of old Ben, how I came to get him and what he is good for.

A few years ago I became acquainted with an officer in a town not far from New York where they have a dog pound. I told him if they ever took in a nice bird dog not to kill him, but let me know and I would pay the necessary charges and take him out. I had forgotten all about it, when one day about six months ago I got a call on the telephone: "Have a dog for you. What train do you go up on?" I told him, and when the train rolled in I went into the baggage car, and there was my dog. No name to call him—nothing but an old rope around his neck. I called him Ben and he made friends at once. He paid no attention to the noise and bustle of the train, for, as I afterwards found out, he was used to it and had been all over the country on hunting trips with his former owner. I took the old fellow home. He was a big white English setter, finely feathered, with coal black ears, a fine shaped head. I fed myself and Ben and went to bed. About 12 o'clock Ben came to the side of the bed and barked twice and then ran to the door, as much as to say, "I want to go out." I dressed and took him out. He still does that. If he wants a drink he will go to the sink and bark; and if not attended to at once will come and root you with his nose. When he is out, if he wants to come in he will come to the door, put his paw on the knob and rattle it. If that brings no response he will bark.

I kept him all summer, but had no chance to try him except on Sundays, and found that he knew what was wanted of him. When one night I went home and was told that Ben was afraid of thunder I thought I had a gun-shy dog; but I got a shell that had been fired and the gun. He smelled them all over, wagged his tail and ran to the door. Then I knew that everything was O. K.

Well, Nov. 10 came at last and 4 o'clock found me at a breakfast of pancakes and sausage, Ben sitting alongside waiting for his share. After breakfast we had a seven-mile drive. Old Ben crawled into the back part of the wagon, at home anywhere. We put our team up at a farm house and started. What a peach Ben is! He is as fast as the fastest; very careful; no fooling; nothing but hunt, in every slough, around every brush heap, that old tail of his going to beat the band. If you went up one side of a hedge fence old Ben was on the other side. I was the proudest man in the county. I have been out with him often since, and it is the same thing. We may not get much game, for game is scarce, but it is sport to see that old dog work. Go in for dinner at noon, and he will act so tired that you will say, "I will leave him in for the afternoon." But then he will take a snooze and be just as fresh as in the morning. I have had him out with some of the best setters about here. They are not 1—2—6 with Benjamin. He is first to find birds and first in every bush and brier patch. But why shouldn't he be? The old dog was educated for that.

I have found out all about him. Old Col. ——— brought a little pup from England ten years ago and put him in the hands of a trainer (could not find out name of trainer). Cost the Colonel $10 to have him broke. The Colonel had plenty of means and did nothing but hunt, always taking the dog with him. That is why he has such good manners on a train or in a wagon or house. It is too bad he cannot talk. I often sit and hold his head in my lap and wish he could tell me about his different hunting trips. He would likely tell about once in Florida when he came near being gobbled up by a big alligator, or how close he had been to a bear up in Maine, or a wildcat may have chased him out of her home. He is no fighter—minds his own business all the time. Has no use for rabbits; will point them, but never chases them.

The old Colonel died about three years ago, and before he died gave the dog to an old hunter to keep until he died. Ben outlived them all. The old hunter died, and Ben was without a home. Then came the dog pound. That is how I came to own a dog that cost $100 to break. I only wish he was about four years old; but from all appearance he is good for two or three years more. I have had him stolen from me twice and he has been poisoned once.

He has two bad habits—likes chickens and will get on a clean bed. I would not part with the old fellow, for who could take his place? Who would meet me at the door every night? And the last thing I hear in the morning is the old fellow's bark wanting the door opened to follow me. What if he does get me all covered with white silky hairs? They will all brush off. He don't want any salary Saturday night. Just give him a good bed and plenty to eat and take him out hunting once in a while or for a walk on Sundays. Where can a truer friend be found than a good bird dog? They tell no tales, make no trouble—unless perhaps once in a while with the neighbors' chickens. I would like to know what would make a dog afraid of thunder. If a thunder storm comes up Ben pulls for home in a hurry.

ABIB.

What Should He Do with It?

Editor Forest and Stream:

I wish you would tell me what to do with my dog. He is a big fellow, weighs 160 pounds, half rough and half smooth haired St. Bernard, and handsome as a picture. But such a nuisance! I confess I didn't bring him up in the way he should go, and now that he is old (two years) he departs from it. I spared the switch and spoiled the dog.

Every morning at 9:30, when the mail carrier has passed my house, he plants himself at the front door and waits for me to go to the post office. If I do not come soon he whines. If I still delay he howls, and tears run down his cheeks. When at length I come out he frisks. At 1:50 P. M., the time for the afternoon mail, the same thing over again.

Now, 160 pounds of brownish-yellow dog performing antics on a narrow country sidewalk and not always having sense enough to get out of the way is sometimes an annoyance. I can scarcely endure him. I don't see what makes him act so, for I hardly treat him with decent civility. I never flatter or play with him, only once in a while I pat him on the head and tell him what a good dog he would be if he wasn't so useless. Indeed, I often use his great body for a footstool while I smoke my pipe and read FOREST AND STREAM.

After the post office episode, when he isn't quietly waiting on the piazza for somebody else to invite him to go to walk, he usually wants to lie in a certain place in the kitchen, right where all the servants and everybody else having business in that department will have to step over him. And yet if I attempt to administer a harmless but ceremonious kick, like Sam Weller's to the Fat Boy, I meet looks of surprise and disapproval, and if any of the family happens to be in sight I get words of reproach.

And the creature is of no use.

There is scarcely a boy in the village the least bit afraid of him, and scarcely a cat that will perk up her tail when he passes. Only three ducks and a parcel of hens skedaddle when they see him coming, though he never deigns to notice them. If a whole regiment of tramps were to parade through the house I doubt if he would do anything but put up his paw and ask to be petted.

Last summer I had him at the lake, and when I went away for two days he just sat on the extreme end of the boat landing and silently wept. I didn't know dogs could cry that way.

Now, what shall I do with that animal?

Once I threatened to have him shot, but everybody—dog and all—knew I wouldn't, so nobody minded me.

Then I made an arrangement to give him away. But my women folks made such a fuss and said the poor thing would be so lonely and would not get enough to eat, and have such a bad time generally, that just to keep peace in the family, I have never asked the man to come for him. So here he is yet and my feet are on him as I write, the great, splendid, good-for-nothing fellow.

So, dear FOREST AND STREAM, please tell me how to get rid of him. But, if you please, do not recommend any harsh measures. Those women are so tender-hearted and silly.

G. DE MONTANBAU.

J. Otto Donner.

ON Tuesday of last week a good and famous sportsman, Mr. J. Otto Donner, passed away. He died in the Holland House, New York City. A few years ago he was actively identified with bench show and field trial in-

terests, as owner, exhibitor, etc. He owned a number of good dogs, some of which he ran in the field trials. He several times acted as judge at High Point, N. C., in the competition of the Eastern Field Trial Club, of which he was a member and officer, and he also acted as judge at the Westminster Club's bench show some years ago. Of late years he turned his attention more particularly to horse breeding and racing as a sport, and held a conspicuous place among the noted horsemen of America. Of sterling integrity, amiable disposition, high intelligence and pleasing personality, he held a high place in the esteem and affection of all who knew him.

Points and Flushes.

Prof. Edm. H. Osthaus left Newton soon after the trials ended, going thence to High Point, N. C., to make some studies of dogs owned by the Messrs. Hoyt, for whom he will make some portraits in the excellent manner for which he is famous. Thence he returns to Toledo, his home, and soon thereafter he will proceed to Florida for the winter months.

An event of the Continental trials was a possum hunt, engaged in one night by Messrs. Nesbitt, Osthaus, Sturges, Keyes, Mr. Phelps and sister, and Mr. Bradley and daughter. The hunt was a success, four possums being captured before midnight. Several who were very enthusiastic when the hunt was first proposed, had "colt feet" when it was time to start. It takes the right kind of blood to follow the setters and pointers all day and the coon dogs by night.

The preserve of the Eastern and Continental field trial clubs was added to by leasing about 2,000 acres more land. The next Members' Stake will be run, commencing Nov. 18, next year, and in the public stakes the same purses will be offered and the same rules will govern as obtained this year.

Messrs. Ames and Keyes stopped over at Charlottesville, Va., with Mr. Buckle, to enjoy a coon hunt. There are some famous coon hounds there, which are as skillful in driving a coon into a tree as Davy Crockett of old was in picking it out.

Mr. Hobart Ames, the president of the Continental Field Trial Club, has materially strengthened his kennel by the purchase of Young Jingo (Jingo—Pearl's Dot) from Mr. Geo. E. Gray. The sale was made soon after the recent trials were ended. He is a strong, vigorous dog physically, and a first rate performer in the field. He is a successful field trial competitor.

Yachting.

Following the sale of the schooner Alcæa to Lord Sholto Douglas comes the sale of Lasca by Gen. James S. Watson to Dr. Walter von Bruening, of Berlin. The two will join Yampa, now in German waters, as the property of the Empress of Germany.

Another important change from sail to steam comes with the purchase by Com. Postley, Larchmont Y. C., of the new steam yacht Alberta, from A. E. Tower, Esq., of Poughkeepsie. The yacht was built last year from the designs of Gardner & Cox, and is 185ft. over all, 163ft. 6in. l.w.l., 22ft. beam, 11ft. depth and 8ft. draft, with twin screws. She has been taken to Manning's Basin, South Brooklyn, for interior alterations; her name will be changed to Colonia II. While Com. Postley has not sold Colonia and may race her this year, his purchase of a large steam yacht after owning the crack American racing schooner, shows the trend of modern yachting away from the larger racing craft and into steam.

Audax.

The accompanying illustrations show the arrangement and construction of the keel yawl Audax, whose lines were published last week. The cockpit is water tight and self-draining, just deep enough to make a comfortable seat on the deck. The companion opens into the main saloon, 7ft. 6in. long with a sofa locker on each side, making up two berths if needed. Forward of this is the stateroom, the full width of the yacht and 6ft. 6in. long, fitted with a permanent berth on each side, with drawers beneath. It is divided from the saloon by half bulkheads on each side and a heavy curtain. Forward of this is a space of 2ft., fitted up to port with a refrigerator and to starboard as a toilet room. The space forward of this is devoted to the galley and forecastle, one man being carried regularly. While there is a good deal of accommodation condensed into limited length and beam, the arrangement is such as to give very fair accommodations, and in the form of two separate rooms with toilet. To a great extent, as already explained, the hull was built about the cabins, but the resulting compromise gives about as good results as are possible under the assumed conditions. The headroom is 6ft. in saloon and stateroom.

The following specifications give the construction in detail; in building some changes were made, the frames being in part steamed and bent, but the general arrangement and sizes are as here given. The peculiar keel contour, with its many angles, made the usual construction with a straight horizontal keel directly on top of the lead unadvisable. The wood keel was lowered as far as possible at the heel and raised as high at the fore end as the floor would admit, thus making it possible to use one long, straight piece, with a single crook for the stem. Similarly, the horn timber was carried down to meet the keel, amidships. As it was intended to use the metal balanced rudder, the sternpost was not carried through the horn timber. On four of the main frames in the middle, double knees were used after the plan employed by Mr. A. Cary Smith in Rajah, some years before, there being a pair of knees, one to port and one to starboard, to each frame, each knee having one arm across the broad keel and one up alongside the futtock. The keel bolt came up between the arms of the two knees where they crossed the keel; owing to the depth of deadwood and keel and the limited depth inside, the usual keelson was omitted, and in its place the bolt was set up on a chock of oak resting on the two arms of the knees.

The beam clamp was carried clear up to the under side of the planksheer, the beams being jogged down into it and the planksheer fastening to the clamp and beams along its inner edge. The specifications are as follows:

Specifications for Keel Yawl Audax, 1892.

DIMENSIONS.

Length, fore side of stemhead to after side of taffrail, 42ft. 6in.; l.w.l., 30ft.; beam, 10ft. 3in.; depth, planksheer to rabbet at midship section, 6ft. 5in.; draft, 6ft. 6in.; freeboard, 2ft. 3in.

MATERIALS.

To be of the best quality throughout, all wood to be sound and well seasoned, and free from loose knots, shakes and sap; the decking and planking of topsides to be free from all knots. All crooks of stem, horn timber, frames, etc., to be of natural sweep, and not graincut.

GENERAL CONDITIONS.

The yacht to be built under a shed. All work to be done to the satisfaction of an agent appointed by the owner. All work not here specified, but that is shown on the drawings, or manifestly necessary to complete the yacht in a workmanlike manner, to be done without extra charge. Any change in specifications or design necessitating no extra expense for labor or material, to be carried out free of charge; and where increase of cost for either can be demonstrated to the satisfaction of the owner's agent, the same to be allowed for. All extra work to be done at a cost to be agreed on by owner and agent.

FRAME.

Keel—Of white oak, sided as per drawing and moulded 6in.

Stem—Of white oak, grown to shape, sided 6in. and moulded 9in. Extreme fore end, billet head, may be of white pine.

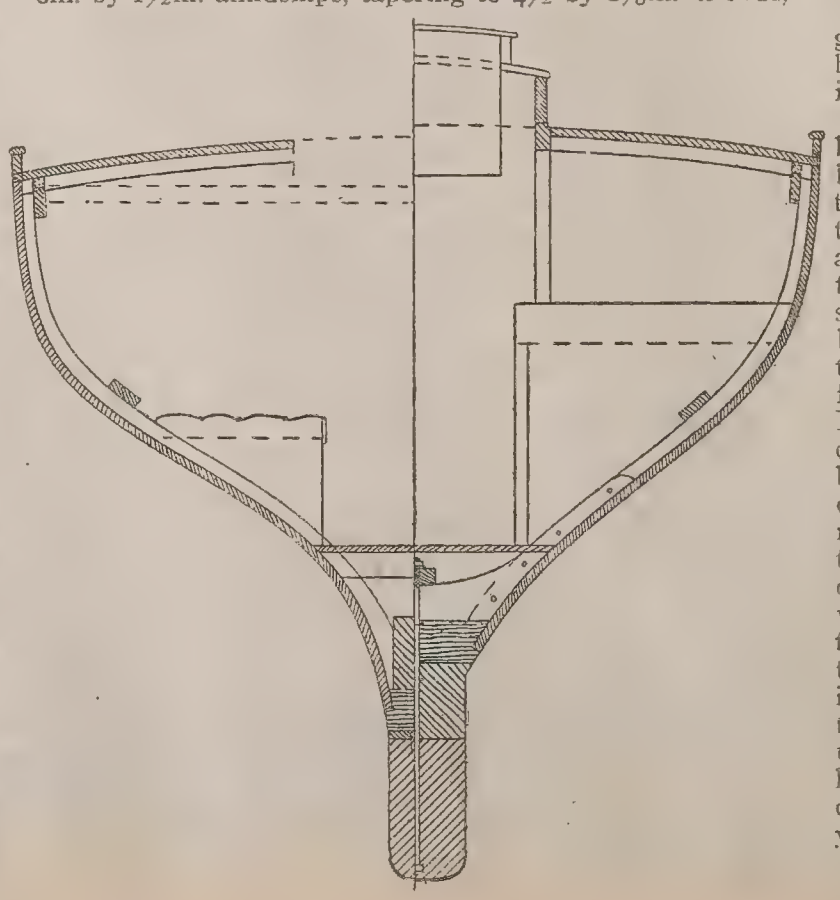
Sternpost—Of white oak, heel tenoned into keel and head jogged into and bolted to horn timber. No score for rudder will be needed.

Horn Timber—Of hackmatack, grown to shape, sided 6in., tapering to 3in. at after end, where it tenons into transom. To be moulded not less than 9in. at heel and 6in. at waterline, and rabbeted for plank ends.

Transom—Of oak or hackmatack, shaped as per drawings, with rabbet for deck and planking; to be well bolted to horn and quarter timbers. All extra wood to be cut away as much as is consistent with strength.

Quarter Timbers—Of hackmatack, shaped as per drawings, and well fastened to transom, planksheer and sheerstrake.

Mast Steps—For mainmast to be of oak, well bolted to stem; for mizzen, mortise to be cut in horn timber. Both to fit masts provided by owner.



Deadwoods—Of white oak or yellow pine, between sternpost and horn timber, and outside of main keel between it and lead keel. A solid chock of oak 6in. by 9in. to be fitted on horn timber up to floor of cockpit to take brass rudder tube.

Stopwaters—Of dry white pine, ½in. diameter, to be carefully placed in all joints of keel, stem and deadwoods.

Frames—Of sound hackmatack, natural shape, to be single sawn and spaced 12in. centers. To be moulded 3in. at heels, 2in. at turn of bilge and 1½in. at heads. Five frames in bow, and all abaft after end of waterline to be sided 2in.; two frames abreast of mainmast to be sided 2½in.; all other frames, twenty-four in all, to be sided 2¼in. The heels of all frames to be jogged into keel and deadwoods and securely bolted.

Floor Knees—On three frames, floor knees of 2¼in. by ⅜in. flat iron, properly galvanized, will be fitted. To each one of four frames amidship, two hackmatack or oak knees, sided 2in., will be fitted; one forward of frame on starboard side, and the other aft of frame on port side, the space between the heels of frames and the two knees to be filled with an oak chock to take main keelbolt. The lower arm of knee to extend across the keel, the upper arm to extend not less than 2ft. up the side of the yacht. The knees to be thoroughly bolted to keel and to each other through timbers and oak chock, and also to timbers for full length of upper arm. On not less than seven of the remaining frames, solid floors of 2in. oak to be fitted, well bolted to timbers and horn timber.

Beam Clamps—Of clear yellow pine, in single lengths, 6in. by 1½in. amidships, tapering to 4½ by 1⅛in. at ends,

to be fitted close up to planksheer; the ends well bolted to stem and quarter timber. The deck beams will be jogged into these clamps.

Bilge Clamps—One bilge clamp of clear, yellow pine, 4in. by 1½in. amidship, tapering to 3in. by 1⅛in. at ends, to be run about at turn of bilge on each side; to be in single length, the ends well fastened to stem and horn timber.

DECK FRAME.

Deck Beams—Of hackmatack or oak, moulded 2in. Two beams at mast, one at fore end of house, and one at after end, to be sided 2¼in.; all others to be sided 1¾in. Beams to be jogged down into beam clamp, and all half beams to be tenoned into carlins; with one brass knee 2in. by 1½in. by ⅛in. to each beam. All beams spaced 12in.

Hanging Knees—Of hackmatack or oak, sided 1¾in., three on each side; one abreast mast, one at fore end, and one at after end of trunk.

Lodging Knees—Of hackmatack or oak, sided 1¾in., three on each side; one at mast, one at fore end and one at after end of trunk.

Breasthook and Partners—A solid filling of hackmatack or yellow pine to be fitted under deck, to be 2in. thick and 12in. wide, extending from inside of stem to deck beam next abaft mast; to be well bolted to stem, beams and clamps.

Carlins—To be of clear white oak, 4in. by 2in., and of full length of trunk and cockpit, about 22ft. All half beams to be tenoned into carlins and secured with brass knee, as before provided.

Planksheer—To be of clear white oak, in single lengths, 4½in. wide and 1¼in. thick. To be fastened to sheerstrake and clamp with brass screws, 3in. by ¼in.

Partner Planks—Of mahogany, 1¼in. thick; the forward one 12in. wide and the after one 8in.; to be fastened to deck beams with brass screws, 2½in. by ¼in.

PLANKING AND DECKING.

Planking—To be sawn 1¼in. full, to finish as near that thickness as possible. All planks to be in single lengths, unless otherwise directed by owner or agent. Butts, if found necessary, to be at least four frames apart in adjoining strakes; and if on the same frame, to be separated by not less than three strakes. The butts and garboards to be especially well fastened. All seams to be close on inside, with full 1-16in. opening outside for caulking. The entire outside of hull to be carefully planed off.

Garboards—To be of white oak, in single lengths.

Bottom Plank—To be of cypress, free from loose knots, sap and shakes, up to the waterline amidship.

Wales and Topsides—To be of clear yellow pine, free from pitch and knots, to work not more than 4in. wide.

Deck—To be of clear white pine, dry and free from knots, sap and shakes; all in single lengths, and at least 1¼in. by 1¼in.; laid straight fore and aft, with ends stepped into planksheer and properly supported and fastened.

Seams—Of planking and deck to show tight on the inside and 1-16in. opening on the outside for caulking.

DECK JOINERWORK.

Bulwarks—Of clear yellow pine 1⅛in. thick, 4in. high forward, 3in. amidship, tapering out aft. Four neat scuppers on each side.

Rails—Of clear white oak in single lengths, 1in. thick and 2¼in. wide.

Cabin Trunk—To be of selected mahogany, 1½in. thick, about 12in. high and in one length, about 16ft. The top to be of mahogany, 1in. thick and 3in. wide, tongued and grooved and laid in varnish. The beams of cabin trunk to be sided 2in., moulded 1½in., and spaced 12in. Three brass hinged deck lights, of as large size as possible, to be fitted in each side of trunk.

Skylight—To be a single sash, 2ft. long and 3ft. wide, hinged; glass to be ¼in. thick, protected by brass rods.

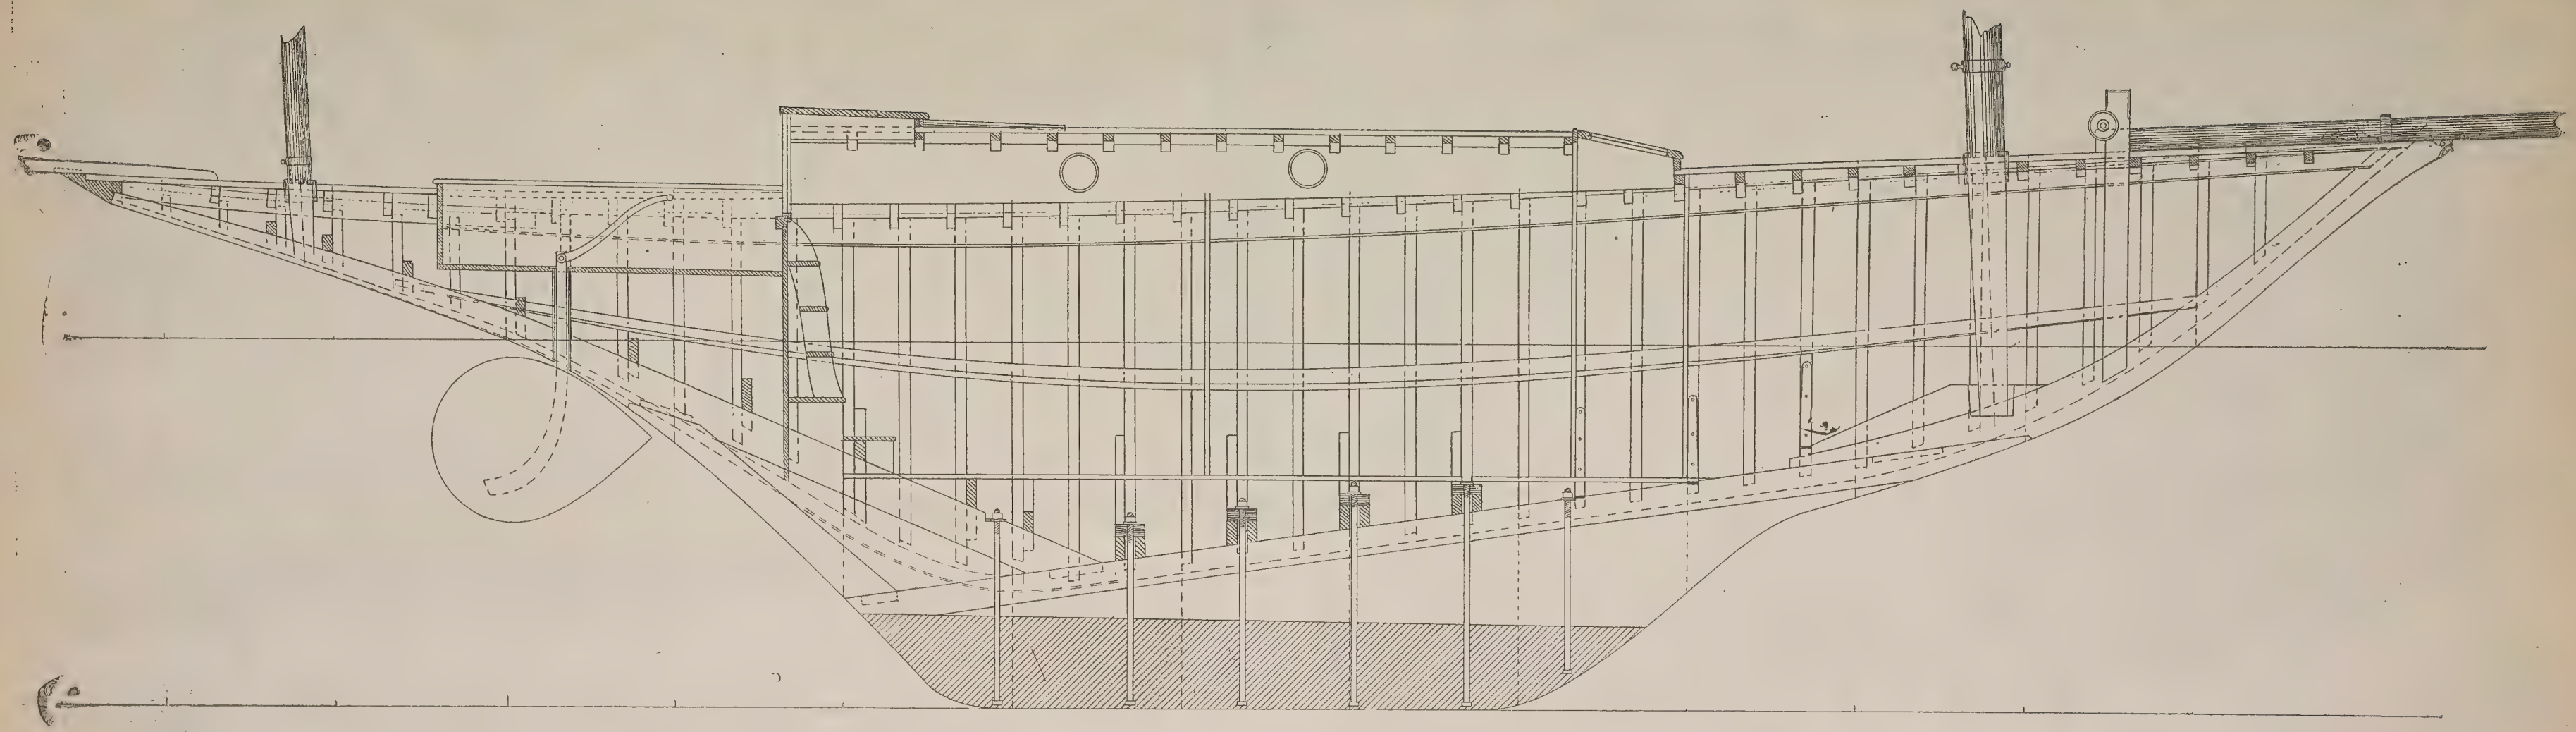
Companion—Slide and doors of mahogany, the latter paneled.

Fore Hatch—To have opening 18in. by 15in. in clear, coamings of 1½in. mahogany, with hinged top.

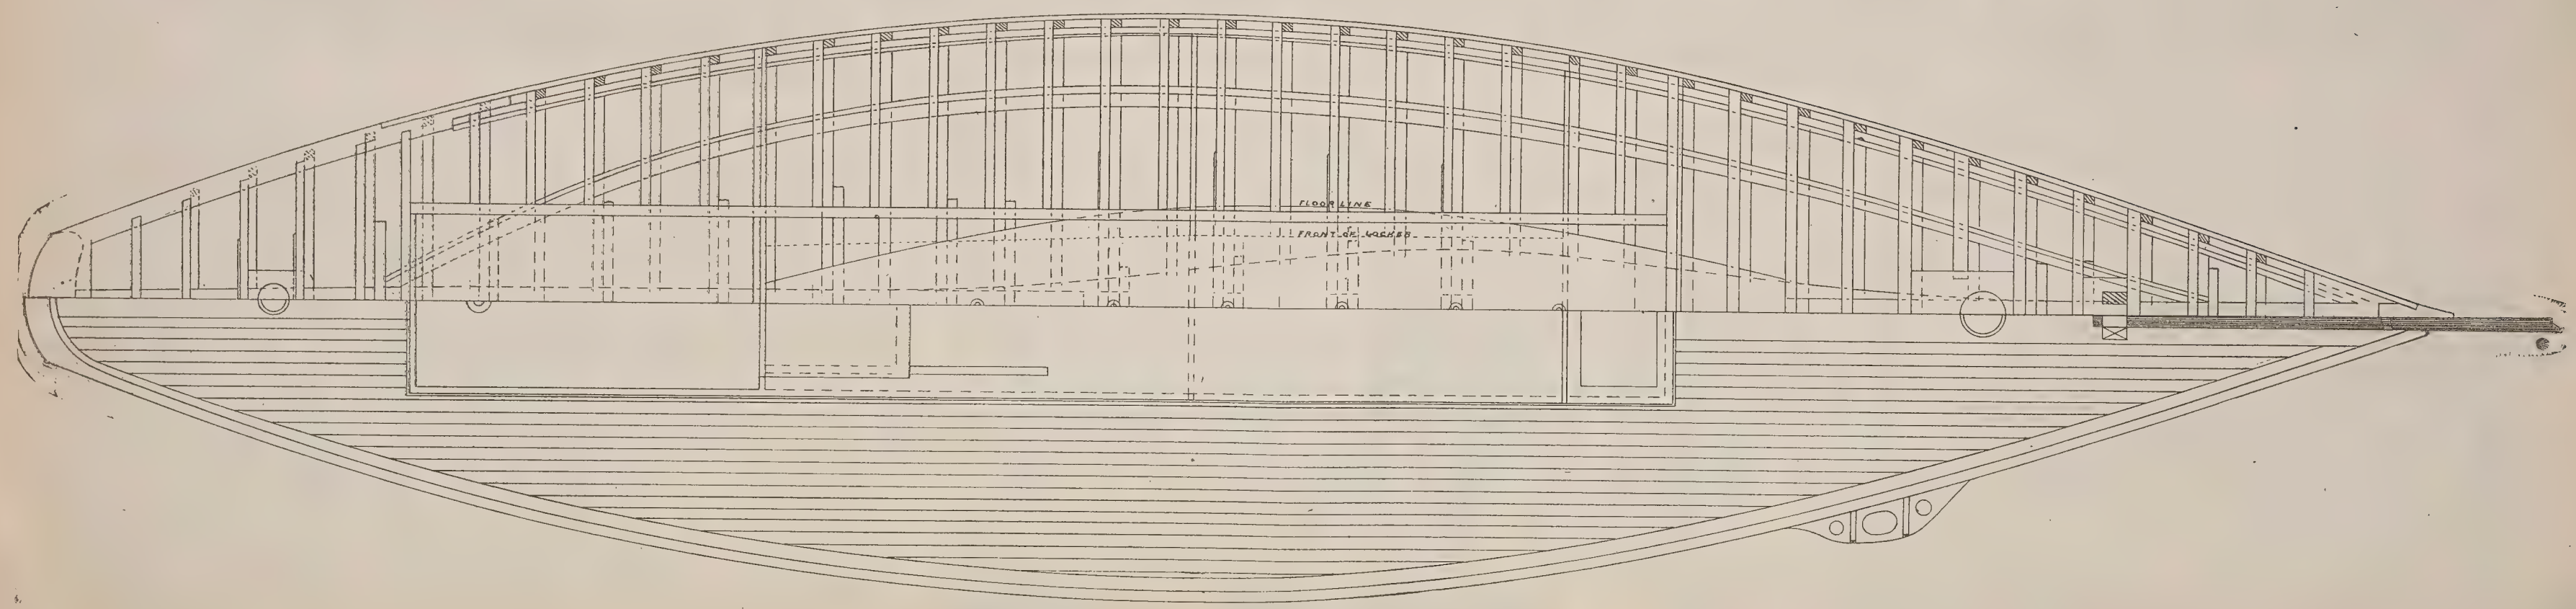
Cockpit—To be floored with same material as deck; to be staved up with ¾in. by 3in. mahogany, edges chamfered, all joints to be laid in varnish. The staving to be gained into a mahogany coaming on floor, to make the cockpit thoroughly water tight. To finish on deck with a mahogany rail 6in. wide, raised 1in. above deck.

Bitts—To be of sound locust, about 3in. by 5in., the heels securely bolted to stem.

Cleats—The necessary cleats to be of sound locust or mahogany. One quarter post 2½in. by 2½in. to be fitted on each side for main sheet.



FASTENINGS.



Keel Bolts—Of best quality of Tobin bronze, with good heads and standard nuts and washers. Center line bolts, six in all, to be 1⅛in. diameter; diagonal bolts, six in all, to be ¾in. diameter.

Blunt Bolts—All deadwood, keel and frame bolts to be of yellow metal or other approved alloy, properly headed, over washers of same metal. Stem, keel, horn timber and deadwoods to have ½in. bolts; heels of frames to be through-fastened with one ⅜in. bolt; floor knees and solid floors to be fastened to stem, keel and horn timber with two or three ⅜in. bolts, iron knees to have same; floors, heels of timber and oak chocks to have ⅜in. bolts. Beam and bilge clamps to have one 5-16in. through bolt and one 3in. yellow metal spike in each frame; bolts and spikes in opposite edges alternately. Deck beams to have one ¼in. bolt into beam clamp at each end. Hood ends of planking and all of garboards to be fastened with 3in. by ¼in. yellow metal spikes. All other plank fastenings to be stout copper boat nails, riveted over burrs. The bulwarks, where over 2in. wide, to be fastened with ¼in. bolts, spaced 15in. and driven diagonally into sheerstrake, the after ends being fastened with stout brass screws. Rail, planksheer and partners to be fastened with ¼in. brass screws. The deck plank to be blind-nailed to each beam with 2¾in. galvanized iron nails. All parts not specified to be well fastened in the usual manner. All plank fastenings to be set in for putty stops, and all fastenings about deck and trunk to have wooden deck plugs set in varnish. The sides of cabin trunk to be through-bolted to carlins with ¼in. yellow metal bolts.

INTERIOR JOINERWORK.

Floor—To be of ⅞in. worked ash or yellow pine, laid

AUDAX, YAWL, DESIGNED BY JOHN HYSLOP, ESQ., FOR HENRY W. EATON, ESQ., 1892.

in battened sections, fastened with brass screws.

Ladder—Of mahogany, with three steps, each with rubber tread.

METALWORK.

Lead Keel—To weigh about 12,000lbs., to be in one casting, soundly and accurately cast to shape and well smoothed up; and bolted to hull as described. The lead to be furnished by builder.

Rudder—To be of Tobin bronze, the stock to be 2in. diameter, forged on lower end as per drawings; the body of two 3-16in. plates, riveted together at edges and also riveted through stock, all rivet holes to be countersunk. The space between the plates to be filled with melted pitch, to keep out all water. A tube of ¼in. brass, of 2¼in. internal diameter, to be driven tightly through floor of cockpit, chock and horn timber; with brass plate in floor and brass bushing let into planking at lower end, as per drawing. The name Audax to be engraved on plate. A 3in. washer, and a casting for wooden tiller, the same to work on ¾in. Tobin bronze pin through head of rudder stock.

Chainplates—Four for main shrouds, of 2in. by ⅜in. steel; four for main runners, of 1½in. by ⅜in. steel, and two for mizzen shrouds, of 1½in. by ¼in. steel.

Channels—Of 3-16in. steel plates, shaped as per drawings and flanged to fit side of yacht. To have two braces of half-round iron, 1¼in. by ⅜in., riveted across top of channel, the outboard end of each to go through chainplate and be riveted up.

Gammon Iron—Of steel, 2in. by ⅜in., securely bolted to stem head.

Traveler—One for main sheet, of ¾in. steel, securely fastened to beam.

Davits—One pair of Mumm's patent davits, for yawl 4ft. 2in. beam.

All iron and steel to be of best quality, and neatly galvanized.

BRASSWORK.

Fittings for rudder, as specified, two leading chocks on bow, one for ⅜in. chain, two on taffrail, eyebolts and leaders for jib shets, screw deck plates for pump and water tank, fittings for skylight, hinges, hasp and lock for main companion and fore hatch, brass sockets for mast bitts and brass caps for main, mast and quarter bitts, six in all. Six hinged side lights for cabin trunk. Two bobstay plates for stem.

PLUMBING.

Water Closet—One small size water closet to be fitted to starboard, with all connections and sea cocks. One small wash basin with waste pipe connected to closet.

Pump—One single-barrel copper yacht's pump, 2½in. diameter, with 1¼in. suction pipe to well; galvanized iron spear and brass screw plate in deck.

Scuppers—Of 1in. lead pipe, fitted in cockpit floor, one on each side; to drain below waterline.

Water Tank—As large as space will permit, under cockpit, with filling pipe and screw plate in deck, and pipe to forecastle.

Pump—Small house pump for fresh water to be fitted in forecastle.

SPARS.

Bowsprit—Of spruce, 5in. diameter at gammon, 4¼in. at cranse and 15ft. long. All other spars to be furnished by owner; mast steps to be fitted for masts as furnished.

MISCELLANEOUS.

Limbers and Pump Well—Suitable limber holes to be cut in all knees and floors to lead to pump well. All small spaces between garboards and deadwood or keel to be filled flush with pitch, to lead all water to well.

Tiller—Of locust, fitted to brass yoke on rudder head; carving on fore end as per drawings.

Side Ladder—Of mahogany, with brass hook arms and rubber on steps.

Boom Crotch—Of oak, as per drawings.

Mast Bitts—Of locust, with brass sockets in deck and brass caps.

Capstan—To be provided by owner and fitted by builder.

Anchors, chains and all riggings to be provided by owner.

CAULKING AND PAYING.

All seams of planking to be properly caulked with cotton, run with paint and payed with putty. All seams of deck to be carefully caulked with cotton, using no oil nor grease on iron; and run with Jeffries' Marine Glue, according to directions furnished by maker. All nail and screw holes about deck to be filled with wooden plugs set in varnish; all other fastenings to have putty stops.

PAINTING.

Inside, below floor, to be painted with one coat of red lead and oil.

Bottom—To have two priming coats of red lead and oil, and one finishing coat of Ratjhen's Composition, smoothly applied.

Topsides—Up to rail, to have two priming coats, the first of red lead, both well rubbed down, and one finishing coat of best black, no oil to be used.

Varnishing—The rail, plankshеer, cabin trunk, cockpit and all deckwork except planks to have three coats of best spar composition, each coat being thoroughly dry before the next is laid on. The interior of cabin to have one coat of wood filler and two coats of best varnish.

Carving and Gilding—A ¾in. cove to be run in topside, with carved scrolls at bow and stern, all laid in best gold leaf. The name and port to be placed on stern in brass letters 3in. long, neatly gilded in best gold leaf.

SEPARATE SPECIFICATIONS FOR INTERIOR WORK.

Forecastle—Bulkhead of clear yellow pine, 3in. wide, matched with edges chamfered; with door of same opening on port side and finished to appear when shut as part of bulkhead. Stout brass hinges and brass spring catch to be fitted on forecastle side, and sunk flat brass bolt on after side. The forecastle to be fitted with plain pine locker, painted.

Toilet Room and Pantry—A second bulkhead to be built 2ft. abaft the first, with opening 2ft. 6in. wide, for curtain. A refrigerator, provided by owner, to be fitted by builder on port side. The starboard side to be fitted with yacht W. C., as provided, and wash basin, with seat, step and casing of yellow pine.

Stateroom—To have a berth on each side, 2ft. 6in. high and 6ft. 6in. long, with 2ft. 6in. space between fronts. Two large drawers under each berth, with fronts of ash, oak or mahogany. Half bulkhead at head of each berth, finished with pilasters and rail. All finish of berths and bulkheads to be of yellow pine.

Saloon—To be 7ft. 6in. long, with sofa locker on each side, 2ft. 6in. between fronts at fore end, narrowing to 2ft. aft. Front of lockers to be staved with yellow pine, edges chamfered, with ledge 2in. high. The back of each locker to be staved up for a height of about 12in., as per drawings, with cap on staving. After bulkhead of yellow pine, with door on each side to locker at side of cockpit; these doors to have open lattice fronts of pine 1in. wide and ⅛in. thick. Doors to have brass hinges and spring latches.

Ceiling—From forecastle bulkhead to after end of saloon, the space above lockers to be ceiled with ¼in. cedar, finished smooth to receive lincrusta. Interior, except forecastle lockers, to be finished in varnish, as provided.

George L. Watson.

We are indebted to the Scottish Field for the following interesting biographical notice of Mr. George L. Watson, the noted yacht designer, who is quite as well known on this side as at home. We regret that it is impossible to reproduce the portrait accompanying the article:

Distant Shore, by Hermit, out of Land's End, by Trumpeter, out of Far Away, by Young Melbourne, is the name of the beautiful mare which was bred by Her Majesty the Queen, at Bushey Park, in 1880, and became the founder of the celebrated Hardwick Hall stud of Mr. C. D. Rose. In a few days it will be the name of Mr. Rose's new cutter yacht to be launched at Meadowside, Partick. Whether the newest of Watson's designs will bring as much success as the grand dam of Cyleene, one of the best race horses in training, and whose dam was Distant Shore's daughter, Orcadia, by Isonomy, remains to be seen; but Meadowside and Watson and winning yachts have now been closely associated since the year 1875.

Dr. Watson, the designer's father, was well known in Glasgow in his day, not only as a skillful practitioner, but a scholar possessing rich literary tastes and sympathies, and numbering among his friends Thackeray and that genial editor of Punch, Shirley Brookes. His mother, Miss Burstall, was a daughter of Mr. Timothy Burstall, an inventor of considerable note, and rival of George Stephenson of "Rocket" renown. On Dr. Watson's death, which sad event took place when the family were very young, Mrs. Watson, who is still alive and well, took up her residence in London, Mr. G. L., who had developed considerably the tastes of his maternal grandfather, and had determined on a career in the shipbuilding line, remaining in Glasgow. His brother, Mr. T. Malcolm Watson, had ideas the other way, preferring to draw houses to drawing ships; and his work as a dramatist is well remembered by those who used to enjoy so well the old German Reed entertainment and Corney Grain's songs.

Mr. Watson entered the practical work of life in the then famous yard of R. Napier & Son, of Govan and Lancefield, as a draftsman, in the year 1867, he then being sixteen years old, having come into the world with the America Cup in 1851. The head of Napier's yard was then Mr. Pearce, from Chatham, formerly alluded to as "Billy Pearce," subsequently to be known to posterity as Sir William Pearce, Baronet, of Fairfield, and the greatest shipbuilder of the nineteenth century. His fight to cut down the transatlantic records from seven and a half days to five and a half days, and to reduce the Australian and Eastern passages in equal proportion, is practically the romantic portion of the history of modern steam navigation. When many have been calling out about the late arrivals of transports they should think that but for Pearce, of Fairfield, who shortened Cape voyages five days, some of our troops would not yet be in Durban. It is to be regretted that he did not live to see Fairfield's greatest triumph, Kildonan Castle.

On leaving Napier's yard, where his training was of the most practical character, Mr. Watson went to Messrs. A. & J. Inglis, and it was there he first began to develop his ideas on yacht building. Mr. John Inglis was then an enthusiastic yachtsman, and Mr. Watson candidly acknowledges to many little things he learned in yacht designing at Pointhouse. In 1871 he designed his first yacht, the little rambowed, shallow-bodied Peg Woffington, on lines which were thought conducive to speed; but in this he was disappointed, and it was not till four years afterward (1875) that he produced the 5-tonner Clotilde for an Irish gentleman. This little craft, broken up at Kingstown but the other day, was the harbinger of his reputation. She was, to put it mildly, very considerably "rockered," and her appearance on the stocks recalled the anecdote in pre-historic Clyde yacht racing when a young Viking explorer was informed by his Norse king that he might have all the land he could circumnavigate south of Crinan Bay. Discovering when storm-stayed in West Tarbet, the narrow neck of land which separates Loch Fyne from the Atlantic, that astute Norseman went home, remained quiet, stowed away a set of wheels, and by the aid of his primitive patent slip—the Campbells having not come then—added Cantyre to the contents of his plate-locker. Notwithstanding all this criticism when Clotilde came out late in the season at Millport regatta in a stiff breeze and lumpy sea, carrying a whole mainsail against the then invincible Fairlie 5-tonner Pearl, which had to single-reef, she beat the latter handsomely. As she was built to Dublin Bay measurement, an objection to her as being half a ton in excess was sustained. Her designer and friends had, however, tasted the sweets of victory, and wished for more. "La Keel la Mortis, doun gangs anither keel" is the motto of Clyde shipbuilders, and the keel of Clotilde's successor was laid in the corner of Meadowside yard not far from the cradle of Distant Shore. The three owners, Mr. John Laurence, Mr. J. B. Hilliard, and her designer, with the assistance of two carpenters, put her together in such a tough fashion as to make growl the men who picked her to pieces two years ago. Round-bodied, with a big sectional area, and a keel of outside lead, Vril proved herself the best 5-tonner on Clyde of her year, though William Fife, Jr., in his first essays, Camellia and Clio, supplied tough opponents, getting races in their own weather. Vril was considered to be pretty big in her sail-spread for a then 5-tonner, and the writer, who took the place of third man with Messrs. Laurence and Hilliard, in the absence of her designer, in the three-handed Royal Clyde Corinthian match coming across Loch Long, thought she was a pretty good handful for five. Still with spinaker over her nose, we drew the winning gun. After the successes of Vril came the long unbroken line of Verve, Quiraing, Madge and Verve II. of 10-tonners, with the famous steel first-class cutter Vanduara. May, Marjorie, Yarana, Thistle, with three Valkyries, not to speak of His Royal Highness the Prince of Wales' Britannia, have followed, and but a month or two ago Mr. Watson received from one of the staunchest supporters of the pastime we have, the Kaiser himself, one of the kindest messages relative to the victory of Meteor as a yawl, accompanied by a bronze bust of her Imperial owner. Distant Shore, the latest of Mr. Watson's triumphs, will not challenge for the America Cup, being much smaller than the class of boats engaged in that seemingly endless enterprise. In regard to a fourth Watson representative for this contest, it seems unlikely that such will be seen under a racing flag for some time at least, as the designing, building, and preparing of such a vessel involves such exclusive attention as to preclude all other work, and as Mr. Watson had generally a fair share of this on hand for other clients, one or other would have to be neglected. In regard to this, we note from that treasury of useful yachting knowledge Lloyd's Green Book, that Mr. Watson has, in the twenty-five years he has been in business, designed some 32,000 tons of yachts, steam and sailing, representing probably a cash value of something like three-quarters of a million—a very respectable addition to the value of our pleasure navy.

As is well known, Mr. Watson believes in building boats which are smart in turning to windward, the windward road being the long road and the hard road of sailing. The idea is very old in yachting, as may be gathered from the following, from the Edinburgh Advertiser, Sept. 28, 1773:

"Yesterday the Earl of Ferrers, Admiral of the Fleet, arrived in his yacht after a cruise of about three weeks, which he took in order to make a trial of his new method of constructing ships. We are informed that nothing that ever was built answered all purposes so well, as not only is she a surprising fast vessel, but carries her sail remarkably well, and has every good quality a vessel can possibly have in the utmost perfection, more particularly in a heavy head sea. 'What,' says our correspondent, 'is very extraordinary in this vessel is that in turning up to windward from the Downs to Blackwell (where she arrived on Sunday evening) she beat every vessel between three or four miles an hour right in the wind's eye, though there were at last 100 sail of vessels of different sorts coming up the river.'"

In regard to steam yachts, Mr. Watson has built many of the largest, finest and fastest afloat, the largest of these for American clients, comprising the Nahama, for the late Mr. Robert Goelet; the Mayflower for his brother, the late Ogden Goelet; Varuna, of 1,500 tons, for Mr. Eugene Higgins, and Margarita, 1,350 tons, for Mr. A. J. Drexel. The largest of all is now building in Denny's yard, Dumbarton, for that noted international yachtsman, Mr. James Gordon Bennett, of the New York Herald, and will be launched about mid-summer. She presents some striking peculiarities when compared with the boats mentioned, embodying, as she does, some of her owner's own particular notions—has a straight stem with mast just aft of a huge funnel, is turtle-decked forward with poop aft. The Denny workmanship considered, she will be a magnificent vessel, and will steam eighteen and a half knots.

Of the yacht owners and yachtsmen associated with Mr. Watson in his early days, that genial old gentleman, Mr. John Clark, of Vanduara and Wendur, has been dead for some years; but Mr. James Coats, of Madge and Marjorie, is still sailing as usual with Duncan as skipper, now in the Gleniffer schooner, the largest sailing yacht afloat. Mr. Wyllie, of the first Verve, sails Verve VI. with all the verve of Verve I. The Allan Brothers, owners of the three famous 5-tonners, Nora, Doris and Dora, have gone into steam. Mr. Hilliard steers commodore ships on regatta days, and tells old yachting yarns with a briny flavor. Mr. John Laurence is chief Lloyd Surveyor at Sunderland, a position his father before him had for many years, and Mr. Inglis, the designer of Hilda, Blanche and Moira, seems to be seeking material for another yachtsman's holiday in steering that hitherto difficult ship the North British Railway.

ROCKWOOD.

The Eastern Y. C. Challenge Cup.

The final conditions of the new Eastern Y. C. challenge cup for the 51ft. class have been published, practically as given some time since in the FOREST AND STREAM, and the cup will be ready for competition in the coming season. The Seawanhaka Corinthian Y. C. has sent out to its members the conditions of the cup, accompanied by the following circular:

The attention of members is invited to the accompanying circular, issued by the Eastern Y. C., of Boston, announcing the conditions to govern races for the Eastern challenge cup, which has been established by that club as a perpetual challenge cup, for competition between the New York, Seawanhaka Corinthian, Larchmont, Atlantic and Eastern yacht clubs.

It will be observed that the intention is to promote the development of yachts of moderate dimensions and cost, which, while possessing high speed, will also be useful for other than mere racing purposes. It seems to us that the objects for which this cup has been established deserve every encouragement from our club, and that competition for it will furnish one of the most interesting events of the yachting season.

If any member or members desire to build a challenger we shall be very glad to arrange for the issuance of a challenge by the club, and to co-operate in arranging the terms of the contest, and to render any other assistance in our power.

RACE COMMITTEE, S. C. Y. C.
By C. A. SHERMAN, Sec'y.
NEW YORK, Dec 7.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

The Seawanhaka Cup.

THE agreement between the Royal St. Lawrence Y. C., the present holder of the Seawanhaka international challenge cup, and the White Bear Y. C., for a match next summer, has been completed, and is now ready for the signatures of the officers of the two clubs. The text is as follows:

Agreement governing the match for the Seawanhaka international challenge cup for the season of 1900:

It is hereby mutually covenanted and agreed by and between the Royal St. Lawrence Y. C., of Montreal, Canada, and the White Bear Y. C., of St. Paul, that the following regulations shall govern the match to be sailed between the representative yachts of the said clubs during the season of 1900:

Article 1.—The courses shall consist of a triangular course, and a course to windward or leeward and return. Each leg of the triangular course shall be one and one-third nautical miles in length, and shall be sailed over three times, making a total of twelve miles. The course to windward or leeward and return shall have a total length of twelve nautical miles; each leg shall be, if possible, two nautical miles, and shall not be less than one nautical mile.

Article 2.—The match shall be awarded to the yacht winning three of five races.

The races shall be sailed alternately over the triangular and the windward or leeward and return courses.

The first race to be triangular or windward and return, as the winner of the toss may elect.

Article 3.—The races shall be sailed under the management of three judges; one shall be appointed by each club, and the two so appointed shall elect a third on or before July 1, 1900. They shall act as judges and timekeepers, shall direct laying out the courses, shall decide whether the contestants come within the prescribed measurements and scantling restrictions, and shall settle all disputes. The decision of a majority shall be final in all matters pertaining to the contest.

It shall be the duty of the judges to thoroughly check the scantling, and satisfy themselves by boring, inspections or other means, that the measurements are thoroughly up to specifications.

Article 4.—Each club shall name its representative yacht five days before the first race.

Article 5.—The start shall be a one-gun flying start, with a preparatory signal.

Article 6.—The races shall be sailed without time allowance.

Article 7.—Yachts must not exceed 25ft. racing length measured under the following rule: L.W.L., plus the square root of the sailing area, divided by two, equals the racing length. Yachts shall be measured without crew on board, but with a deadweight of 450lbs., which shall be carried amidships; approximately at the center of buoyancy during measurement. The sail area must not exceed 500 sq. ft., as determined in Article 8.

A yacht's draft of hull or keel shall not exceed 5ft., and with the centerboard down shall not exceed 6ft. Draft shall be determined when yachts are in trim for racing. Centerboards shall be so constructed that they can be wholly housed without leaving any projection below the hull or keel.

Article 8.—The factor of sail area used in determining racing length shall be ascertained by adding to the actual area of the mainsail, computed from its exact dimensions, the area of the fore triangle. The hoist of the mainsail, when measured, shall be plainly marked on the mast and its outer points on the boom and gaff or other spars, used to set the sail, and the sail shall not be set beyond these limiting points. The fore triangle shall be determined by the following factors: (1) The perpendicular shall be the perpendicular distance between the deck and a point on the forestay, where the line of the after leech of the jib intersects the forstay, above which the jib shall not be hoisted. (2) The base shall be the distance between the forward side of the mast at the deck and the point of intersection of the forestay with the bowsprit or hull.

Any jib, when set, must not extend beyond the upper and forward points above defined.

Sails shall be limited to mainsail, jibs and spinaker. The total area of the mainsail and fore triangle shall not exceed 500 sq. ft. The area of the spinaker measured as a triangle, whose base is the length of the spinaker boom measured from its outer end, when set to the center of the mast, and whose perpendicular is the distance from the deck at the fore side of the mast to the spinaker halyard block, shall not exceed twice the area of the fore triangle. All jibs and spinaker must be triangular sails, but they may have small clubs on the heads not exceeding ten per cent. of the base of the fore triangle.

Article 9.—The spinaker boom when used in carrying sail shall not be lashed to the bowsprit or stemhead.

Article 10.—Shifting ballast shall not be allowed. (Centerboards shall be considered as fixed ballast.)

Article 11.—No outrigger or other mechanical device for carrying live ballast outboard shall be allowed.

Article 12.—Centerboards shall not be loaded except to overcome flotation, but metal plates may be used under the following restrictions:

The centerboard may be of steel or iron plate, of practically uniform thickness, not over 3/8in. thick at any point, and not weighing over 350lbs.

The centerboard, if of bronze, brass or metal other than steel or iron, may not be over 3/8in. thick at any point; shall be of practically uniform thickness, and shall not weigh over 300lbs.

Article 13.—Yachts must sail throughout the series of races with the same amount of fixed ballast, and centerboards of practically the same weight as carried in the first race.

Article 14 A.—Yachts must be so constructed that on a cross section taken at any point, no part of the hull shall be sensibly below the center part of the hull exclusive of the false keel or skeg.

14 B.—The cockpit area must not be more than 40 per cent. of the area of the deck.

Article 15.—Yachts shall be constructed in accordance with the following restrictions:

1. The planking of hull shall not be less than 1/2in. thick at any point.

2. The frames or ribs shall be of oak, elm or other hard wood, and shall not be less than 1¼ sq. in. per lineal foot of length of vessel; they may, however, be spaced as desired. Example: Frames may be 1¼ x 1, spaced 12in. c. to c. or 5/8 x 1, spaced 6in. c. to c., or 5/8 x

3. The deck plank shall not be less than 1/2ft. thick if without covering, but where covered with canvas may be 3ft. 8in. thick. The deck beams shall not be less than 1½ sq. in. per lin. ft. of length. Example: Deck beams may be 1½ x 1, spaced 12in. c. to c., or 1½ x ½, spaced 6in. c. to c.

Internal bracing, floors, knees or other stiffening members shall not be included in the area of the frames or deck beams.

Article 16.—The total actual weight of the crew, including all clothes, personal apparel and belongings worn by them or carried on board during the race, shall not exceed 650lbs.

Article 17.—The helmsmen and crew shall be amateurs, and members of the respective clubs, and the helmsmen shall be named in writing, as required by the provisions of Article X. of the declaration of trust.

Article 18.—The provisions of the declaration of trust, so far as the same are inconsistent with the foregoing articles, are hereby waived, but in all other respects shall govern the match.

In witness whereof, said clubs have caused this agreement to be signed in duplicate by third duly authorized representatives this — day of ———, 1900.

ROYAL ST. LAWRENCE Y. C.,
WHITE BEAR Y. C.

YACHTING NEWS NOTES.

The Rochester Y. C. held its annual meeting on Dec. 7, electing the following officers: Com., Alfred G. Wright; Vice-Com., Charles Van Voorhis; Fleet Captain, Albert E. Vogt; Sec'y-Treas., Thomas G. Young; Cor. Sec'y, John F. Griffin; Meas., William H. Pillow; Fleet Surgeon, W. J. Herriman; Directors, F. E. Rogers and F. E. Woodworth; Delegates to L. Y. R. A., Charles Van Voorhis, J. E. Burroughs and J. W. Robbins; Alternates, T. B. Pritchard, Frank T. Christy and James C. Dryer.

The club, after the most successful season in its history, is in a very prosperous condition. After the meeting a banquet took place.

An adjourned meeting of the Lake Michigan Yachting Association on Dec. 9 was voted to add the 20ft. knockabout class of yachts to the boats eligible to compete in Association events. For some time there has been agitation in favor of the smaller boats, a class very popular throughout the East, and the present move is one in which yachtsmen all up and down the lake are interested. The Green Bay, Milwaukee, Chicago and Columbia yacht clubs were represented at the meeting. Messrs. Mather and Curtis were present from Milwaukee. W. R. Crawford and John B. Berryman represented the Chicago Y. C., and W. S. Bougher the Columbia fleet. Plans for next year were discussed, but no definite steps taken. It is probable a challenge cup will be offered for a series of events to be competed for by the new knockabout class. The annual regatta will probably be held about July 4.—Chicago Herald.

The Minnetonka Ice Y. C., to maintain a winter club house and fleet on the lake, has filed articles of incorporation with the Secretary of State. The officers are: Com., Theodore Wetmore; Vice-Com., Albert E. McMillan; Sec'y, Fred A. Hubbard; Treas., Robert G. Morison; Meas., William K. Morison.—Minneapolis Tribune.

Virginia, the new Watson steam yacht building at the Bath Iron Works for Isaac Stern, had a builder's trial on Dec. 14, a run of four houre. She will be completed in a short time, and will leave for New York. Capt. Leander Jeffries is in command.

The Old Mill Y. C. has elected the following officers: Com., Dr. G. A. Cooper; Vice-Com., August Dachtal; Rear-Com., Adam Glasita; Sec'y, M. Teed; Treas., L. Walker; Board of Trustees, David Van Winklen, F. Terry and J. F. Lee. The club elected thirty-three new members, increasing the membership to ninety-three. It was decided to limit the membership to 100, and dues were increased to $5. A new club house 50 x 100ft. will be ready by spring.

The Beverly Y. C. elected the following officers on Dec. 9: Com., G. H. Richards; Vice-Com., L. S. Dabney; Sec'y and Treas., Lawrence Whitcomb; Meas., John Parkinson; Regatta Committee, F. E. Cabot, C. F. Hodges, C. H. Jones, L. G. King, J. G. Palfrey, E. M. Farnsworth, R. V. Emmons, 2d; Admission Committee, F. L. Dabney, A. S. Hardy, F. W. Sargent, E. M. Farnsworth, Lawrence Whitcomb; House Committee, Dr. E. S. Wood, A. S. Hardy, W. H. Emmons, Lawrence Whitcomb, W. E. Eustis; Counsel, John Parkinson and C. H. Jones.

On Dec. 9 the following gentlemen gathered at the R. C. Y. club house, Toronto: Messrs. J. Wilton Morse, J. W. Rutherford, S. Playfair, E. Wedd, N. Darrell, H. Parsons, J. W. Barry, N. Bastedo, C. Crean, H. Lowden, C. Reid and T. Cuff. The purpose of the meeting was to form an association to be known as "the small boat section of the R. C. Y. C.," and to draft a constitution. It was also decided that the annual fee be $3, but only members in good standing with the R. C. Y. C. and prospective ones would be eligible to membership.

Mr. J. Wilton Morse, the chief organizer of the skiff section, laid the essential points of forming such an association before those present in a masterly style. He contended that for the past four or five years skiff sailing had been comparatively dead in the club and now the younger members felt that it was high time something should be done in a substantial way to again bring small boat racing up to the old standard. To do this, continued Mr. Morse, as an inducement for the junior members to build boats in the 16ft. class (the maximum cost to be $150, ready to sail), prizes worth while competing for should be hung up. The first it is intended shall be $30, second $20, and for third place $10. To raise the necessary prize money, for one race in each sailing month, viz., June, July, August and September, the sum of $300 is required, and it is proposed that the boat section itself raise $150, the balance being subscribed by the older members of the yacht club. The intended races shall be sailed over a triangular course, laid out in front of the city club house, with half-mile sides, six rounds to a race, so that the boats will pass the club house, thus enabling the spectators from the veranda to see the boats go by every few minutes. With the promise of five boats already in the class, concluded Mr. Morse, and the prospects of two or three more, there should be a grand revival of sailing, as has not been seen since the palmy days of '91 and '92.

The association then unanimously elected Mr. Henry Barber as chairman. This gentleman takes a lively interest in all the junior members, and he will see that the small boat section proves an exceptional success next summer.

The officers of the association for 1900 are: Mr. Henry Barber, Chairman; Mr. Nat Darrell, Hon. Sec'y-Treas.; Committee, Messrs. E. K. M. Wedd, R. T. Cuff and J. W. Morse.

A meeting of the club will be held on the second Saturday of each month, and it is hoped that as many as possible will make it convenient to attend.—Montreal Star.

The boats must conform to the limits of the special ballasted class of the Lake Sailing Skiff Association, as follows: They must carry at least 600lbs. of ballast, either in the form of a fixed keel, loaded centerboard, interior ballast or any combination. Weights of metal centerboard or steel fin to be included in this weight. Centerboards weighing over 200lbs. must not at any point draw more than 4ft.

They shall be measured with this amount of ballast and 300lbs. for weight of crew aboard, and must not exceed 4ft. draft, except in the case of centerboard boats, which shall be allowed to draw 6ft., provided the centerboard does not weigh more than 200lbs. The dimensions shall be:

Length over all not to exceed 25ft. 6in.
Length on waterline, 16ft.
Minimum beam, 6ft.
Minimum freeboard, 15in.
Sail area not to exceed 330 sq. ft.
Crew, two men.

Planking not less than 1/2in. thick. Ribs 1¼in. square to the foot, over at least two-thirds the over-all length of boat, with a reduction of 20 per cent. allowed in size of ribbing at the ends.

Rifle Range and Gallery.

Rifle at St. Louis.

ST. LOUIS, Mo.—The weekly medal shoot of the Excelsior Rifle Club was held at its headquarters, No. 5 North Broadway, over the 75ft. range, on a German ring target, 10 shots each man, possible 250 points. A meeting was held after the shoot and four new members were accepted, and it was agreed to have a shoot at 200yds. every Sunday at Farm Glen. This team will also take up revolver shooting at Capt. Schaaf's academy, at 20yds.:

Feb. 13-17.—Hot Springs, Ark.—Third annual midwinter tournament; $1,000 added; 2-cent targets (Rose system) and live birds (high guns). Capt. A. R. Smith, Sec'y.

April 2.—New York Vicinity.—Interstate Association's Grand American Handicap. Edward Banks, Sec'y.

April 18-21.—Lincoln, Neb.—Third annual amateur tournament of the Lincoln Gun Club. Live birds and targets. W. S. Stein, Sec'y.

May 7.—Chicago, Ill.—Twenty-sixth annual convention and tournament of the Illinois State Sportsmen's Association. W. B. Leffingwell, Sec'y.

June 3-8.—Utica, N. Y.—Forty-second annual tournament of the New York State Association for the Protection of Fish and Game. Henry L. Gates, Sec'y.

June 5-7.—Columbus, O.—Ohio Trapshooters' League tournament. J. C. Porterfield, Sec'y.

June 11.—New York Vicinity.—Interstate Association's Grand American Handicap target tournament. Edward Banks, Sec'y.

June 19-21.—Charleston, W. Va.—Fourth annual tournament of the West Virginia State Sportsmen's Association, under auspices of Beechwood Rod and Gun Club. Added money and merchandise prizes. J. A. Jones, Sec'y, Charleston, W. Va.

Aug. 28-30.—Arnold's Park, Okoboji Lake, Ia.—Budd-Gilbert tournament.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have printed. Ties on all events are considered as divided unless otherwise reported. Mail allsuch matter to Forest and Stream Publishing Company, 346 Broadway, New York.

The members of the Fountain Gun Club have received from the secretary notice as follows: "The Fountain Gun Club will hold a trap contest at Dexter Park on Thursday, Dec. 21, at 1 P. M. It is proposed to repeat the pleasant experience of last month, and to this end a parlor trolley car to the grounds and return will be

provided for members contributing to the expense. We can accommodate from fifteen to twenty persons besides the attendants in the car, and the expenses, including luncheon, will be from $2 to $2.50 for each person, depending upon the number present. Please inform me not later than Monday, Dec. 18, whether you wish to be one of the party. Car seats will be awarded in the order in which replies are received, and a letter will be sent to each subscriber advising when and where to take the car. We are compelled to limit the car accommodations to members and press representatives in view of the number of members who have already expressed a wish to be with us."

Dr. W. L. Gardiner, of San Antonio, Tex., who has been spending the summer in New York and vicinity, contemplates an early departure for Florida, where he will spend the winter enjoying the sports afield which there abound. Recently he purchased a pointer of Mr. E. R. Wilbur, Jr., of Fitchburg, Mass. This three-year-old dog has a pedigree which takes in most of the famous winners of America, and Dr. Gardiner is earnest in his praise of him both as to looks and performance. He avers that he is one of the best field dogs in America. Incidentally, he bought him through an advertisement in FOREST AND STREAM. This pointer will have a Florida experience this winter, as he is intended to do the finding and pointing essential to good shooting. Dr. Gardiner was recently elected a member of the Fountain Gun Club.

The Winchester Repeating Arms Co., New Haven, Conn., have issued their calendar for 1900. The uses of rifle and shotgun are illustrated by two large pictures, the work of the famous artist, Mr. A. B. Frost. The picture at the top of the calendar portrays a mountain hunting scene—two men lying concealed behind large rocks, keenly watching some mountain sheep in the distance. The title is "Waiting for a Shot at the Old Run." The picture at the bottom of the calendar portrays quail shooting. Two setter dogs, one pointing, the other backing, flushed birds, and a sportsman in the act of shooting, make a very spirited scene.

The calendar of the Peters Cartridge Co. for 1900 contains illustrations of the practical use of Peters ammunition at the traps, butts, and the shooting of big game, and upland and wildfowl shooting. There is an illustration of shooting big game in the Philippines, guinea hen shooting in Cuba, wildfowl shooting in Porto Rico and Hawaii, and a scene portraying big-game shooting in the West. It is entitled "Ammunition for our World-Wide Possessions." Address The Peters Cartridge Co., Cincinnati, O.; Eastern office, 80 Chambers street, New York; T. H. Keller, Agent.

The contest for the E C cup, emblematic of the championship at inanimate targets, was shot at Batavia, N. Y., on Monday of this week, and resulted in a victory for Mr. Fred Gilbert, the challenger, of Spirit Lake, Ia., by a score of 120 to Mr. W. R. Crosby's 119. The conditions were 50 targets at unknown angles, 50 expert, and 25 pairs. Unknown angles, Gilbert 46, Crosby 42. Expert, Gilbert 42, Crosby 40. Doubles, Gilbert 32, Crosby 37.

In the eighth monthly shoot for the Francotte gun, no one made the maximum of 50 points at the shoot of the Brooklyn Gun Club last Saturday. Dr. Creamer and Mr. Paterson were high with 49, each thereby scoring 9 to the good, and one short of the possible. The competition grows more interesting as the series progresses, and it is a matter of difficulty in a handicap of this kind to even make an intelligent guess as to the winner.

The Altoona Rod and Gun Club will hold a 15-live-bird race, handicap rise, on New Year's, Monday, Jan. 1, 1900, beginning at 9:30 o'clock sharp. Interstate Association rules will govern, and purse will be divided at 50, 30 and 20 per cent., class shooting; entrance $5, birds extra. Additional events to suit contestants. The club's commodious house and a warm lunch will be free to shooters throughout the day.

Under date of Dec. 15 Mr. Ed O. Bower, Secretary-Treasurer W. Va. S. S. Association, Sistersville, W. Va., writes us as follows: "On June 19-21, 1900, the West Virginia State Sportsmen's Association's fourth annual tournament will be held under the auspices of Beechwood Rod and Gun Club, Charleston, W. Va. Added money and merchandise prizes. J. A. Jones, Secretary, Box 736, Charleston, W. Va."

The Hudson Gun Club will hold one of its pleasant shoots on Jan. 1, commencing at 10 o'clock. Take Newark turnpike car to the Hackensack River bridge, at the terminus of the Pennsylvania R. R. ferry at Jersey City. A good hot lunch will be served to shooters. The grounds are pleasantly situated, there are two sets of traps, a comfortable club house, and good company.

On Bunn's grounds, Singac, N. J., Dec. 15, there was a match at 50 live birds between Messrs. T. W. Morfey and T. C. Wright. The birds were mixed in quality, though there were many good ones. The score was 36 to 33 in favor of Morfey. There was a straightaway wind blowing, which favored the birds. We are informed that the match was for $50 a side.

The Audubon Gun Club, of Buffalo, will hold holiday shoots on Christmas and New Year's days. The Christmas shoot commences at 2 o'clock. The New Year's shoot will be according to the regular programme, commencing at 10:30. The Clinton-Bidwell challenge trophy will be a feature of the shoots, and will be in open competition.

On Dec. 15 Mr. J. R. Malone, in a field of nine contestants, won the championship of Maryland and the District of Columbia, tieing with Hicks and Leland on 19 out of 20 live birds, and winning in the shoot-off at 5 birds, killing straight, while each of his rivals lost a bird. He was one of the scratch men, at 31yds.

There will be a match shoot, the Boiling Springs Gun Club against the Passaic City Gun Club, on the grounds of the former, Saturday afternoon, Dec. 23. Take Erie R. R. to Rutherford, N. J. The grounds are good, the company pleasant, and the shooting is sufficiently hard to test the skill of all.

The Busch medal was contested for early this month, between Messrs. J. J. Sumpter and A. D. Mermod, the latter the challenger. Each killed 24 out of the 25 live birds and therefore tied. The next effort to reach a conclusion will be some time later. The Sumpter-Smith match has been declared off.

There is quite a galaxy of the star gentlemen of the shooting world in town this week, among whom are Messrs. W. L. Colville (Dick Swiveller), Irby Bennett, J. Hildreth, J. J. Hallowell, B. Leroy Woodard, E. D. Fulford and E. C. Meyer, president of the Rochester Rod and Gun Club.

Drs. Carson and Miller, of Chicago, are enjoying a quail shoot in the southern part of Illinois, and thereby the Eureka Gun Club is minus one of its stanchest attendants at the club shoots.

In their match at 100 targets last week, at Jamaica, L. I., the scores were: R. Pfister 83, S. Van Allen 77. This was quite a bit below the usual capabilities of the two contestants.

On Jan. 1 the South Side Gun Club, of Newark, N. J., will hold its twenty-first annual all-day target shoot. Particulars can be obtained of Mr. C. W. Feigenspan, Newark, N. J.

Bad weather prevailed during John Wright's live-bird shoot last week, but his students turned out well, for when a shoot is on all weather looks alike to them.

The Interstate Association held a meeting on Thursday of this week in the rooms of the Sportsmen's Association, New York.

The Emerald Gun Club held an all-day shoot on Tuesday of this week at Dexter Park.

BERNARD WATERS.

ON LONG ISLAND.

Brooklyn Gun Club Open Sh° ot.

Dexter Park, Brooklyn, L. I., Dec. 12.—To-day witnessed one of the most interesting shoots ever held at Dexter Park from more than one point of view. To begin with, there were present an assemblage of the best wing shots in the world, viz.: T. W. Morfey, R. A. Welch, Capt. A. W. Money, Harold Money, his son; and although he never has won the Grand American Handicap he is sure to be heard from in this great shooting event before many years have passed.

This morning broke in a manner that would puzzle many a good weather prophet; while the sun showed himself in the east, yet the sky was hazy, and there was half a gale blowing from the southeast—just such a morning as the down East laymen would call ideal to go out and have a crack at the black ducks in the Great South Bay. However, there was a change at about 9:30 A. M. Rain began to fall in flurries, and by 10:30 A. M., the time scheduled for the shoot, it actually seemed as if Jupiter Pluvius (Jew-Peter Pluvius) was trying the best he knew how to get hunk on Manager Johnny Wright, of the Brooklyn Gun Club, and hoodoo him for once so that the shoot would not be the universal success that has crowned his efforts in all former enterprises of this kind. However, the boys that belong to the Brooklyn Gun Club are of the same stamp as the young fellow was who used to go and see his girl regularly once a week and had to walk through byways and side paths three miles long to see her. On one occasion asking her if next Sunday should be rainy what he should do, she said: "George, dear, you are not sugar and I am sure you will not melt." And so it is with the Brooklyn Gun Club boys: they responded nobly, and although it rained cats and dogs until after 1 P. M. those old veterans T. W. Morfey, Ed. Banks, C. W. Feigenspan, C. R. Wise and E. A. Thompson were on the grounds promptly at 10:30 A. M., as per schedule.

Prior to the regular shoot there were three miss-and-out contests decided. Taking the whole shoot together, the boys shot well and were always close up, Big Bill Hopkins, of the Aqueduct Club, doing the best execution with one barrel seen on the grounds during the day. The afternoon wound up with an exciting shoot between T. W. Morfey and Harold Money. These two nimrods have been dubbed the P. M. shooters. The only thing missing in their last shoot was a gasoline lamp on a pole to cap the climax, for they really shot so long that the birds could not be seen at all, let alone the traps. A good suggestion was made by several of the shooters that Lebohner ought to have the sign over his door changfied, and announce that in the future he would have coon as well as pigeon shooting on his grounds.

Following are the scores:

UNCLE DUDLEY.

Brooklyn Gun Club.

Brooklyn, Dec. 16.—For the first time in many months Manager J. S. Wright, of the B. G. C., failed on account of sickness to put in an appearance at the club's monthly shoot. Geo. Paterson took his place, and the shoot was run off without a hitch.

Event No. 5 was at 50 targets, with handicap, being the eighth monthly shoot in the gun contest.

Event No. 6 was prize shoot for cut-glass decanter, won by Dr. Webber.

Event No. 7, prize shoot for a pair of live ducks weighing 20lbs. They were won by Dr. Creamer, being the only heavy-weight in the crowd that could carry them home.

G. B. PATERSON.

Erie Gun Club.

Brooklyn, N. Y., Dec. 13.—Twelve members of the Erie Gun Club were present at Dexter Park to-day to take part in the last shoot of the season. The weather was bright and clear, and the birds flew well. Chas. Plate, in Class AA, and C. M. Tiffany, in Class B, were the only members to make clean scores. Chas. Plate and H. Dohrman were tied for first prize in Class AA on the season's shooting, and in the shoot-off at 10 birds, Plate won by 1 bird, Dohrman capturing the special prize in this class. In Class A Geo Fuchs won first prize and M. Alsasser won the special prize; Class B, H. Janowsky won first and B. H. Plate won special; Class C, prize for attending greatest number of shoots during year, won by R. Meader, John Murphy winning the other prize in this class. The scores:

Class AA.

Chas Plate, 28	1111111—7	F Gref, 28	1212002—5

UNCLE DUDLEY.

Fulton Rod and Gun Club.

Brooklyn, N. Y., Dec. 11.—The return match between the Fulton Rod and Gun Club and the Oceanic Rod and Gun Club was shot to-day on the grounds of the former, at the Old Mill. The previous match was shot on the Oceanic's grounds, at Rockaway Park, on Nov. 27, on which occasion the Oceanics won the match by a score of 117 to 81. The teams were then composed of seven men each and each man shot at 25 targets. To-day there were thirteen men to a team, 25 targets per man. "The Cuckoos" again carried off the victory, this time by a score of 208 to 180. In the match at 100 targets between Richard Pfister and S. M. Van Allen, the former won by 6 targets, Van Allen shooting away off his regular form. The weather was cloudy and mild, and there was not much wind. The attendance of shooters was good, no less than thirty-four men shooting in the sweeps. The scores of all the events follow:

Team race, 25 targets per man.

Unknown Gun Club.

Dexter Park, Brooklyn, Dec. 14.—At the regular shoot of the Unknown Gun Club, held here this afternoon, only eight men shot the regular score of 7 birds. The birds were good and strong, and made the boys shoot, W. A. Sands and Isaac Hyde being the only two to make clean scores. The scores follow:

W A Sands, 25	2222222—7	H Boemermann, 25	1111110—6
I Hyde, 25	1212111—7	M Chichester, 25	1210102—5
J Henry, 25	2101211—6	E Hauff, 25	0011112—5
H Knebel, 25	1011112—6	J Athurst, 25	0001201—3

UNCLE DUDLEY.

Allentown Rod and Gun Club.

ALLENTOWN, Pa.—The monthly shoot of the Allentown Rod and Gun Club was held Dec. 12 on the grounds, at Griesemersville. The attendance was large.

The scores in the medal event, 25 targets, were: John Goundie 19, R. Fink 13, A. Desch 15, Knauss 13, Fogelman 19, Kid Benning 9. In the shoot-off for the highest score John Goundie won and was awarded the gold medal. Albert Desch was given the silver medal.

John F. Weiler Gun Club.

ALLENTOWN, Pa.—C. F. Kramlich won the gold medal and Milton Brey got the silver medal at the monthly shoot of the John F. Weiler Gun Club, at the Duck Farm. The scores were: C. L. Straub 16, C. Hohe 13, O. H. Acker 7, M. Brey 19, C. F. Kramlich 24, J. Moran 13.

The scores in the live bird contest were:

No. 1: J. F. Weiler 6, O. H. Acker 6, C. L. Straub 8, O. Engleman 7, M. Brey 10.

No. 2: C. L. Straub 2, O. H. Acker 3, J. F. Weiler 5, A. Griesemer 3, C. Hohe 4, O. Engleman 2, M. Brey 6.

Florists' Gun Club.

WISSINOMING, Pa., Dec. 12.—The second of the series of four prize shoots of the Florists' Gun Club, of Philadelphia, was held here to-day. The weather was clear and windy, and the targets were thrown hard. The conditions of the event are 25 targets, known angles; 25, unknown angles; handicap allowance. Park, Barrett and Bell each scored 3 points; Wescott and Harris, 2 each, and McKaraher 1 point. In the team race following the prize shoot Redifer's team beat Park's team by 2 targets. The scores:

Park, 7	1111111101111111111111111 1011101111111101011011—44— 7—50

Team race:

Parks' Team—Parks 24, Harris 19, West 19, Bell 13—75.

Redifer's Team—Redifer 23, Smith 21, Butts 18, McKaraher 15—77.

Schuler Live-Bird Trophy.

CINCINNATI, O., Dec. 8.—The scores of the first contest for the Schuler live-bird trophy, which takes place the first Wednesday in each month, except July and August, follow herewith.

There are ten contests, the shooter having the seven best scores to be the final owner. Ties are shot off each month, as the winner at each contest is entitled to wear the trophy one month.

Hill, 30	121112212111221—15	Ackley, 27	0111112102111*1—12
Burton, 29	222222122222212—15	Maynard, 28	222122220100121—12

Burton, 29	22022—4	02212—4	11222—5

John Watson's Live-Bird Tournament.

CHICAGO, Dec. 12.—As was predicted at the time of the announcement, John Watson's live-bird shoot is proving not only a very pleasant affair but a very considerable shoot. We have come to look upon these winter annuals of Mr. Watson's as a very decisive bit of shooting history. It is then that the best of our live-bird shots come together from all over the West to try conclusions, and it is very often the case that, like a pack of good running hounds, they fall out among themselves and are obliged to resort to individual contests in order to clear up their own minds in regard to their relative shooting ability. A winter shoot at Watson's has greater news interest than a chance tournament of equal or greater size at other places or times.

The attendance to-day was perhaps not as large as we shall yet see it, but it was big enough to make a very pleasant and successful live-bird meeting. The biggest live-bird shoots are by no means the best or the most pleasant to attend. To-day there were plenty of men to keep both sets of traps moving, and the programme was nicely concluded in ample time in the evening, something like 1,100 birds being shot off. The top entry of the day was twenty-five.

The weather to-day was a good sample of Chicago's misfit climate. We had our first snow this week, and to-day the wind was raw and chilly, blowing to the left quarter from the score. Rain or snow threatened and the light was not too good. The birds turned out very fast, and straights were not common by any means, as witness the fact that there were only three straights in a 7-bird sweep, only five in a 10-bird sweep, and four in a 15-bird sweep, the latter out of an entry of twenty-five.

The good ones came from all over the country and set each other a very merry pace. Heikes, Gilbert and Budd were the first three men entered in the second event, and they each went out with 10. Next to them in the entry was another old-timer—Grimm. Dr. Carver was on hand also, and was among the straights in one of the events, though less fortunate in others. Col. Courtney was doing a substantial business, and Jack U. M. C. Hallowell was on hand with the somewhat erratic work of 10 straight in one event and 9 out of 15 in another. Tramp Irwin shot in very good shape indeed, going straight in the 10 and 15 bird events and missing only one bird in another 10-bird event—certainly a very good record for the grounds. Gilbert shot very consistently. Eddie Bingham was another of the trade contingent, and as usual was in the first running. Hirshey toward the close of the day found the birds, and killed 10 straight, though in the second shoot he managed to land only 5 out of his 10. Emil Werk, of the Sportsmen's Review, of Cincinnati, made a very good representative of sporting journalism, and got inside of the money part of the time. Elmer Neal came up from Bloomington, Ind., to mix with the boys in the sport of which he is so fond. G. T. Hall, of Loami, Ill., the 6ft. giant who used to shoot matches with Capt. Bogardus, was on hand and showed that he has not forgotten how to handle a gun. W. H. Harbaugh came up from Geneseo, and Tom Laflin, of Milan, Ill., promises to be on deck to-morrow. Among the local men are Kuss and Dr. Shaw, of the Garfield Club; George Roll, of Blue Island; Wilcox, of Audubon Gun Club; H. B., a prominent man, whose name is sometimes seen in other forms in shooting columns; Joe Barto, of the Alpine Gun Club; Lem Willard, of South Chicago, etc. Another distinguished guest is Harry W. Lee, the Alaskan hunter and explorer, the story of whose wanderings in Alaska was printed last winter in the FOREST AND STREAM. Mr. Lee now claims Chicago as his home, and he is just back this fall from a second Alaska trip, of which I hope we shall hear later. He shot a rattling gait to-day, killing 25 straight.

Throughout the day the shooting went on pleasantly and steadily, with the smoothness of the Watson system, and all the arrangements at the grounds were satisfactory, as they always are. George Watson acted as cashier, and handed out the money promptly to the boys, all except what his daddy thought was about right to hold out for pay for the J. Watson pigeons. Ike Watson and his friend Porter took care of the Fulford traps at No. 2 score. The dogs were in good shape for retrieving, and everything went very methodically. For the shooters nobody got very rich, but a good many got into the money, as will be seen from the scores which follow:

First Day, Dec. 12.

No. 1:

R O Heikes	2220212—6	C Grimm	2222202—6
H E Lee	1212100—5	E Bingham	2002211—5
Geo Roll	2202212—6	Hirshey	1001122—5
J M Healey	2122102—6	E Werk	2212022—6
R Kuss	2221202—6	L Willard	2112122—7

Kuss	0212112221— 9	Healey	2111212222—10

Neal, Carver, Budd, Hallowell, Hirshey, Gilbert, Bingham, Roll, Irwin, Graham, Hall and Healey divided $54. H. B., Heikes, Kuss and Courtney divided $42. Werk, Zimmerman and Willard divided $24.

Second Day, Dec. 13.

The weather had turned cold and a light covering of snow had whitened the landscape, making a trying background for the light-colored birds. The wind still made out to the left quarter, and the birds were even harder than they were yesterday. Shooting was concluded about half-past four in the afternoon, after a very steady day of pleasant occupation. More of the local men turned out to-day, though the Chicago contingent was none too numerous. Dr. Kibbey, of Marshalltown, Ia., joined the ranks to-day, and W. A. Porter, of Rock Island, continued his good and steady work. Tom Marshall, of Keithsburg, arrived and filled a long-felt want. In the first event the boys seemed to have solved the curves of the birds pretty well, for out of twenty-five entries fourteen of them went straight in the 7-bird sweep. This paid each man $7.40.

In the second event there were again twenty-five entries, and the shooting seemed to have taken a brace, for Courtney, Gilbert, Heikes, Bingham, Dr. Kibbey, Graham, Roll, Porter and Zimmerman all went straight, dividing $75. In the hole next to them were eleven others, who divided $50.

The third sweep at 15 birds turned out to be a pretty big affair, there being thirty-six entries, and the shooting taking most of the afternoon. In the 15-hole were Hallowell, Willard, Budd, Dr. Shaw and White, each of whom took down $22.65. The 14-men were Neal, Hirshey, Heikes, Dr. Kibbey, Roll, Tom Marshall, H. B. Odell, Hall, Irwin, Barto, Paterson, N. L. Hoyt, Argraves, Leffingwell, Von Lengerke and Porter. With this aggregation each man drew but $5.15. The 13-hole paid $7.20.

It seems likely that we are to have some cold weather now, and to-morrow will, in all probability, prove cold, a continuance of the very good live-bird weather we had to-day. The entry ought to hold up pretty well to what it was to-day, and on Friday we shall have the big event of the week, the annual battle of the giants which John Watson inaugurated some time ago, and which is looked forward to as a sort of clearing house settlement for the close of each year in Western live-bird shooting. This winter live-bird competition among the good ones reminds one of the habit which the bears have of standing up and marking their height on some tree in the woods. One bear stands up and puts his mark up so high he is pretty sure it will not be beaten. He thinks he is a good deal of a bear until some other comes along and scratches his record a little bit higher up the tree. Thus it goes, the big bears perhaps growing or shrinking a little bit from year to year, but all of them hoping that they can outreach the others. John Watson has set up in this annual event of his a sort of marking pole against which the big bears of the shooters can come and measure up. There have been some pretty tall scratches made on the old grounds before now, and we are apt to see some fun in the measurements next Friday, for most of the boys are feeling mighty sassy right now. Below are the scores of to-day:

No. 1:

Neal	2222222—7	Willard	2012200—4
Gilbert	2222222—7	England	2012221—6
Hirshey	2222220—6	Carver	2120222—6
H Odell	2211222—7	Harbaugh	2121120—6
Lee	0202012—4	Graham	2222222—7
Argraves	1112222—7	Heikes	2221212—7
Hall	1201212—6	Budd	2110110—5
Roll	2121122—7	Barto	2211222—7
Werk	2112212—7	Laflin	1121111—7
Courtney	2120211—6	Irwin	2112122—7
Zimmerman	2222212—7	Dr Kibbey	0211210—5
Hallowell	2221222—7	D Miller	1122002—5
Bingham	2222222—7		

Sevens divided; each got $7.40.

No. 2:

Neal	22*2222222— 9	Dr Kibbey	2121211121—10
Hirshey	2202122100— 7	H Odell	2202222222— 9

Odell	2222222220222222—14	J F Wolf	0222202202222222—12

The 15s divided $113.40, or $22.65 each. The 14s divided $88.20, or $5.15 each. The 13s divided $50, or $7.20 each.

Third Day, Dec. 14.

Snow continued to fall intermittently during the day, so heavily during the afternoon that the light was at times none too good, and the birds were confused by the storm. The birds to-day were not to be called extremely hard, though they were uneven, some very fast ones. It was by no means good flying weather, though the temperature was not unpleasant to the shooters. The wind was light, to the right quarter from the score.

Just before the beginning of his tournament Mr. John Watson received an injury from a fall, and he has been quite ill ever since. He came out to the grounds in a carriage on Tuesday, but has not appeared since then. It is to be hoped that he will be out by to-morrow, so that he may referee at the big handicap. Ed Steis refereed to-day at No. 1 score, J. L. Porter at No. 2 set.

It was rumored yesterday that Hon. James R. B. Van Cleave, of Springfield, would be on hand to-day with a team of shooters from the Illinois Gun Club, and it was proposed to shoot a team race next Saturday. To-day Mr. Van Cleave wired that the arrangements could not be completed and that he could not attend.

The top entry to-day was thirty-seven, and shooting was not completed until about 4:30. It was certainly a pretty warm shooting crowd, and a look at the scores will show that straights were far more numerous than any day during the week. Nobody made any money. It is a hard proposition when a man has to kill 15 straight at this park to get his entrance back. In the first sweep there were fourteen straights; in the second thirteen straights, and in the last shoot 10. On each day the programme is the same—event No. 1, 7 live birds, $5, high guns; event No. 2, 10 birds, $7, 60 and 40 per cent; event No. 3, 15 birds, $10, 45, 35 and 20 per cent.

On the three days' totals Gilbert is high average, and has missed but 3 birds out of 109 shot at, practice and all. On the first day he killed 45 straight; on the second 30 out of 32, and to-day 31 out of 32. Charlie Budd lost 2 birds to-day and Grimm lost 1. It is a singular fact that both Gilbert and Budd have been shooting borrowed guns all the week, their guns having been hung up in the Customs office at the Canada line, on their return from Tom Donley's shoot. Gilbert borrowed Jo Barto's Parker, and seems to take to it very kindly, while Budd has had very fair luck with John Watson's gun of the same make.

To-morrow is the day set for the big handicap, and it will need every working hour if the shoot is to be concluded to-morrow. A great many will enter for the handicap who have not shot during the week. It was learned this evening that forty-one shooters have already declared for this event, and it is almost certain that over fifty will go to the score to-morrow. My recollection is that there were fifty-nine entries last year. This insures a very heavy event, and I presume this is to be considered about as interesting as any live-bird contest we are apt to have this winter in the West.

Among the visitors to-day were Mrs. W. H. Shattuck, of Minneapolis, who was accompanied by her relatives, Mr. and Mrs. G. A. Leonard, of Fair Haven, Vt.; Messrs. Voris and Tripp represented Indianapolis; Arthur Gambell came up from Cincinnati; Capt. Eick came in from Sterling; Mr. Sperry swelled the Rock Island delegation; Woodford, of Springfield, came in, and Hirshey, of St. Paul, remains. Messrs. O'Brien and McCartney came over from Dubuque; Messrs. M. E. White and Roland, two husky railroad men, represent Milwaukee; Mr. E. K. Crothers, of Bloomington, shot under the name of Zimmerman; Mr. O. E. Searles came up from Minooka, and J. C. England from Mt. Pulaski. You could count the local men almost on one hand.

To-morrow will be a field day, and it is to be hoped that the storm will have stopped so that sharp flying weather will prevail. The following are the scores of to-day:

No. 1:

Neal	2212212—7	Budd	2211222—7
J R Graham	2222122—6	Bingham	2222222—7
Irwin	1221020—5	Tripp	2120221—6
Ed Voris	2221222—7	Heikes	2122121—7
Capt Eick	2112220—6	Werk	2122011—6
Woodford	2222222—7	Hirshey	2222222—7
Willard	2211222—7	Sperry	2011221—6
Hallowell	2222212—7	O'Brien	2222220—5
Searles	1112202—6	McCartney	2111022—6
Carver	2222222—7	Harbaugh	1112210—6
Gilbert	2222222—7	Roll	2221110—6
Grimm	2221222—7	England	2212122—7
Marshall	2222220—6	Parker	1221220—6

Neal, Graham, Voris, Woodford, Willard, Hallowell, Carver, Gilbert, Grimm, Budd, Bingham, Heikes, Hirshey and England divided $93.60.

No. 2:

Voris, Carver, Grimm, Bingham, Tripp, Budd, Graham, McCartney, England, Roland and Porter divided first, $116.55, or $10.59 each. Ties on 14 divided $90.65, or $6.97 each. Ties on 13 divided $51.80, or $5.75 each.

Fourth Day—Watson's Live-Bird Handicap.

Friday, the fourth and last day of the tournament, was an ideal winter day—clear, cold and bracing—and perfect for live-bird purposes. A light wind blew out to the right from the score. The birds averaged extraordinarily fast, as any one may see who will glance at the scores. Last year, out of fifty-nine entries in this same handicap, there was but one straight, Dr. Kibbey, of Marshalltown, Ia. This year, out of sixty-two entries, there was not a single straight! These same men go all over the country and make long runs, and to most of them it would seem that 25 straight would be well within reason. Yet they all come to Watson's and fall down when it comes to negotiating the Chicago brand, J. Watson live pigeon. Thus in the two years last past 171 trials have been made at making a straight in this event, and out of the 171 only one has succeeded. These records speak for themselves, and show why it is that Watson's Park is a graveyard for the reputations of our greatest shooting generals.

The shoot to-day was a big event, and very noteworthy in every particular, not only in the personnel of the shooters, but in the manner in which the event was conducted. John Watson himself, much to the regret of everybody, was unable to be present, but his two boys, George and Ike, the former at the cashier's desk and the latter at the scores, conducted the whole shoot with perfect satisfaction. George Watson is one of the most rapid men at this sort of work that we have in the country, and does about what two or three men are ordinarily expected to do in running cash. Everybody got his money when he wanted it, and there were no mistakes. The press was handled well. George Watson did the handicapping, and not a kick was heard. The totals speak loudly as to the justice of the marks given. The entire day was pleasant in every regard, and I imagine that few pleasanter have ever been passed by those who had come to visit Watson's historic park.

Shooting began at a quarter before 10 o'clock in the morning and was kept up steadily throughout the day at both sets of traps. It was 10 minutes after sundown when the last bird was shot, and the shades of night were gathering so fast that at times the birds could hardly be seen; indeed it is likely that the shoot could not have been concluded but for the white covering of snow, which gave a certain reflected light to the landscape. The last squad to shoot were Von Lengerke, H. B., Hicks, Boa, M. E. White and Palmer, and of these three missed their last birds, H. B.'s bird falling dead just across the wire.

As has been above indicated, there was no absolute winner of the handicap this year, and six men tied on 24. At 3 o'clock in the afternoon there were only three men who could make a possible straight. Charlie Grimm killed 23 birds straight, and on his 24th caught a hopper, which he missed with a snap shot of the right barrel. The bird lit on the ground, and Grimm missed it outright, shooting a little to one side. He was really the nearest of any to making a straight, though not the last to go out. Two squads below him was young Hirshey, of St. Paul, a slender, blond young fellow, well known in the West as a target shot, but of not so much experience in the live-bird game. He is a pleasant and very popular shooter. Hirshey was the last possibility for 25 out of the entire entry when his squad went to the score, and he had 6 birds yet to shoot. He killed his first bird on the string, but the bird following that, a white one, and not especially fast, which rose fairly high and swung to the left, he rather undercut with his first barrel, and missed with his second, so that he too joined the ranks of the 24s. Had he killed the bird it would have been worth $288 to him. Perhaps this very fact was what caused him to lose it. Hirschey had been shooting along and doing his best, and had not thought that there was more than $100 in first place—more than he had ever shot for before. Just as he was stepping to the score a certain young man representing a local sporting paper, stepped up to Hirshy with the glad information that it would be worth $288 for him to kill straight. The young man had just learned this at the box office and thought Mr. Hirschey might be glad to share the information with him at that time. Any shooter, even the oldest and steadiest, will understand the etiquettte of this, and will know the effect it is likely to produce in many cases, even with the most hardened veterans. The "gang" have their opinion of any attempt to break up a man when he is making a run, and there is an unwritten law among the rounders that this is not good form, and that it sometimes will cause a shooter to miss. Poor Hirschey felt rather badly, for he was centering his birds and stood to kill straight, as the hardest of the flying was over at that time of the day. At any rate, this is the way the last chance of a straight went glimmering. Thus the 21s were let in, and nobody got any money to speak of, 23 paying a little over $11, and anything below that about enough for cigars and car fare. The six men in the 24-hole drew $48 apiece.

There was no championship medal this year, the $100 added money taking the place of this. One very handsome souvenir was put up in quiet and unostentations manner. A certain old-time Western shooter being in hard luck was obliged to part with a fine silver water service, which he had won in earlier years as a trophy himself. This was shot for in the 15-bird event of yesterday, those competing for it putting up $2 extra, or $64 in all, which was sent to the former owner with the compliments of the boys. As there were a number of ties the final settlement was carried forward until to-day, and time growing short it was decided to draw lots for the ownership. Charlie Grimm asked Tom Marshall to draw for him, and Tom drew forth the winning number, so that Charlie takes home the silver set with him.

On the week's totals Fred Gilbert is high man, having missed but 5 birds out of 124 shot at, missing 2 to-day. Rolla Heikes has missed 8 birds out of the programme, and stands second. Neither Budd nor Gilbert has got his gun out of the Customs office, and Gilbert will need his when he meets Billy Crosby at Batavia next Monday.

Of the men who divided first place to-day, Hirschey is from St. Paul; Tripp from Indianapolis, Heikes from Dayton, Hall from Loami, Ill.; Grimm from Clear Lake, Ia., and Hallowell from Connecticut. Chicago had a fair representation in the 23-hole.

While it might have been more exciting to see a hotter finish, the conclusion of the handicap was satisfactory to those most concerned. A glance at the list of names will show some of the most prominent shooters in the Western country. Of these some came in to-day for the first time during the tournament, among others Mr. G. A. Mosher, of the Syracuse Arms Co., who was No. 1

in No. 1 squad, and who hence got out early in the day. Individual comment in so large a list of gentlemen would be invidious and out of place, and indeed the scores with the appended lists of names, residences, guns and ammunition will tell the story in very conclusive fashion.

Watson Park live-bird handicap, 25 birds, entrance $15; four moneys, class shooting; handicap 26 to 31yds.; $100 added money:

G. A. Mosher, of Syracuse, N. Y., used Syracuse gun, Du Pont powder and U. M. C. shells.

A. Gambell, of Cincinnati, O., used Lefevre gun, Du Pont powder and Leader shells.

G. T. Hall, of Loami, Ill., used L. C. Smith gun, E. C. powder and U. M. C. shells.

W. T. Irwin, of Chicago, Ill., used Parker gun, Laflin & Rand powder and Leader and Acme shells.

B. P. Woodford, of Dixon, Ill., used a Winchester pigeon gun, Du Pont powder and Leader shells.

Ed Voris, Crawfordsville, Ind., used L. C. Smith gun, Du Pont powder and Leader shells.

Capt. Eich, of Sterling, used L. C. Smith gun, Du Pont powder and U. M. C. shells.

Mrs. Shattuck, Minneapolis, used L. C. Smith gun, Du Pont powder and U. M. C. shells.

Dr. W. B. Kibbey, Marshall, Ia., used Parker gun, Du Pont powder, U. M. C. shells.

J. P. Graham, Windmere, Ill., used Parker gun, Du Pont powder and U. M. C. shells.

J. J. Healey, Chicago, Ill., used Parker gun, Du Pont powder and U. M. C. shells.

R. Kuss, Chicago, Ill., used Greener gun, E. C. powder and U. M. C. shells.

G. W. Dering, of Columbus, Wis., used Parker gun, Du Pont powder and U. M. C. shells.

R. R. Kimball, of Omaha, Neb., used Evans gun, Du Pont powder and U. M. C. shells.

H. E. Lee, Chicago, Ill., used Greener gun, Du Pont powder and U. M. C. shells.

H. Odell, Chicago, Ill, used L. C. Smith gun, Du Pont powder and U. M. C. Shells.

E. S. Graham, Chicago, Ill., used Parker gun, Du Pont powder and U. M. C. shells.

C. M. Grimm, Clear Lake, Ia., used L. C. Smith gun, Du Pont powder, and U. M. C. shells.

L. C. Willard, Chicago, Ill., used Greener gun, Du Pont powder and Leader shells.

Parker, Chicago, Ill., used Parker gun, Du Pont powder and U. M. C. shells.

J. J. Hallowell, Bridgeport, Conn., used Smith gun, Du Pont powder, and U. M. C. Trap shells.

Geo. Roll, Blue Island, Ill., used Remington gun, Du Pont powder and U. M. C. Trap shells.

E. E. Neal, Bloomfield., Ind., used Parker gun, Du Pont powder and U. M. C. Trap shells.

W. B. Leffingwell, Chicago, Ill, used Smith gun, Du Pont powder and U. M. C. shells.

J. L. White, Chicago, Ill., used Greener gun, Du Pont powder and U. M. C. shells.

Tom Marshall, Keithsburg, Ill., used Cashmore gun, Du Pont powder and U. M. C. shells.

Ed Bingham, Chicago, Ill., used Cashmore gun, Du Pont powder and U. M. C. shells.

Tom Laflin, Rock Island, Ill., used Parker gun, Du Pont powder and Winchester shells.

W. A. Parker, Rock Island, Ill., used Parker gun, Du Pont powder and Winchester shells.

E. Werk, Cincinnati, used Westley-Richards gun, Schultze powder and U. M. C. shells.

H. C. Hirschy, Minneapolis, used Smith gun, Hazard powder and Winchester shells.

Dr. Shaw, Chicago, Ill, used Greener gun, Du Pont powder and Winchester shells.

G. L. Dieter, Milwaukee, Wis., used Cashmore gun, Du Pont powder and Leader shells.

E. H. Tripp, Indianapolis, used Parker gun, Schultze powder and U. M. C. shells.

R. O. Heikes, Dayton, O., used Remington gun, E. C. powder and U. M. C. shells.

H. Levi, Chicago, Ill., used Smith gun, Du Pont powder and U. M. C. shells.

Wm. Harbaugh, Geneseo, Ill., used Parker gun Du Pont powder and Leader shells.

J. J. O'Brien, Dubuque, Ia., used Smith gun, Du Pont powder and U. M. C. shells.

Geo. McCartney, Des Moines, Ia., used Parker gun, Hazard powder, U. M. C. shells.

C. W. Budd, Des Moines, Ia., used Parker gun, Hazard powder and U. M. C. shells.

W. D. Sperry, Rock Island, Ill., used Parker gun, Hazard powder and U. M. C. shells.

Dr. Carver, Chicago, Ill., used Cashmore gun, Carver powder and U. M. C. shells.

J. C. England, Mt. Pulaski, Ill., used Wichester gun, Du Pont powder and U. M. C. shells.

Fred Gilbert, Spirit Lake, Ia., used Parker gun, Du Pont powder and Leader shells.

J. B. Barto, Chicago, Ill., used Parker gun, Du Pont powder and U. M. C. shells.

A. S. Kleinman, Chicago, Ill., used Scott gun, Du Pont powder and U. M. C. shells.

J. T. Fanning, Chicago, Ill., used Smith gun, Du Pont powder and U. M. C. shells.

J. Elias, Chicago, Ill., used Remington gun, Gold Dust powder and U. M. C. shells.

G. Miller, Rochelle, Ill., used Smith gun, Schultze powder and U. M. C. shells.

Jas. Huxtable, Ft. Sheridan, Ill., used Parker gun, Du Pont powder and U. M. C. shells.

O. Von Lengerke, Chicago, Ill., used Francotte gun, Schultze powder and U. M. C. and B. W. L. 2B. shells.

H. B., Chicago, Ill., used Parker, Du Pont powder and Leader shells.

O. E. Searles, Minooka, Ill., used Smith gun, Du Pont powder and U. M. C. shells.

T. P. Hicks, Chicago, Ill., used Standard gun, Du Pont powder and Winchester shells.

J. S. Boa, Chicago, Ill., used Winchester gun, Gold Dust powder and U. M. C. shells.

J. P. Worth, Milwaukee, used Lefevre gun, Du Pont powder and Winchester shells.

A. C. Paterson, Chicago, Ill., used Remington gun, Du Pont powder and Winchester shells.

J. Higgins, Chicago, used Parker gun, Du Pont powder and U. M. C. shells.

J. Roland, Milwaukee, used Lefever gun, Du Pont powder and Leader shells.

M. E. White, Milwaukee, used Remington gun, Du Pont powder and U. M. C. shells.

C. S. Wilcox, Chicago, Ill., used Scott gun, Du Pont powder and U. M. C. Trap shells.

S. Palmer, Chicago, Ill., used Greener gun, Du Pont powder and Leader shells.

The Trade.

Jack Hallowell, the U. M. C. Co.; C. W. Budd, Hazard Blue Ribbon powder, Parker gun, U. M. C. Co.; Fred Gilbert, Du Pont powder; Ed Bingham, Du Pont powder; R. O. Heikes, the Remington gun, U. M. C. Co.; A. G. Courtney, the Remington gun; W. T. Irwin, Laflin & Rand powder; G. A. Mosher, the Hollenbeck gun; H. C. Hirschy, Hazard Blue Ribbon.

E. Hough,
480 Caxton Building, Chicago, Ill.

WESTERN TRAPS.

Eureka Gun Club.

Chicago, Dec. 16.—The Eureka Gun Club shot but two events this afternoon at Watson's Park. In the first one, the trophy event, L. C. Willard won the high aveargе and also the first money, he being the only man that made a straight score, although in the second event be lost a bird.

Quite a stiff breeze blew directly in the faces of the boys at the score. The birds were a very lively lot. The absence of Dr. Carver was noted, and remarked upon. He is down in the southern part of the State, shooting quail with Dr. Miller.

No. 1 was the trophy event; No. 2 was at 6 birds, $3, two moneys:

Frank J. Baum

Championship of Maryland and District of Columbia.

Baltimore, Md., Dec. 15.—The handicap contest for the championship of Maryland and District of Columbia took place on the grounds of the Monumental Shooting Association, at Westport, today. There was a goodly number of onlookers in attendance. The conditions were 20 birds. They were a strong, selected lot. A strong southeast wind was blowing. The boundary of the grounds was 30yds., with a 24yd. dead line. Hicks, Hood and Malone were the scratch men, 31yds. Malone, Hicks and Leland tied on 19, and in the shoot-off Malone killed straight and became the champion under the conditions governing the contest. Two birds were liberated in the 10th round for Hood, and he accepted one and lost it. He could have refused the birds, but hesitated and lost. Malone shot a Parker hammerless gun, with 3½drs. Schultze powder, 1¼oz. No. 7 shot in U. M. C. factory-loaded shells.

The scores:

Hicks, 31.....1222222222222222022222220—23

Brockton Gun Club.

Brockton, Mass., Dec. 9.—Following are scores of our shoot of to-day. The weather was perfect for this time of year. The scores averaged well, Leroy being high with .920. Baker, our newest member, has been shooting for only three months, and to-day averaged .800. In the team race between Brockton and Boston, five-men teams, 30 targets per man, Boston won by 4 targets:

Boston Gun Club—Woodruff 28, Cole 28, Miskay 28, Horace 23, Gordon 22—129.

Brockton Gun Club—Leroy 29, Stork 25, Worthing 24, Wood 24, Barrett 23—125.

Nos. 1, 2 and 3, at 10 targets each, comprised the team race, and Nos. 4, 5 and 6, at 20, 15 and 15 targets, formed a 50-target race, in which Leroy, 46, was first; Lambert, 45, second, and Barrett and Horace, 44 each, third.

Events:	1	2	3	4	5	6	7	8
Targets:	10	10	10	20	15	15	10	10

A. A. Barrett, Sec'y.

Audubon Gun Club.

Buffalo, N. Y., Dec. 16.—At the Audubon Gun Club's shoot, held to-day, Mr. E. C. Burkhardt did the best shooting, winning Class A badge and making the high score in all of the events. No. 3 event was the badge shoot. Jacobs won Class B. badge. The club will celebrate the holidays by a target and live-bird shoot.

Events:	1	2	3	4	5
Targets:	15	15	25	20	*
E C Burkhardt	15	12	21	16	7

IN NEW JERSEY.

Hudson Gun Club.

Jersey City, N. J., Dec. 18.—Following are the scores shot by the members of the Hudson Gun Club, of Jersey City, on Dec. 18. The light was very poor, which accounts for the mediocre scores made by the contestants. A grand opening shoot at targets will open the Twentieth Century on Monday, Jan. 1, 1900, New Year's Day, beginning at 10 A. M.; targets at 1½ cents each. To get to these grounds take the yellow Newark Turnpike car to the Hackensack River bridge from the terminis of the P. R. R. ferries, Jersey City. A good hot lunch served free to shooters.

Events:	1	2	3	4	5	6	7	8
Targets:	15	15	15	15	15	15	15	25
Dr Bill	11	9	11	9	13	8	11	18

J. Hughes, Sec'y.

Walsrode Gun Club.

Trenton, N. J., Dec. 13.—In No. 1 event Bower and Mickel tied for the ticket. In No. 2 Bower won out on 9 out of 10. Thomas won ticket in No. 3, Harrison in No. 4, and Lettes in No. 6. In No. 7 Harrison and Thomas tied, and shooting off at 5 tied twice on 3. In the third shoot-off Thomas won. The ties were shot by moonlight. Johnson did not contest for prizes. In No. 10 Harrison won the shoot-off. No. 11, for silver, was won by Lutes.

Events:	1	2	3	4	5	6	7	8
Targets:	10	10	10	10	10	10	10	15
Mickel	5	8	5	..	3	..	..	10

Trap Around Reading.

Reading, Pa., Dec. 16.—The Leaders, captained by P. Yost, today defeated the Atlas team, captained by Eshelman, in a series of team shoots for teams of two men each, each man to shoot at 25 targets, best three in five matches. Eshelman's shooting for the Atlas team was fine, but Ball was out of form, and his scores to-day were never as poor. The scores follow:

Leaders. Matches:	1	2	3	4	Atlas. Matches:	1	2	3	4
Yost	17	18	22	18	Ball	9	17	10	9
Matz	18	15	19	17	Eshelman	21	18	21	21
Total	35	33	41	35	Total	30	35	31	30

The fifth match was not shot, owing to the Leaders' winning three and the series. Another chance will be given the Atlas team to redeem themselves on Dec. 23, when the same teams again meet.

Dec. 16.—John Shaaber, of this city, and N. W. Benner, of Boyertown, Pa., will meet in a 100-target match, $20 a side, on Jan. 1, at Three-Mile House shooting grounds. At the same time Wm. D. Gross and John Shaaber will hold a two days' shoot. First day, Jan. 1, targets; second day, Jan. 2, the principal event will be a 15-live-bird handicap event, $10 entrance, handicaps 25 to 31yds., open to all. The programme will also consist of several live-bird events, while several events will be at targets over the magautrap. Arthur A. Fink, of Reading, has been selected as referee in the Shaaber-Benner match, and holds a $10 forfeit of each shooter. Electric cars run direct to the grounds every 20 minutes from Third and Penn streets, Reading. Good birds have been secured for the live-bird events.

Shenandoah, Pa., Dec. 16.—John Brennman to-day defeated Thomas Cinnon at the Trotting Park, this place, in a live-bird match, 5 live birds, Schuylkill county rules—one barrel—by the score of 4 for Brennman to 2 killed by Cinnon. The match was for $25 a side.

Duster.

Arkansas and the South.

St. Louis Doings—Busch Medal.

St. Louis, Mo., Dec. 6.—Mr. A. D. Mermod, formerly of Colorado, has recently moved to St. Louis, and being an inveterate pigeon shooter, he at once began to make his presence felt in local circles. Being a shooter of no little ability, he thought he would try and gain possession of the much-coveted Busch trophy, so he proceeded to issue a defi to the holder, Mr. John J. Sumpter. This brought about the race to-day, and the new comer actually cut out the work for the holder, and for a long time the latter's honors were very much in jeopardy. Sumpter lost his 8th, while Mermod negotiated them all but the last one, which fell dead out of bounds, and thereby the match resulted in a tie, as each had a total of 24. The tie was not shot off, and will not be for several weeks, as Mermod had to go to Colorado to wind up his business affairs there, and he will be absent about ten days, but on his return matters will be brought to a more definite isssue.

Mermod .....222222211222212221112l220—24
Sumpter .....222222202222222222222222—24

The Sumpter-Dr. Smith match has been declared off for good, Dr. Smith declining to shoot off the tie, and preferring to draw down his money. Thus the matter of supremacy between these two shots is still an open question, though Sumpter defeated the Doctor in a race last year.

Memphis—Nashville.

The pigeon shooters of these two cities will engage in a little friendly contest at Memphis on Dec. 30. My informant could not tell me if this was to be a team contest or just a sweepstake affair or trophy contest. This will also inaugurate the pigeon shooting season of the Memphis Gun Club.

Paul R. Litzke.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1899, BY FOREST AND STREAM PUBLISHING CO.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, SATURDAY, DECEMBER 30, 1899.

VOL. LIII.—No. 27. No. 346 BROADWAY, NEW YORK

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, $4 per year, $2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iv.

CONGRESS AND GAME EGGS.

Now that Congress has fairly got down to work, an effort should be made to repeal the foolish clause which Senator Lodge caused to be incorporated into the tariff bill forbidding the importation of the eggs of foreign game birds. The Massachusetts Senator has explained that he was led to urge the adoption of this prohibition by the representations made to him by those misguided individuals who affected to believe that the American supply of wild ducks was in peril of extermination at the hands of the Indians in the Northwest, who were gathering the eggs for shipment into the United States for conversion into albumen. There was never a sillier story in the whole range of shooting and commerce; we demonstrated its absurdity at the time. Yet Senator Lodge and a number of his colleagues were deceived by the canards into the well-meant but unfortunate support of the prohibitory regulation. They appear to have accepted the "duck egg fake," and to have taken it on no better authority than the unsupported assertions of people who did not know what they were talking about. It is a curious instance of the quick travel of a lie, and of the easy credulity which accepts as truth statements which a very slight consideration would show to be fanciful and untrue.

If only duck eggs were concerned, the operation of the law would be absolutely without any effect, good or bad; but it happens that the statute acts to the detriment of our game interests by preventing the importation of partridge eggs from Europe for stocking purposes. Many owners of game preserves would stock their covers with the partridge if they could obtain the birds. The only practicable way to get the birds here is by importation of the eggs. But consignments of partridge eggs have been interrupted and held up at the New York Custom House as being contrary to the statute. It is a foolish law. If Senator Lodge is desirous of serving the interests of sportsmen and doing something to promote the game supply of this country, he may well undo the injury he has unwittingly done.

The movement by Massachusetts sportsmen to unite in an association of effort to secure reform in game protection affords much promise. There can be no question that in recognizing the marketing of game as one of the essential factors of the situation the promoters of the new agitation have taken a sensible view of the problem. The Boston open game market is wrong in principle, and being wrong it acts injuriously, not only upon the interests of all other States from which it draws its supplies of illicit game, but upon the interests of the Commonwealth as well. The game dealers of Boston are credited with being powerful in the committee rooms on Beacon Hill, but the united sportsmen of Massachusetts should find a way to overcome these influences.

At the annual dinner of the Boone and Crockett Club, which takes place Jan. 20, the usual custom with regard to speakers will be followed. It will be remembered that two years ago after the dinner Mr. A. P. Low, of the Canadian Geological Survey, gave the club a most interesting talk on the little known Peninsula of Labrador. Last year Prof. Henry Fairfield Osborn told them about the great game which inhabited the Rocky Mountain region in Jurassic time. This year the club will have the privilege of hearing from Mr. E. A. McIlhenny, of Avery's Island, La. Mr. McIlhenny is well known as an enthusiastic ornithologist, and it will be remembered that in the pursuit of his studies he has spent some time in the far North—among the birds, the beasts and the people of the arctic regions. It is about this far-away land that he is to talk to the Boone and Crockett Club, and the relation of his experiences will be illustrated by stereopticon slides. The occasion will unquestionably be one of great interest.

THE PRIMITIVE BUFFALO HUNTER.

A LONG time ago, in the early, early days of the West, before the explosion of a gun had disturbed the quiet of the prairies or its smoke had polluted their pure, sweet air, there were people in that land, and those people had to be fed. Then there were no horses, on which to chase the game, nor had white strangers, with long hair hanging down from their faces, brought into the country the heavy, soft stone* which afterward made the people's arrow points. At that time the knives, the spear heads and the tips of the arrows were all made of hard flint stone.

Far back, in still earlier days, the people had neither bows nor arrows, and the traditions tell us of a time when they set snares in the trails, by which the animals traveling along them were captured and held. Then, when the man found a captured animal he beat it to death with the great stone-headed club which was his only weapon. But even in our times, though in early days, the Indians in that country had methods of securing game in which the bow and arrow played but a minor part, being used only to kill the game after it had been captured.

The most common method employed in capturing buffalo and antelope was to decoy them into a lane much wider at one end than at the other, and to drive them down this into a pit or a pen, built under a cliff or cut bank, where the converging boundaries of the line came together. When they jumped into such a pit or such a pen, they could not escape, and were killed at leisure. Traps of this description are so simple that they were probably common to many primitive races. We see the same principle at work when wild fowl are netted by the wholesale in the marshes of Europe, as well as in the devices often used along our seaboard for capturing various sorts of salt water fishes. In the case of the animals, advantage was taken of the well-known fact that these beasts, when they saw on the prairie any unusual object, would often approach it to see what it was.

The man whose duty it was to lead the buffalo into the trap felt that on his shoulders rested a great responsibility. Whether the people should starve or should be fed depended on his success. He therefore prepared himself for his duty by fasting and prayer, and at the appointed time set out on foot over the prairie toward the buffalo herd whose destruction it was intended to compass. He was followed by most of the men and boys of the camp, who distributed themselves behind the heaps of stones or piles of bushes which marked the two diverging fence lines. Meantime, he who was to call the buffalo approached the herd, keeping himself partly concealed, so that the animals could not clearly make out what this moving object was.

When he had come as near as he thought best, he made strange motions and queer noises to call their attention, and as the buffalo began to look at him he moved further and further away from them. The young animals were the first to raise their heads and stare long and intently at this mysterious creature, which was not a buffalo nor an antelope nor a wolf nor any one of the common dwellers of the prairie. After the young buffalo had looked for a long time, they walked forward to get a better view, and the older ones began to look also, and to follow the younger, and soon the whole herd was in motion, at first walking a few steps and then stopping and looking, and then walking forward again. Before long the younger buffalo, instead of merely walking, would trot a little way and then stop again, and as they trotted the young bulls and heifers would perhaps begin to play, one galloping after another, and thus communicating a feeling of unrest to the whole herd. It was not very long now before the whole herd was galloping after the buffalo caller, who all the time had been drawing away from them in the direction of the opening of the chute which led to the pen. At the same time, he constantly kept himself so far exposed to their sight that the interest taken in him by the buffalo did not flag.

So soon as the herd was galloping after him, the buffalo caller ran as hard as he could straight for the entrance of the chute, and then down between the wings toward the pen, and the buffalo followed hard after him. After they were well within the wings, however, the people, who were concealed there began to play their part. As the herd passed them they rose to their feet, yelled and swung their robes in the air, and as this was done at each place of concealment, people were constantly near to the herd, and it grew more and more frightened. By this time the buffalo had forgotten all about the man who was calling them. Instead of an attraction in front which was drawing them on, there was now a danger behind, from which they were fleeing. As the wings of the chute drew nearer and nearer together, the buffalo caller, perhaps almost exhausted by his long run, darted behind one of the rock piles and lay hidden there, while the buffalo with thundering hoofs and before a great cloud of dust, dashed past toward the jumping-off place, beneath which lay their doom.

Usually the buffalo followed a straight course down the middle of the chute, and often all of them jumped over into the pen. Many were killed, crippled and wounded by the fall, while many others escaped unhurt. If the band was a very large one, its crowding and jostling as it ran round the pen sometimes pushed down the wall, and all the animals escaped. For this reason the effort was usually made not to bring a large band of buffalo between the wings of the chute.

The Indian camp was usually placed somewhere close to the pen, and in the morning after the buffalo caller and the men had started out to try to bring the herd, the women and children and boys made their way close to the pen and lay concealed there. For a long time they waited, while nothing happened. Then suddenly from the upper prairie faint sounds began to reach them; distant yells, shrieks and whistles, constantly growing nearer, then the rumbling sound of the running herd, then—almost at once—the black masses, sliding, rolling, tumbling down into the pen close to them. Now the women and children rushed to the walls of the pen and clambered up on them, showing their heads and parts of their bodies over the wall. All were greatly excited, and called and yelled and made the sound of alarm, *Hoo, hoo,* or shouted out *i ni uh* (buffalo). The frightened animals crowded away from the walls, and with heads down, tails up and tongues lolling from their mouths, rushed round and round the pen as circus horses gallop round the ring. The pen was filled with dead and wounded, injured by the fall or run over by others, or hooked by the horns of their fellows.

Soon the men came hurrying down the bluff, and they too mounted the walls, and with their arrows shot and killed those animals that from one cause or another had not already fallen. When all were down, the women entered the pen, and destroyed the wounded and crippled by smashing in their skulls with great stone hammers.

And now for days there was a time of hard work. All these animals had to be skinned and cut up and the meat carried to the camp and there distributed and dried. The hides must be taken to the camp, fleshed and tanned into robes, or lodge skins. The pen must be cleaned out and the offal, heads and bones removed to a distance. Every one was busy. But though the work was hard, food was plenty; for the time the danger of starvation had passed, and all were happy.

Always about the pen, when it was in use, there were great numbers of wolves, coyotes, badgers and kit foxes, and these helped to clean up the débris of the butchering left in the pen. Sometimes the young men and boys fixed snares of sinew over the holes through which these animals crept to get at the meat, and captured numbers of them.

In those primitive times, antelope were caught in almost the same way, except that instead of a pen at the point where the wings of the chute came together, a pit was dug, into which the animals were driven. Then the men descended among them with clubs and killed them. Sometimes, it is said, an antelope would be so paralyzed with fear that it would not try to avoid the man with the club, who might kill it with his knife.

In connection with all these methods of taking food by wholesale, elaborate religious ceremonies were performed and generous sacrifices made. These simple people seemed to feel that they could have no success without the help of a higher power, and with all their hearts they prayed to him to aid them, to give them life, to let them, their wives and children eat and live and have strong bodies. When they were successful, the choicest parts of the fattest buffalo or antelope were offered to this higher power and to his servants, and with these presents of food were given other presents of the most valuable possessions that they had.

How great must have been the abundance of the ani-

* Iron.

mals, which furnished the Indian his support, cannot be realized in these days. Only those who many years ago have traveled for weeks at a time over the plains black with buffalo can comprehend how rich were the resources of these primitive people. Without such abundant food supply to draw on, the Indian could not have existed. He was a man of the stone age, and the simple armament with which he was provided could not alone have supplied him with food. Even when supplemented by the devices here described and pictured, he starved if the buffalo moved away from the neighborhood of his traps.

Our double page illustration supplement to-day is devoted to a picturing of the old-time method of "Calling the Buffalo." The several ways of the lure, the drive and the fall are shown with fidelity to the Indian mode; and Mr. Deming has admirably caught the spirit of the chase as it was practiced on the Western plains.

WILLIAM SENIOR.

SINCE the death of his eminent predecessor, Francis Francis, Esq., some fifteen years ago, no member of the British angling guild has been so highly regarded as Mr. William Senior, the angling editor of London Field: for he is not only venerable (age sixty), but he is as genial as he is talented. All that he writes, or ever has written, over the familiar signature of Red Spinner, either as contributor or author of many charming books, is so juiceful of *bonhomie* that he seems personally to take his reader by the hand and say "Come with me." He is a living *vade mecum*. Behold him, as he lopes over the heather to his favorite salmon pool, with his jack-staff a-cockbill, and his blue peter streaming out straight with the accelerated gait! That's Red Spinner every time; and as he strides, the atmosphere glows like a halo. He toils not, but see how he spins.

In the year 1898-9 he was the honored president of the Fly-Fishers' Club of London, and was present at their annual dinner in February last, when grace was said before meat, and all took coffee for dessert, and nothing stronger. Sir Samuel Montague was chairman then, and Mr. Senior and the Hon. R. B. Marston, of the London Fishing Gazette, were vice-chairmen. Mr. Marston had been president of the club the previous year. Later on, in October, the same club gave him a notable dinner at the Trocadero, and apotheosized him as the second Walton, crowning his statuesque bust with ivy green and laurel from the precincts of the "compleat" angler's ancient fishing box at Dee side. The occasion was in memory of his retirement from the ranks of daily journalism, after forty years of service on the London press. Several eminent artists assisted, and all his friends and colleagues were present. Mermaids, tritons, fish baskets and quill pens rampant supported the pedestal of the bust.

"I have taken this step," he writes, "with the view of easing off a little, and being able to devote the future to fishing and fishing literature. Of course, I keep up my connection with the Field, and shall next year have more opportunity to roam about with my rod than I have ever had in my life."

We dare say the public will not be disappointed in the presage; and we trust that the gentleman's life may be spared even though the rod be spoiled, since he declares in a note to the undersigned, who has been his compeer for so long a time, that he is carrying his added years lightly, and has not the least idea that he has passed his middle age yet. He adds: "It is only when I look into the family Bible [he does not say mirror] that I am conscious of the fact." And his physique does not refute his impression, for he looks hale and hearty; not like an Englishman, as it were, but rather like a combination of sturdy Scot with the jolly good fellow. Long may he fish!

Hereafter those who love his books and his angling gossip may look to the "Passing Comments" column of London Field for their chowder; which we doubt not will be as "filling" and palatable to their mentality as were the charming "Waterside Sketches," the "Mixed Bag," "Travel and Trout in the Antipodes," "Angling in Great Britain," "By Stream and Sea" and other volumes, which are now perhaps out of date and out of print, but by no means out of mind.

CHARLES HALLOCK.

We had occasion last week to comment upon the extraordinary decision of the California Supreme Court, that a non-export game law was unconstitutional because an invasion of private property. To-day we give a Minnesota Supreme Court affirmation of the right of an Indian tribe to hunt on the reservation in violation of the State law. This also is contrary to the precedents; and it is to be regretted that the Commission's attorney should not have moved for a new test of the question.

The report of the Onondaga Anglers' Association, of Syracuse, N. Y., is deserving of careful attention, because it illustrates a mode of work undertaken by private citizens for the public good, which is well worthy of emulation.

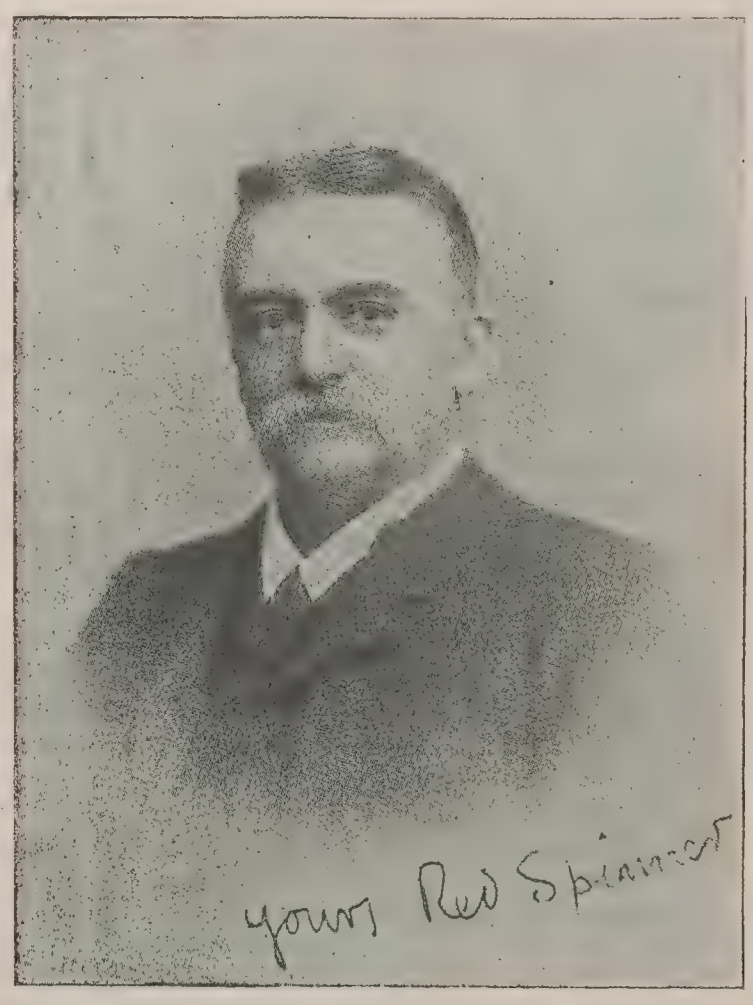
The Sportsman Tourist.

Sam's Boy.—V.

ONE dewy morning Antoine made his appearance with a hoe upon his shoulder to work in the garden, according to a previous contract, and Sammy soon came to while away the morning hours with a friendly visit, sweetening the self-imposed duty with a lump of maple sugar moulded in an egg shell. Its hard rotundity resisted his attempts to get a full bite, and he had only succeeded in grooving it with the marks of his milk teeth.

Antoine, noting it, asked, "Wal, you gat some hen lay dat kan o' aig, prob'ly?"

"No; Aunt 'Rushy done it," the child answered.



"She pooty good hen, a'n't it?" said Antoine, quickly.

"Aour hens lays aigs wi' chickens in 'em. Does yourn?"

"Sometam he do, sometam he don't," the Canadian answered. "On ma hol' hen dis sprim come aout hees nes' wid ten leetly dawk. W'en dey come on de brook dey all of it jomp on de water, an' dat hol' hen he was crazy for fraid dey all be draown."

Sammy was not entirely credulous, and made a mental note that he would tell Uncle Lisha that Antoine had hens that laid duck eggs, and ask his opinion of the story.

"You lak de mepple sug' aig pooty good, a'n't it?" Antoine continued, after a little waiting for further

WILLIAM SENIOR.

questions. "Wal, sah, if you lak it you want for go long to me in Canada sometam. Oh, dar was hol' great big montaigne dar, all mepple sugre. Yaas, sah; dat was de place for leetly boys, Ah tol' you."

Sammy was inclined to think so too, and began to look with contempt upon his gnawed morsel. "As big as Hog's Back?" he asked.

"Gosh, yes; big as 'Tater Hill! Haow you 'spose he come so? Wal, sah, Ah'll goin' tol' you 'baout dat. You see, dar was great many, plenty mepple tree, prob'ly t'ousan', grow on one big montaigne—one dat dey call vulcauno, got fire inside of him, burn all de tam, all de tam, an' smoke lak forty coal pit. Den one tam in de spring dey comes some awfuls t'under an' li'thin's an' he stroke all dem tree an' split it lak kindly hwoods, so de sap all run off in brook as big as Stonny Brook an' ran inside de montaigne, an' he bile, an' bile, so he bile over, an' it was mepple sirrup run aout an' run daown all de side dat montaigne, an' when he got cool off it was mepple sugre, four, fave, prob'ly t'ree foot t'ick, more as on' acre of it; an' all you gat for do was chawp it up wid axe an' carry him off. Ah'll goin' tak you dar sometam if you want it!"

Sammy declared that nothing would please him more, and Antoine went on. "But you gat for look aout for bear. Dey come from all over for gat dat sugre. Ma gran'fader he keel more as fifty dar." This consideration made Sammy hesitate to accept the invitation, and in his agitation he pulled up a freshly sprouted bean.

"Dar! see what you do, bad leetly boy!" cried Antoine. "Bah gracien! 'f you do so bad lak dat bete an' grand cue gat you!"

"What sort o' thing's that, Mr. Antoine?" Sammy asked, with a determination not to be frightened without knowing why.

"Oh, dat was kan o' t'ing dey gat in Canada dat ketch leetly boy if he a'n't be good!"

"How does he look?" Sammy asked, with increased curiosity.

"Oh, he'll gat tails longer as everyt'ing, an' he win' it raoun' leetly boy's neck of it an' choke it so he can' breeze!" Antoine's vague description of this Canadian invention for the better management of children was not satisfying.

"I guess I be good an' go to the sugar mountain."

"Yas, dat was de bes', an' de milk river, too, dat was pooty good for leetly booy."

"What's that?"

"Oh, you see, one tam gre't many year 'go, dar was hol' whomans, hol', hol', an' lame so she can' mos' go. was travel long one naght, an' come on rich farmer haouse an' ask it if he can stay all naght, an' dey hugly, an' say 'No,' an' drove it off. Nex' he stop on poor man haouse, a'n't mos' gat 'nough for heat heself, an' dat man tol' it he can stay, an' give it bes' he gat. Nex' morny dat rich man caow, twonty of it, all, all dry aout, an a'n't give some more milk, never; an' dat poor man cow w'en de whomans go meet him, hees milk run so you never see, four stream, all so big lak Stonny Brook, all ron in one an' mak' river so big canoe could go on it, an' he run so forever. An' dat mans got big rich, an' rich farmer mans gat poor so he on de taowns. Dat hol' whomans he was weetch, an' dat de way he pay it. Naow if you go dar an' want for heat some breads an' milk, all you gat for do was jomp on boats wid your spoon an' loafs of bread an' jes' drop him on de river an' pick him up wid you' spoon as you go 'long. Dat was pooty comfortably, Ah'll tol' you. An' 'f you'll drudder had bread an' butters, all you gat for do was go to de falls, feefty foot high, dey was, an' roar lak some bulls, only kan sof'ly, an' dere you faound more butters as you can see in two week, 'ca'se de falls he churn hese'f all de tam, an' all de river beelow was buttermilks, an' all berlong of dat mans, an' he was happy, 'cause he a'n't never had for churn—dat was mean works for mans, Ah'll tol' you!"

"Is that a true story, Mr. Antoine?" Sammy asked, his eyes growing rounder with wonder.

"Yas, sah! Jes' as true as dat mepple sugre montaigne," Antoine declared, with unquestionable seriousness.

These tales made Sammy so hungry that he was obliged to run in at once for something wherewith to appease the yearnings of his stomach. When Aunt Jerusha had provided him with a great slice of bread and butter, he went into the shop to confer with his bosom friend, who, after a comprehensive glance over the rim of his spectacles, said:

"Bub, he'd better seddaown t' eat that 'ere lund o' bread and butter, 'cause if he should drop it ont' his toes, 'twould smash 'em."

Sammy took the advice at first as seriously as the expression of Uncle Lisha's face seemed to demand and complied with it. But when he had wiggled his toes in his shoes, and considered their power of endurance, his philosophical conclusion led to rather contemptuous dissent.

"Pooh! Guess it wouldn't hurt 'em. They're harder'n bread an' butter!"

"But ju' look o' the size!" Uncle Lisha urged. "You couldn't find you toes 'nunder it."

Sammy wiggled his toes contemplatively, and regarded the rapidly diminishing slice and dismissed the subject.

"Say, Unc, Lisher; you s'pose Mr. Antoine talks true?"

"What's he b'en tellin' on ye?'

"Oh, he say o' the's rocks o' sugar an' a river o' milk in Canerdy, an' he's got a he hen 'at lays aigs leetly ducks comes aout on!"

"Shaw! Ann Twine's French, an' his tongue gits twisted tryin' tu talk English. I spect it kinder gits away from him oncte in a while an' he do' know what' 'tis sayin'."

"Would your'n act so if you talked French, Unc' Lisher?"

"I da' say 'twould," the old man answered, with a twinkle in his eyes.

"Unc' Lisher!"

"Wal, sonny; what is 't?" the old man responded, speaking out of one corner of his mouth while the middle of it held a dozen shoe pegs ready for his fingers.

"How does a wild pigeon look?"

"Oh, they're proper harnsome, wi' gre't long tails."

They hain't them things Antoine says ketches little boys when they hain't good, be they?" Sammy asked in some alarm.

"No, inded, they hain't. Ann Twine, he tells whoppers, he does. What makes Bub ask 'baout pigeons?"

"'Cause you tol' me the'd be some on that posy tree over tu the woods, an' it's full o' some big birds naow. They've got long tails, an' when they fly they clap their wings ju' like the ol' rooster 'fore he crows. You said we'd go an' shoot 'em. Will ye?"

"Good airth an' seas! Uncle Lisher couldn't no-ways this mornin'. He's got tu get these shoes tapped for an ol' womern 'at neds 'em bad. If 't wa'n't nothin' but a man, I'd let 'em go."

"What be I goin' t' do? Daddy's gone away, an' his gun's tew big!"

"Wal, I guess the leetle boy'll hafter wait," said Uncle Lisha, whacking away alternately at awl and pegs.

ROWLAND E. ROBINSON.

[TO BE CONTINUED NEXT WEEK.]

That terrible individual the statistician is at it again, this time to show man's muscular inferiority to beasts and insects. The comparisons are these: A horse has four legs and can run a mile three times as fast as a man, yet a man, in the long run, can wear down the quadruped. A good-sized lion will weigh about 450 pounds—three times the weight of a man—but a man cannot carry his own weight with ease. A lion, however, will easily carry off a bullock weighing over 1,200 pounds and break its neck with a single blow of its paw. A grizzly bear weighing only 300 pounds has been seen to carry an 800-pound steer for over a mile up a rocky mountain side, and two Polar bears have been watched upsetting a rock weighing half a ton which was frozen tightly to the ground. Large apes exert incredible strength. It took eight men to hold an ourang less than 5 feet high which had escaped from his cage on a French steamer. With all his inventive genius man can move in a train at a speed of 60 miles an hour, yet a swallow can fly 80, the duck 100, the gray crow 108, and the swift 150 miles an hour. A man can jump just over 6 feet, or half what a red deer can do. The chamois and springbok can both attain greater heights, and the black jaguar will reach a branch 15 feet from the ground. Then we are reminded that if man could run as rapidly as a small hunting spider he could spring a quarter of a mile without trouble and run at the rate of twenty-four miles a minute! Happily he cannot.

Lost in the Swamp.

ONE Sunday about June 1 my friend Robert High came over to make plans for a fishing trip to Trinity River and some small lakes near there. It was agreed that I should go over to his place the next Tuesday and we would go and stay till Sunday. So Tuesday morning about 5 o'clock I saddled my pony, took some coffee, corn meal and blankets, a .38 Winchester, a belt full of cartridges and a box full besides, as I expected to have some shooting at gars and maybe an alligator or two. I got to Bob's about 8 o'clock. As there were six others going with the wagon, it was decided that we would go to Patterson Lake and camp there. We had dinner and then Bob and I started ahead and left the rest to follow in the wagon. It was very warm, so I thought we would take a short cut through the woods and get to the lake and get some fish for supper by the time the rest got there.

It was about twelve miles to the lake. About two miles from the river we struck the river bottom. It was mostly prairie from there to the river. The lake was close to the river. There was a steep bluff all along the bottom, and the river overflowed back to the foothills. There had been a big overflow not long before, and we expected to find good fishing in the lakes.

We started across the prairie to a bunch of timber, where Bob said there was an old road that led to the lake. After riding about three miles we got to the timber, but found no road. We rode around some time, but could not find it. Then we started for another bunch of timber about a mile away and rode around that, but found no road. We sat down in the shade a while and then started again. We finally found a cow trail that we thought led to the lake. We followed this a short way and found the lake. It was then about sundown and too late to fish. We found a good camping place, staked out the horses, built a fire and sat down to wait for the wagon. It got dark and no wagon came. Bob said he would go and look for it. He said he would ride back to the hills, and if I heard him shoot twice to answer him the same way, for when he got a mile from camp the bunches of timber all looked alike, and he might not find the way back to camp. He was gone nearly an hour when I heard him shoot twice with his six-shooter. I answered and he soon rode into camp and said he had not heard anything of them. We were getting pretty hungry, and as all the grub was in the wagon we began to think we would have to wait till morning for our supper.

We waited a while and then I said I would go and look for them. The moon was up and I would have a guide to go by. I had never been there before and did not know the country. But I started out to where the road came down from the hills; and when I got nearly there I heard both barrels of a shotgun and some one holler as only a Texan can holler. I answered with two shots with a six-shooter and started to find them. I soon found them. They said they had got lost trying to find the lake. It was so warm they did not get to the river bottom till dark, and then went the wrong way to find the lake.

We struck out across the prairie for camp, which we found without much trouble; and we got some supper—corn bread, bacon and coffee; but it tasted good to hungry men. Then we got out the blankets and tried to sleep; but the mosquitoes didn't. We soon found it impossible to sleep without some protection. I went to the wagon and got a sack and pulled that over my head and went to sleep; but those who could not sleep would not let the rest, and the next thing I knew some one had me by the heels dragging me toward the lake and yelling, "Wake up, Billy, or we will throw you in the lake. You ain't going to sleep if the rest can't." We spent the rest of the night sitting around the fire.

As soon as it was light enough to see Bob and I got an old scow and paddled out to a sunken log to fish for trout and white perch. The trout were not speckled trout, but more like black bass. I would like to know the proper name for them. We caught a perch, skinned it and cut it up for bait. Our fishing tackle consisted of for each a cane pole, a stout line and hook; there were no snelled hooks and reels. I had never seen either one at that time.

The fish bit as fast as we could take them off, so we soon had a fine string of trout and white perch that would run all the way from ½ to 2 pounds.

We were about to go to camp and cook some fish when I got a bite, and he nibbled at the bait. I baited up again with the same result. Bob said, "Let's quit; I am hungry." "Well," I returned, "let me try once more; I believe it is a gar." At the first nibble I gave a jerk and thought I had caught on a log, but soon found I had a pretty lively log. The pole was pulled clear under water and then straight out, and a big gar (he looked to be 6 feet long) jumped out of the water, cut the line and went away. It would have taken a small rope and a piece of telegraph wire to have held that gar. Any one who has done any fishing in eastern Texas knows what an alligator gar is—6 and 7 feet long and nearly as large as a man's body. If I had had a good reel, plenty of line and a wire-snelled hook, wouldn't there have been some fun? But I didn't have, so we hardly ever landed one; and when we did it was a small one. The big ones would make just one pull, and something had to break.

The gars are a curse to the fisherman and fish in most of the Southern waters. They take off the bait and their jaws are so hard it is hard to hook them; and if you do they will cut the line. If you put out set lines for catfish they will eat the fish unless you get them off soon. If you leave fish tied to the bank they will get them.

After I lost the gar we went ashore, cleaned our fish and went to camp and fried them nice and brown and then sat down to a feast of fish, corn bread and coffee. And how we did enjoy it. How well I would like a few days of such times now. After breakfast some of the boys wanted to pull a seine. I don't think much of that kind of fishing. I like to fish with a pole and line, watch the float go under and feel the tug of a good fighter; it is the next best thing to killing a fine buck. Still-hunting for deer is the sport for me. But I went along to help pull the seine. The team was going home Friday and we wanted to send some fish home.

We were going to try some of the small lakes with the seine, as the lake where we were camped was too deep. We had brought some old clothes to wade in, so we could have dry ones after he got through seining. Bob took my Winchester and started on ahead, saying he might get a shot at a deer.

We went about a shalf mile and came to a small lake, which we thought we would try. As we went up to the lake an alligator rolled off a log on the other side. I heard a shot from the Winchester about the same time, and looked up and saw Bob. He said the had shot an alligator across the lake on a log close to where we had seen the one roll off in the water. Bob said he hit the alligator in the eye. It was a good 100 yards across the lake, and we laughed at his hitting an alligator in the eye at 100 yards. He said, "You go over there with the seine and drag it around the log and you will find him."

I did not much like the fun of pulling a seine in a lake with alligators in it, but the boys said: "Oh, come on, Billy; they will not bother us." As all the rest were going in I would not back out, so we started to pull the seine. The mud was so deep it was slow work; the water came nearly to our necks; we could feel the fish strike the net; but we went so slow when we pulled ashore that most of them got away. We had several good catfish and a few pike and some small gars.

We pulled it again with the same result. The third time we went close to the log where Bob said he had shot the alligator. We felt something dragging in the seine and pulled ashore and found we had an alligator about 5 feet long. The ball had hit him in the eye and knocked the top of his head off. It was nearly noon then and we went back to camp.

We got some dinner and the most of the boys lay down in the shade and went to sleep. The mosquitoes did not bother much in the daytime. I took my Winchester and went up the lake and got a good shady place on the bank and sat down to watch for gars. They will come to the top a few seconds and then go down again.

I got several shots at big ones, but could not get them after I killed them. I grew tired after a while and started back to camp. I found an alligator's nest that had been dug up by coons, and they had eaten the eggs. The eggs were about as long and about the size of a man's little finger, with a tough skin for a shell like a turtle's egg. When I got nearly to camp I found two big gars some one had killed and cut in two with an axe. They were big enough to bite an arm off. They are not the slim-nosed gar, but more chunky, with a broad, pointed nose and teeth like a crosscut saw.

"Well," I said to myself, "I don't go in swimming or pulling a seine in a lake with these gars."

I went to camp and lay down in the shade and went to sleep, and it was 5 o'clock when I woke up. Bob and I took the old scow and went out to the log where we fished in the morning and fished till dark; but they did not bite as good as they did in the morning, though we got enough for supper.

After supper we sat around the fire and smoked and told stories till about 10 o'clock, and then tried to get some sleep; but it was the same as the night before. The 'skeeters wouldn't let us. We had a pretty noisy camp that night. It takes a few Texas boys to make a good noisy camp. There was plenty of shooting, yelling and singing, but not much sleep.

But morning came at last, and we were all going fishing. We made some coffee, got a bite to eat and started out, Bob and I going together. We got the old scow and paddled out to the log, tied the boat and went to fishing. By 9 o'clock we had forty nice trout and perch. I was fishing with a light pole and small line. I got a good strong bite and knew it was a catfish. I let him have all the slack, and waited till I was sure he had the bait swallowed and then jerked, and I had him. And what a fight I had with that cat. The pole was about 12 feet and the line the length of the pole. He would take the pole under water and my arms up to the shoulder. We untied the boat and paddled out in the lake, and Bob would paddle the way the fish went, while I kept all the strain on him I dared to. After a while he began to get tired of towing the old scow. I pulled him gently to the top and Bob reached for him, but he ran under the boat and took the pole under the water again. Bob turned the boat around and I pulled him to the top again; but when he would see the boat he would make another break; but each time he came to the top sooner. We had no gaff, so Bob reached down, got a hand in his gills and pulled him into the boat. We could not weigh him, but judged him to be a good 25 pounds, which is a pretty good fish to handle without a reel. Going ashore, I took the catfish and put a rope in his gills and tied him in shallow water to keep him alive till I went home. Then after dinner we laid down in the shade to sleep.

Along in the afternoon Bob took my Winchester and started off up the lake. He did not get back till about sundown, when he came to me and said that about a mile up at the other end the water was not more than knee deep, with a good, hard bottom, and he had seen lots of big buffalo suckers feeding in the shallow water. It was a wild, dismal place to go in the night, he said, but if I would go we would go and spear some fish for the boys to take home the next day. He cautioned me not to tell the others where we were going, and we would have the fun all to ourselves. And we had it.

As soon as we had eaten some supper, we got the spear, head light, oil and a bag to carry the fish in; I took my Winchester, a belt full of cartridges; and Bob had a .45 Colts' six-shooter with a belt full of cartridges; so we were pretty well fixed. We did not know what we might run across. There were panthers and wolves, and once in awhile a bear, in this country.

It was dark when we left camp. We took a trail that Bob said followed close to the lake to which we were going. Bob went ahead with the head lamp on his head and I walked along behind. We had not gone far when Bob stopped and said, "Look at that." I looked and saw a big alligator lying across the trail. I brought the Winchester up and gave him a shot, but he never moved. And then Bob commenced to laugh. The alligator was already dead; some one had killed it the day before; and Bob knew it. We soon came to a big thicket that we had to crawl through. After awhile Bob stopped by a big log and said: "This is where we will build our fire."

I looked around to see what kind of a place it was we were in. The water was very shallow, and some big trees were growing in it. To our left I could see the open water of the lake. The trees were covered with long Spanish moss, which made it look awfully gloomy. We got a good fire started beside the old log and then began to get ready for spearing. I was going to leave my shoes and pants on; but Bob said it was a nice hard bottom, and we would take our clothes off and have them dry when we went back to camp. So we took everything off but our shirts. I set the Winchester against a tree and hung the belt on it. Bob hung his six-shooter and belt on a limb. Bob took the spear and put the head lamp on his head and we started out. I carried a bag to put the fish in. I wanted to take the bottle of oil, but Bob said we would not go far this time, and the lamp would burn an hour without filling; and we would not get out of sight of the fire, so we could soon fill it at any time. I would have liked to have taken the rifle, but was afraid I might fall down and get it wet. We were not afraid as long as we were in the water and had a light. We found plenty of fish and spearel several. I kept watch of the fire all the time, until at length we were getting nearly out of sight of it. I said, "Let us go back to the fire. These fish are heavy, and the lamp will not burn much longer." "All right," answered Bob. But just then we saw a gar, and he was a big one. Bob slipped up and drove the spear into him with all his might, but could not hold him, and he got off. The water was shallow, and we took after him. We soon found him and speared him again; but couldn't hold him. We took after him again, but soon found that we were getting into deep water, and looked around to see where we were. We could see the open water in the lake, and knew we were some way from the fire; but look as hard as we could we could not see the fire.

"Which way is the fire?" says Bob.

"I don't know. The last time I saw it was when we were chasing that gar; then it was behind us to the left, and I think it is in that direction now. Let us try and find the Seven Stars, so we will have a guide to go by." We both knew we could not keep a straight course with a lamp without something to go by.

But there were so many large trees growing in the water and so much moss on them that it was hard to see the sky, much less trying to follow stars for a guide. "Well," I says, "let's get a move on us. That light isn't going to burn all night." So we started to find the fire. We walked pretty fast and did not look for fish, for we both began to get uneasy. We walked for some time, but could not see the fire. Finally Bob stopped and says, "Well, Billy, we are all wrong."

"I have known that for some time," I answered. "This is the second time we have passed those two trees that grow together there. We are no nearer the fire than when we started to find it. Listen! What is that?" It was some wolves fighting over something they had found to eat.

"That's a nice noise for a man to listen to with no shooting irons and nothing on but a shirt. What is the matter with that lamp?" It was burning very low, and one wick was nearly out.

"Let's get ashore somewhere and try to start a fire; for if we don't get a fire we never will get out of here alive."

We started on a run this time, trying to find the shore. Bob took the lamp off from his head and held his hand in front of it to keep it from going out. We almost ran over a big alligator before we saw him, but we didn't try to spear him; we just ran the faster. We soon got where the water was more than 6 inches deep, and knew we were getting near the shore. One wick was out and the other very low; and we were getting badly scared. If that lamp went out our last hope was gone, for we hadn't a match nor any way to get a fire.

All at once we ran out of the water before we knew we had found the shore, and ran into some green briers, and they scratched our legs terribly. "Quick, Bob, and pull that wick out and I will get some dry cane to build a fire."

There was lots of switch cane growing there, and the dead stalks would burn up quickly. Bob pulled out the wick and I got some twigs; they burnt as long as the wick did and then went out. I pulled the other wick out and lit that just as the fire was going out. We both knew that that was the last chance. The wick burnt up for a few seconds and then died down. We got down on our knees, one on each side, and blew on it to get it started again. We were down on our knees blowing the fire when all of a sudden we heard the awfullest screech close to us. Bob jumped up and grabbed the spear, our only weapon, and looked for the panther to spring on us. I tore off part of my shirt, and that blazed up; then I put on some cane and got a fire started, and never have I been so thankful for a fire before or since. Everything was very damp, but we got a good blaze. We found an old tree-top and got some wood from that. We kept thinking of that panther, and wanted a big fire. Bob kept the spear in his hand and said: "If he comes for us I'll just tickle him with this."

It was not so easy to get plenty of wood. We were not used to going barefoot, and at nearly every step would land on briers. We were trying to get some wood when I almost stepped on a big water moccasin before we saw him. We hadn't thought of snakes before; all we had thought of was a fire, and here we were going around bare legged, where there were lots of water moccasins, and a bite was death. We went to the fire and got some fire brands so we could see where we were stepping, got what wood we wanted, broke off some boughs to sit on, and sat down to talk over the situation.

"Well," I says, "if we only had our clothes and firearms, we could stay here till morning."

"Suppose we take a look for them," answered Bob. "I don't believe they are far from here. We can make a torch and walk along in the water. We could see that fire a good ways."

So we made a torch the best we could, and started out; but the torch wouldn't burn; and we had to give it up, and went back to the fire and sat down. The skeeters were bad, and we had to keep whipping our legs with a bush to keep them off.

"Well," I says, "if we had our pipes and tobacco that would be some consolation. But we hain't got nothing but that spear and them fish. And here we be, lost, at least a mile from camp, and nobody living within five or six miles. The only thing we can do is to stick close to the

fire and make the best of it till morning."

After a while the moon came up so we could see it, and it was in the opposite direction from where we had been looking for it. But I soon found out what was the matter.

"Bob, we are on the opposite side of the lake from where we left our clothes and fire."

"Oh, no. It is a good ways across it."

"Well, you stand facing the moon, and the lake is on your left."

"Yes."

"We left our clothes on the same side that the camp is on, and when we are at camp, when the moon comes up you stand facing it and the lake is on your right."

"You are right, Billy. We have got to stay here till daylight."

And a long night it was. We got sleepy and tried to lie down and cover ourselves up with green boughs to keep the skeeters off; but the ground was pretty hard without even the protection of a pair of pants. After lying on the ground awhile we would get up and there would be the prints of the boughs in our flesh.

We kept a good fire and watched for daylight, which seemed as though it never would come. But at last the birds began to chirrup and we knew that day would soon break. As soon as we could see we started to find our clothes. We set out straight across the swamp, and had not gone far before we saw a big catfish, and speared him and then went on. We happened to strike the right place, and found our clothes and everything just as we had left them. The log had not burnt much, and the fire must have gone out within an hour after we left it. We put on our clothes and started for camp. When we got to camp the boys wanted to know where we had been. We said we had fished till we got tired, and then camped till morning.

"Oh," they said, "you and Bob were lost, or you wouldn't have stayed in that place all night." We owned up that we had been lost, but did not tell for a long time what a night we had put in.

The next morning the team and all the boys except Bob and me went home. We had made up our minds to go back that night and try it again till about 10 o'clock, and then start for home, so I could get home before the fish would spoil. As soon as the boys had gone we got the old scow and went fishing. We fished till about 11 o'clock and had a fine lot of trout and perch, and ought then to have gone home satisfied; but we wanted to try for those buffalo suckers again.

I took all the fish except what we wanted for dinner and put them in a sack with a bush in it to keep it spread out, and put them in the water to keep alive till we went home. We cleaned some of the smallest ones and broiled them over hot coals, made some coffee and had a good dinner, and then sat down in the shade to have a good smoke.

About 6 o'clock we cleaned all the fish, saddled up our ponies and started for the upper end of the lake, so as to get there before dark. We found an open glade not far from the old log where we had built the fire the night before. We hitched the ponies in the glade and then started a big fire. As soon as it was dark we took off our shoes and pants and went in the water. I took the bottle of oil this time, and Bob took his six-shooter. But the lamp gave a poor light; we had to make new wicks after burning the old ones up the night before. We could not see the fish till they swam off. We did not get out of sight of the fire. After fishing about an hour and only getting two, I says, "Let us go home."

So we went to the fire, dressed, got our ponies and started for home about 10 o'clock at night. I had about eighteen miles to go, and Bob twelve. We were going to keep together till we got to his place, then I had to go the rest of the way alone. We could have waited till morning, but then it would be so hot before we could get home the fish would spoil.

So we started, Bob ahead with the lamp on his head so we could see. We followed the trail to our old camping place, and then took a trail that led us to the prairie, and then put out the light and started for the hills, where we would find a road we would take home. We were both very sleepy, as we had not had a good night's sleep since we left home. After we got on the prairie I went to sleep on the pony, and the pony stumbled and nearly threw me off, and woke me up. We lit our pipes, and that helped to keep us awake. But it was no use; we could not stay awake; and after nearly falling off the pony two or three times, I said: "It is no use, Bob; I can't keep awake."

"Nor me, either," said Bob. "Let us lie down somewhere and sleep awhile, and then start again." So we hitched the ponies, lay down and went to sleep. It was nearly daylight when we woke up. I got home about 9 o'clock, and went to bed and slept all day and all night.

There are several hundred miles between Bob and me now, but I hear from him once in a while. The last time he wrote he said: "Say, Billy, do you remember the night we were lost in the swamp?" Well, I think I do.

STILL HUNTER.

The Adirondack Deer Law.

Editor Forest and Stream:

In one of your recent issues I saw a letter from Mr. J. B. Burnham in regard to the breaking of the game laws, hounding, etc., in Essex county.

I spent a considerable time in that part of the Adirondacks last summer and fall, and would like to certify as to the correctness of Mr. Burnham's statements.

On one occasion I took a forty-mile drive through the northeast portion of the county, and during that drive I distinctly heard hounds in full cry several times, and they were certainly not Game Protector (?) Beede's hounds of the law searching out game lawbreakers.

I do not think that it would be an exaggeration to say that a large number of the houses owned by natives, that I passed during the course of three months spent in the deer country, had their quota of deer hounds, to say nothing of licks placed in prominent runways.

H. B. WALMSLEY.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

The Secret of It.

Editor Forest and Stream:

"I never yet met with a sportsman who could tell me in what the sport consisted, who could resolve it into its principle and state that principle. I have been a great follower of fishing myself, and in its cheerful solitude have passed some of the happiest hours of a sufficiently happy life; but to this moment I could never trace out the source of the pleasure which it afforded me."

So wrote Dr. Wm. Paley, the learned philosopher and divine, a century ago. The many happy hours of his "sufficiently happy life" were all expended many years agone. His generation and the generations of fishes with which he was so happily associated have long since passed off the stage. Other generations of fishermen and fishes have played their brief parts in life's comedy and tragedy, and passed away. Their mortal bodies have in turn dissolved into their constituent elements, which may in turn have entered into the constitution of other fishermen and other fishes. And we, in this generation of fishermen and sportsmen, are left to grapple with the same problem that baffled the wise Dr. Paley and the sportsmen of his day—wherein does the sport of sportsmanship consist?

The question is one that cannot be answered in a word, nor in a dozen words. Still it is one that appears not to be unanswerable, as the wise old doctor seems to assume.

The sum total of that which goes to make up the enjoyment afforded by field sports is a bundle of complex elements, and it is the purpose of this article to essay the task of resolving these elements by the method of analysis into intelligible form, to "resolve it into its principle, and state that principle," and to search out the marrow that is within its bones.

First, the proposition is laid down that the pleasure which the sportsman enjoys from his day of sport in the field is derived chiefly not from the incidents of the day as they occur, but in anticipation, and in retrospection thereof.

The pleasure of anticipation must of course be based upon preceding experiences, else there would be no basis for the anticipation.

It is a common trait of human nature that pleasure is enjoyed more in anticipation than in realization, but the maxim that embodies this principle has a specially forceful application to the pleasures of the sportsman. As the day approaches for his "outing" the preparations to be made afford him pleasure. He confers perhaps with friends, who are to be his companions, about these preparations, in the course of which conference there are opportunities to expatiate upon the virtues of his gun and dogs or other appliances, and to swap reminiscences of former hunts or fishing excursions, all of which are sources of enjoyment.

This phase of the matter under discussion could be much amplified here, but every reader of this can readily clothe the above skeleton to suit his own fancy or circumstances.

Another element of enjoyment, both in anticipation and in reminiscent contemplation, lies in the possession of efficient appliances and in the care bestowed upon them, be they animate or inanimate, and in the feeling of affection that is engendered in the mind of the possessor toward these his pet possessions. His conscious ability to use these appliances with skill and effectiveness enters also as a factor.

Still another element of the enjoyment that a sportsman extracts from his sport consists in the matching of his skill and superior intelligence against the instinctive faculties of self-preservation—the elusive cunning of the objects of his pursuit, especially when he calls to his aid the instinctive proclivities of the dog, which has been trained by him to his service. Another important element in the pleasure of the sportsman consists in the acquisition by his skill and enterprise of something that is useful and desirable to possess, something to be exhibited with pride and shared with his family and friends. When the good and wise Dr. Paley wrote the paragraph that heads this article, if he could have recalled the feeling of boyish pride and exultation with which he displayed his first resplendent trout to his admiring mother and sisters, he could not have been at so great loss to "resolve into its principle" that mysterious and complex combination of feelings which we recognize as the pleasure of sportsmanship.

The writer can well remember now the feelings of exultation when, nearly fifty years ago, he brought home in triumph his first three squirrels, to be laid at the feet of his mother and to receive the plaudits of herself, together with those of his "cousins and his sisters and his aunts," without which there would have been no grand culminating moment at the close of this day of great achievements, and memory would not now cling with fond tenacity to that momentous event in his boyhood's career.

And now we come to that most important element of the enjoyment that is derived from field sports—the basic principle that underlies the problem and enters most largely into its solution, which is hereditary instinct. The same instinct that impels the dog to aid the man also impels the man to follow the dog. The human race was born and nurtured in the lap of nature. It passed a long period of childhood upon her ample bosom, receiving its sustenance from her generous paps. Nature provided man his larder and trained him in the ways to avail himself of her bounty. Like the domestic dog who no longer finds it necessary to pursue game for a living, but does pursue it with intense delight; like the household cat, who is abundantly fed by the hand of her mistress, but still pursues mice and birds for pastime and gives early lessons to her kittens in her own artful ways; like the horse, who still fears the spring of lion or tiger from the wayside stump, when all danger from such a source has long since passed; like the hog, who still summons his fellows to his aid by loud appeals, when attacked; like the cows, who rush together from all directions and with much excitement at the smell of the blood of one of their kind—so man, in obedience to the same instinct, easily forsakes the artificial paths of civilization and finds keen enjoyment and a sense of welcome freedom at the skirts of his first great mother—nature.

There are some men in whom this powerful underlying instinct, which tends to a reversion to nature's ways, has been largely leached out of them, or buried deep beneath the cares and demands or allurements of civilized life. Such men care nothing for field sports. But with the majority of us this feeling is easily awakened, and instinct resumes her sway.

The proposition was laid down above that the pleasures of the chase are more in the anticipation and retrospection than in the actual events as they occur. Let us examine this a little further.

Let us suppose that a day is appointed for a hunt of some kind. The preparations have been made and the day arrives. We get out of bed at an unwonted hour, eat hastily an unrelished breakfast, subject ourselves to much discomfort from cold in winter or heat in summer, suffer from hunger and thirst, undergo great bodily fatigue, suffer much worry and perturbation of mind from various causes, sometimes are exposed to serious dangers. Can any sportsman put his finger on any moment of such a day and say to himself, "I am now experiencing a sense of positive enjoyment—I now realize in this moment all that constitutes the great charm that lies in the chase"?

There are moments, to be sure, of triumph and satisfaction at success, but so intermingled with other and diverse feelings that it is impossible to block out any brief period of time in which we realize all that goes to constitute the pleasures and attractions of field sports.

Perhaps the most unalloyed and positive pleasure that we feel, especially when in the forest or on the stream, is in the sense of being "next to nature," with the exultation in freedom which accompanies that sense.

Another proposition was that the game or fish pursued must have value. No sportsman nor fisherman would feel much interest in pursuinig game or fish that was useless when secured, leaving an entire lacking of that sense of satisfaction in contemplating the results of a successful day, which constitutes so large a part of the pleasure that is in "sport."

To sum up the matter categorically, in conclusion, and define the elements of pleasure in field sports, to "resolve it into its principle and state that principle," the following array of elements is given:

1. Pleasure in anticipation.
2. Pleasure in retrospection.
3. Pleasure in the possession of suitable appliances and agencies, involving the exercise of skill in handling same, as well as emulation of, and friendly competition with, other sportsmen who have similar possessions.
4. Matching artificial weapons and human skill against natural instinct and cunning in a contest where pastime is the incentive on one side and survival of life on the other side.
5. The acquisition of trophies of value to be admired and shared by relatives and friends, involving a sense of manly effort made and skill successfully employed in such acquisition.
6. Satisfying a primitive instinct by an intimate association with nature, involving a consciousness of freedom from the artificial and conventional restraints of civilization, with healthful exercise, abundance of fresh air, and a happy condition attained wherein we realize the wish expressed by the great bard of Avon, "may good digestion wait on appetite," which is after all so large a factor in human happiness.

COAHOMA.

Charlie Shivel's Dream.

"I DON'T know that I could tell you if I tried just why fine old Sauterne, mellow and golden, always recalls Charlie Shivel to my mind, but it does and—well, Charlie, wherever you happen to be (and I suppose it's fishing, if you've half a chance), here's looking at you. We both have acquired, with some things that are worse, barren spots and fringes of gray on the crest of our intellectualites. The good things we like have most all gone back on us; our long tried livers rebelled seasons past—our doctors said gout, and we took to springs and what not, it's hard to say; but the truth is we are growing a little old, and we began doing it some time ago—only we weren't just certain of the fact—so few are, you know. Charlie Shivel? Why, of course you know him. I don't suppose there is a head of any big firm between Cincinnati and St. Louis, and from St. Louis to the Great Lakes, but does. One of the best generally informed men I ever met—a brilliant conversationalist, talks like a book upon every topic. But fishing is his hobby, and to hear him talk for an evening on that subject is almost as good as taking a vacation. A genuine lover of nature, an enthusiast. Why, his word pictures are greater in a minute than any artist's brush ever wrought. There is music in them too. You can hear the singing of the wild birds and the soughing of the wind among the trees, and the ripple, swish, ripple, swish, of the water as plainly as you can see the cloud shadows passing over it, and all the tints of tender springtime green, the warm flush of midsummer and the golden tones, with crimson blending, when the blue haze of autumn creeps over the hills—but you'd have to hear him tell it. Well, here's to Charlie again—and I am good for the next—if for twenty-eight years ever a better fisherman cast a fly in the park regions of Minnesota, or in any of the waters in that 'land o' lakes' up there. Yes, he's a born sportsman, I tell you—none of your three-pronged fishhooks for him; he is a gentleman every inch of him, even to fish. We have drifted apart, he and I; but there are times when I sit smoking here and you fellows are full of topics and interests that have gone ahead of me, when I think I'd give a fortune just to hear him tell of Bartlett's and 'the day's catch right off the point'; and what they had for dinner over on Spirit Island. But that always reminds me of something else, and then I begin to miss my slippers, forgetting the years it is since some one placed them by my chair. I begin to miss, God help me, most things—the little home of long ago and the little girl who, at my side, used to welcome Charlie to our fireside—that's what keeps us apart, makes us a bit cowardly—it's because we know we couldn't remember other things and forget the little grave where the water moans."

The old man puffed hard at his cigar; the old bachelor efilled his glass and looked as though he knew there was omething else to follow; the young fellow said, "Must ave been jolly old cove," and bent a pin into a fishhook nd looked as if he'd tie a string to it if no one was by to ee; the young married man moved in his chair uneasily nd then got up, said he had an engagement—I think he ay just have remembered that, perhaps, somebody had at slippers to wait beside his chair; any way he hurried ut. I saw the old bachelor smile, and so did the old an, but they were different—very different kinds of miles.

"Don't believe," said the old man, "I ever told you of harlie's dream—his fishing dream we used to call it. Vell, he had a friend living in St. Louis whose name as L———; a banker, I believe. He and Charlie had a iend in common, a clergyman, who don't figure except in ie dream. Charlie made an engagement to go fishing ith L. up at Minnetonka. They were to meet in Minnepolis on a certain Monday morning. That Sunday preeding that Monday Charlie had his dream. He dreamt at he had 'shuffled off his mortal coil' and found himelf, forthwith, in paradise, which he beheld as a fair, eautiful country not unlike, he claimed, his beloved ark region,' with hills sloping down to waters that miled and glistened and sparkled in the sunlight. He ould hear the splash and gurgle of brooks and streams. he air was full of wildwood fragrance. There were ady dells, and in the distance pleasant valleys, with a ver winding through. There was a deep woods too, with aths leading into its soft twilight, and groups of people ere and there in friendly converse. In the nearest one f these, Charlie saw his friend, the clergyman, who adanced to meet him, saying, 'Well, Charlie, you're a little te. Jo (meaning L.) has been waiting for you some me. And there he is now. See, coming through the oods there.' Charlie hastened forward to greet his iend, struck the while with the disconsolate expression f his countenance. 'What's the matter?' said he. 'Isn't ere any fish here?' 'Fish!' ejaculated L. 'Why, the lace is full of fish.' 'Well ——' resumed Charlie. 'But,' inerposed his friend, 'there isn't a single fishhook in the hole place.'

"All that day Monday Charlie Shivel haunted the depot t Minneapolis, scrutinizing the passengers as they lighted, but no L. appeared. Tuesday morning as he sat t breakfast at the West Hotel, at the same time reading is paper, his eye caught a paragraph that settled that reakfast. The friend he had been looking for had been ound, early Monday morning, dead in his bed. 'Had etired in his usual health on Sunday evening,' the paper tated, adding that it was supposed he died of heart isease.

"True? Yes, just as I've given it to you, and I'll vouch or Charlie's veracity every time. Perhaps it's because f his genial nature, his big heart and mind, perhaps it's ecause—— Well, whatever it is, there is something in he bouquet and something in the golden gleam of it, as I old it twixt me and the light, that makes me think of harlie—I think he called it 'bottled sunshine from the arm hillsides of old France.'"

"Here, waiter, bring another bottle of Sauterne," rdered the old bachelor.

"To-morrow night," said the old man, rising slowly rom his chair. "Good night." LAMBERT RUSSELL.

Curiosity.

WHEN the cold nights of the latter end of October had et in and the leaves were crisp underfoot, I decided to go and set up a line of marten traps through a stretch of green timber, between two large lakes. The distance was considered about eight miles.

I took an Indian youth as companion, for it is lonely work setting traps in the deep gloom of the forest alone. Our blankets, axes, two days' provisions, a square of cotton that we call a canopy, to keep off the wind, and my rifle, made up our necessary equipment, with a few baits to start work upon.

During the summer I had got an Indian to leave an old canoe on the shore of the big lake where we expected to come out; this would save our coming back on our tracks, as we could return by the canoe route, which was considerably longer, but much easier.

We worked away all the day we left the post, and when camping time came we found a pretty, sheltered place, the back of a large, flat-sided boulder. Ten feet in front of this lay a large fallen pine tree, against which we built our fire. Then we cut a lot of pitch pine dry wood in short lengths and split, ready to replenish the fire from time to time during the autumn night.

It is cheerful when one wakes during the night to have a bright blaze in a few moments.

The boy had worked pretty hard all day, and, after eating to repletion, rolled himself in his blanket and fell asleep. With me it was different. I lay back half-reclining, half-sitting, enjoying the congenial heat and wondering what luck we would have from the traps when we made our first visit. My rifle lay alongside of me on the balsam brush, with the muzzle pointing toward the fire, and, unconsciously my hand grasped the stock and my fore finger toyed with the trigger. I mention all these details to show how easy what followed came to pass.

The sparks had all gone out of the wood and only a bright glow remained, enough, however, to light up the trunk of the pine log and a considerable distance each side of the fireplace. All at once I heard the crushing of dried leaves and the breaking of twigs, at some little distance off in the forest. The sounds were evidently made by some large animal, and I soon realized it was coming slowly with steady steps toward the camp.

My first thought was to chuck on some fresh fuel to scare whatever it was away; but the next moment I decided to keep quiet and await developments.

With my thumb I drew back the hammer of the rifle and waited. I kept my eyes steadfast in the direction whence the sounds came, and in a minute (it appeared an hour to me) I saw the head and forequarters of an immense black bear, which stood gazing down on the camp from behind the fallen tree.

To raise my rifle and sight it point blank at Bruin's chest was the work of an instant. Crash went the bullet, true to the mark, and the bear fell backward, making the woods echo with its death roars.

The boy sprang to his feet in a stupid, bewildered way, asking what was the matter. I did not take time to answer him, being occupied in getting a fresh shell into the barrel, for one never knows when a bear is really dead. The safest way is to have your gun ready and stand off at a reasonable distance and wait until he kicks himself stiff. In this case, however, it was soon over with its bearship, for the bullet had gone right through the heart.

The joy of the Indian boy knew no bounds when he saw the result of the shot, for he saw many gorges ahead of him.

I had always been led to believe that smoke, or the blaze from a camp-fire, would keep away the denizens of the Canadian forests, and when I told this bear adventure to old hunters they simply listened and gave a polite smile.

In this instance it must have been a case of inordinate curiosity, accounted for in a manner from the fact of its being a female bear. MARTIN HUNTER.

Cowpunching as an Athletic Sport.

IN no part of the West is a ranchman's life such an ideal one as in California. In this land of flowers are no rolling prairies, with their ever-present dreariness, and portions of barren waste, but grand mountains and beautiful hills. The ranch house is usually tucked away by the side of some glade beneath the shadows of enormous oak and sycamore trees, a whirligig sprinkler sputters and splatters on its bit of green lawn and the air is filled with the hum of bees and other insects, while the cattle wander by hundreds in the broad cañon bottoms or over the flat surface of some far away mesa. The western fence is the Pacific Ocean, the eastern the Santa Ynes Range. Could anything be more peaceful or any climate more conducive to outdoor life and exercise?

It was the first day of the rodeo at Las Encinas. For many weeks R. and I had practiced throwing a riata with this great event in view, for this was to be our first experience at the real work of roping cattle. On this day we were to ride forth for the first time into an inclosed field to take part in a contest teeming with opportunities for grandstand plays, but yet open to "flukes" of a very dangerous character. By 12 o'clock the first drove had been parted out and corralled; by 1:30 dinner was over; by 2 R. and I found ourselves mounted and standing expectant and nervous before the corral gate. Then we chose partners. In corral work each man has a partner who, if he catch by the head, ropes the feet, and vice versa, for in this way a steer is thrown by both parties backing their horses in opposite directions. It was my good fortune on this occasion to fall into the hands of an exceptionally good vaquero, who was known to us all by the title of Doc, and his words as we entered the gate are still keen in my memory: "Take your time; don't get excited, and I'll see you through." But six or eight of us were allowed to enter, and the bars closed behind us with a snap. The cattle were huddled together on the further side of the corral and seemed to meet us with looks mixed with defiance and fear, while their low, subdued bellowing might easily be compared to the sounds heard between the halves at a Yale vs. Harvard game. But a few minutes of delay followed, in which every one tightened his cinch or shook the kinks out of his rope, when the boss said, "All right, boys. Let her go. Don't handle 'em too rough." Then came a sudden rush, and in an instant I found myself in a surging mass of cattle and horses. The dust arose in clouds, and the noise seemed like a menagerie let loose.

Doc was close behind me, and suddenly I was able to hear him say, "Snake that brown heifer! Snake that brown heifer! Quick, lad, quick!" Snake that brown heifer? Ye gods! There seemed to be ten brown heifers, and each one either ducking under my horse's belly or disappearing like a loon in that sea of animals and coming up far out of my reach. Nevertheless I aimed for one and threw. The rope fell just a little short, but it's always the beginner who wins the game, and in some remarkable way, just as the loop slid off that brown heifer's shoulder a little brown calf happened along and put his head through it. "Viva! Viva!" came ensemble from the audience (to whom both R. and I were the center of attraction, being tenderfeet). And even Doc, with a wink of one eye, said, "Well done, partner," as I drove my catch to a clear part of the corral, where he could get a good chance at the feet, and the brander could apply the iron. This took but an instant, and we were at it again. My next attempt proved far more exciting, for this time I managed to rope something "kind—er—bronco" (as the vaqueros would say). A nice lively fellow, who for two years had wandered the mountains and hills his own master, never having felt a rope and never having known a power of will superior to his own. This was real sport. The rope was no sooner thrown than the fight began. First it started in a series of fierce lunges and mighty pulls that caused my horse to squat low to the ground in his efforts to hold. Then began an exhibition of running and dodging first on one side and then on another, very apt to end when the riata came taut with El Torro sprawling in the dust, his wrath increasing, but his strength growing less. But at each halt I was able to take in a little slack line, until near enough to follow him with little danger of encountering the ropes of other men, and then, "Look out, boys! Here we come!" and out into the open space we came and within almost the time it takes to write it No. 2 was caught by the feet, branded and turned loose again. And so it went on. Now some fellow was in one sort of trouble or another in another. The sport seemed never the same, each successful throw developing a new series of conditions that followed each other in rapid succession, while the numerous (not to mention poor) attempts gave a continual impulse to "do better next time," which is a great proof of any sport's infatuation. As the number of unbranded cattle grew less and less things became more and more exciting, and finally, when one or two remained, none but the sharpest eyes could detect them among the ever-moving drove. When one of these "left-overs" was discovered it meant the signal for a general assault, as each man good-naturedly rivaled the others in the effort to catch him first. Finally the last brand was applied, and the day was over. The cool, sparkling water of a mountain spring bubbled in a trough not far from the corral, and both men and horses were soon enjoying its refreshing iciness, especially welcome after such violent exercise. Among these mountains and hills there is but little twilight, and as the darkness increased all gathered about the outdoor fire while the "round-up" cook prepared the evening meal. Then began that post-mortem sort of conversation which I had so often heard after football games and other athletic events. Each man had his history of the day and explanations for his own mistakes and those of his colleagues. After this came stories of past experience, and it was well on in the night when R. and I retired to our welcome beds to dream of this "king of sports" in the sleep only known to those who are able to do hard manual labor and from which it is a pleasure to be awakened by a continual knocking on the door and a voice in Spanish saying, "'Arriba! Arriba! Hace una mañana hermosa." LOUIS N. STOTT.

How I Was Lost in the Woods.

A FEW evenings ago at the club I told how I was lost in the woods of Maine this summer. When I had done one of my friends said: "That story ought to be published just as you have told it."

A man who has been in the woods as much as I have ought not to get lost, but I did it this summer. To find where the Bonnie Brook flows into the Dead River, where good fish are to be found, which seemed to be a secret, without telling any one where I was going, I went to find it. My plan was to follow the brook down to the river. Near the junction of the two I jumped the brook and lost my spectacles and could not find them. Having found the place I wanted, I started for home, and seeing an ugly clump of trees near the river, I went around it, leaving the brook behind me. I went up hill and soon found myself in burnt land with thick underbrush, many of the logs rotten, and they broke down under my feet. The mosquitoes and flies annoyed me very much. After a time I realized that I was lost. It was impossible to go many feet in a straight line without running into an obstruction.

After a time I lay down to rest my weary mind and body. In an hour, refreshed, I reasoned that I must make a strenuous effort to extricate myself from my position. I called at intervals for help, and once I thought I heard a reply. Finally, having taken my bearings, I made my way for a tall dead tree. Having reached it, I selected other bearings, and finally, to my delight, I found myself in a growth of large trees. Soon I reached the river and a man appeared on the other side and asked me if I was in trouble. I told him I had been. He told me the farm hands had replied to my calls, but I could not hear them, as the wind was in the opposite direction. Having reached a ford, the man crossed with his wagon and kindly drove me home in an exhausted condition.

There were two mistakes I made: First, I should not have gone far from home without having told somebody where I was going; secondly, I should not have deserted both river and brook. Also, I constantly underestimated distance. EDWARD L. PARKS.

Trees on the Western Plains.

LAST week we referred to the spread of trees on the Western plains which has taken place since their settlement. Other interesting observations on this subject are likely to be reported before long, and one of these, treating of the forest trees of Dubuque county, Iowa, will appear in the tenth volume of the Report of the Iowa Geological Survey.

In this paper Professor Macbride considers the forest conditions of Iowa of the past, when Dubuque county was practically a prairie, with narrow fringes of trees along the streams, and in a few other protective situations. He then goes on to say: "On the advent of civilization, the checking of prairie fires gave the forest here, as elsewhere, great relief. Young trees came up in every direction, partly from seed, partly from the so-called bench-grubs, old stump-like stocks which had been in the days of prairie fires again and again burned off, only to start in shoots and suckers with the advent of spring, but destined so long as fires swept over them never to attain tree-like dimension. These bench-grubs sometimes were very old and possessed an extensive root system. This accounts in part for the rapidity with which the forests of Iowa began to spread with the arrival of civilized man. In the case before us, the early farmers selected, of course, the more level country; the steeper and poorer hills were left to nature, and became quickly forested, covered with what is called second growth, an assemblage of trees denser and darker than ever occur in nature under any other circumstances. In Julien and Peru townships, some of these second growth forests may yet be seen which have been growing at least fifty or sixty years. So that the oft-repeated remark as to the number of Iowa trees, to the effect that their number has greatly increased since the country has been, is strictly true."

Oologists' Association.

AN association of oölogists has recently been formed, and it is hoped that it will hold a meeting in Washington in the autumn of 1900. The secretary of the association is Mr. Jno. W. Daniel, Jr., of Lynchburg, Va.

NOTICE.

THE New York Clearing House has adopted new regulations governing the collection of checks and drafts on banks outside of the city. This entails a collection expense on those who receive such checks. Our patrons are requested, therefore, in making their remittances to send postal or express money order, postage stamps, or check or draft on a New York city bank or other New York current funds.

Natural History.

A Nightingale's Outing in Brooklyn Streets (Sequel).

It was our privilege to watch Philomela's conduct out of doors for only a few more days. Taken generally, the even tenor of her way continued to run very nearly as already described. But her traits and demeanor as exhibited by her in detail afforded to us a subject matter for observation of increasing interest. Apparently she had planned for herself a mode of living suited to her present environments, and had settled down to carry it out in practice. That she had thus far maintained herself under such unfavorable conditions was a surprise to us. She certainly had thus far succeeded in her effort to make the best of the situation.

The little stretch of land, 80 feet long by 20 feet wide, comprising three courtyards, constituted the territory of our princess, and not an inch beyond its boundary lines was she ever observed to go, though she was often seen, when at either end of her domain, to rest exactly on the boundary line.

Between our premises and those of our next door neighbor to the right an iron railing stood on the northerly line of this strip; a viburnum bush grew near enough to the southerly end for some of its sprays to overhang the iron railing standing on the southerly boundary line. All this explains how we know. When she was observed to be only casually flitting about within the space described, she was in the habit of alighting on any spot she found convenient as a resting place; but when she was making her longest flights, which in spells she seemed to take delight in doing, these flights were taken back and forth from the viburnum at the southerly end of the stretch to the iron railing on the northerly end, near to which in the twilight we used to sit. In the morning and throughout the day, and until the sun sank very low, her searching for food was strictly confined to the limits of our own courtyard; but in the afterglow and in the twilight she extended the lines of the area in which she hunted in front to a line in the street 2 or 3 feet beyond the curbstone, at which stands the maple from which drops to the ground most of her prey.

Her hunting and feeding were never done on the branches of the trees or stumps, but always on the ground. Occasionally, however, she made a spring upward of 2 or 3 feet only, and picked while on the jump a caterpillar from a post, tree trunk or other object and then afterward ate it on the ground.

Since the first day of her outing, when, as we have mentioned she flitted from our third-story window to the branch of the maple in front, next from that to the mulberry, we have not seen her alight in any tree nor rest at any point at a height of more than 7 feet above the ground.

The tussock moth caterpillars had begun to weave their cocoons some little time before the first day of her outing, and consequently day by day their numbers diminished quite rapidly. And in as much as was their decrease in numbers, so also did her activity and effort increase the more in her search for them.

Then as her prey became quite scarce—which was very soon—she began to look first in wistfulness and next with eagerness for the viands we offered to her of mornings. She now partook of them with such avidity as to show that she was in quite good appetite.

Among the number of her feline foes, that with more or less frequency prowled through her territory, there were three that seemed to have marked her down as a prize for capture, particularly precious. These enemies were never observed to hunt in company, but any one of them in the absence of the others would lie in wait for or stalk her whenever chance offered. So great indeed was the persecution she suffered from this source that it was painful to us, and most pitiful, too, to witness it, we were so helpless to prevent. It interfered very much, of course, with her habits of feeding. In the morning, when we brought out her food, we had to stand on guard nearby until she had partaken of a good substantial breakfast.

It was singularly curious, however, to observe with what unvarying dignity of manner and placidity of expression she was possessed when in the presence of her enemies. Often, as she rested on a spray, when one of them came prowling within sight and near, and she was hardly, as it seemed to us, above his reach, she betrayed not the slightese emotion, nor even showed signs of consciousness of his presence. It may be because she had knowledge that she was safe from an upward spring from one of these ground prowlers.

In two instances that we witnessed one of these marauders approached and passed under a projecting spray of a loose shrub of scant branches and foliage on which the nightingale sat conspicuously in sight not more than 4 feet above her enemy's back, and neither of these creatures—at such deadly enmity—showed the slightest sign of consciousness of the presence of the other. But then also at other times as well, when she was busily feeding on the ground she showed no sign or knowledge of approaching danger from afar until it became so perilously near as to make the human onlooker tremble, and then, apparently with the greatest unconcern, as if it were her merest whim to do thus, she would flit away to alight at a safer distance.

In quite a number of instances some one or more of these foes of hers came within range of the watcher's rifle, and although it might be sighted upon the enemy he did not dare to pull the trigger for fear of a glancing bullet and consequent danger to some neighbor, passerby or other person that might chance to be within range. His vigils, however, as the shades of evening fell were still kept, and the hope that had sprouted in his breast, though not thrifty, had as yet not withered. And as our little heroine had thus far—wonderful as it seemed to us—escaped the many perils that encompassed her, we had hope—yes, even expectation—that she would in two or three days more return of her own free will to the shelter of her home—and ours.

The evenings were growing chilly; for her supply of food she was now depending mainly—almost wholly, in fact—upon the viands furnished each morning.

Verily, verily, it came to pass, as had been foreshadowed by the prophet, that the tussock moth crop was entirely exhausted. The search of the searcher was extended throughout the length and breadth of the principality, but none was found. Gaunt famine's hideous form ranged the domain of the princess and breathed upon the land his blighting breath. Marauders infesting the territory from hour to hour waxed fiercer and fiercer still. And the heart of King Pandion's loveliest daughter was sorely troubled, though in pride of her blood royal she permitted no shade of sadness to dim the luster of her radiant countenance. The duties of her ever faithful servitor became thrice multiplied, and the burden of them was heavy to bear. He likewise was a descendant through a long line—ancient and fusty—of heroes, and he bore the platter valiantly in these hours of trial. The zeal for spoils for which his ancient line was distinguished still survived in him, and gratitude for royal favors in expectancy stirred within him. In the book "L'Oiseau," as written by the great Gaelic historian, he had read, he now remembers that "blood and dreams" afforded the most fitting pabulum for a princess of her royal line, but in the bareness of the land he would ask himself, where was now the blood? And next, as he meditated, it came to his mind that some great writer had recorded that he had fed a princes of Philomela's kindred on "blood and the seed of the poppy"; but it likewise came to his mind that that prince did thereupon quickly languish and die.

The life of that prince would have clung longer to him, meditated the sage servitor, if he'd had nothing given him but fresh air and a perch.

And so it came to pass that he pinned not a shred of his faith upon that great writer, so true it is; also that the air that royalty doth breathe is tainted with suspicion.

High from the wall standing upon the boundary of Philomela's domain hangs Virginia's vine in graceful festoons, swaying with the breeze. Its five-leafed sprays have already responded in crimson glory to the magic touch of autumn's fingers. Its fruit in deeply purpling clusters droops, conspicuous by contrast, among the leaves. These clusters of fruit, fair to look upon, hang tauntingly before the wistful gaze of the gentle Philomela. But the princess knows that they would be as apples of Sodom—noxious in her mouth—for they are not yet ripe.

Rain must fall and frost must come to dye this fruit to a yet deeper purple before it is fitting meat for the feast of a king's daughter.

An enthusiastic pen is especially prone to be unruly betimes, and for the nonce, regardless of time and space, run away with itself before it can be checked and turned into the straight and narrow path of the story. But nevertheless and in spite of such detours this story has progressed to the morning of the eleventh day of our heroine's outing.

And this was of a Saturday, as it came to pass. This he well remembers, for he had previously agreed to a rendezvous on that day with a band of fierce-eyed mycophagists, who had nefariously planned for an incursion upon outlying jungles. Well, Philomela duly appeared in her accustomed haunts that morning; was breakfasted in the usual spot by the spirea bush, and then the chronicler departed to attend to other affairs. On returning home just before noon his eye in the sweep of its glance took in, as he entered the gate, first the dusky form of poor Philomela's most persistent enemy as he lurked beneath the wygelia, and next the form, trim and graceful, of our heroine herself, as she rested on an uppermost spray of the viburnum.

Comprehending the situation instantly, the chronicler quietly but quickly entered the house, and snatching up a rifle from its nook near the door, as he passed through the hall, he descended the stairs to the dining room. Having entered, he stepped quickly to the screened window, in front of which the wygelia was. Sliding the screen a little to one side so as to leave an open space, he sighted the weapon upon the lurker; he paused with finger upon the trigger and he did not shoot. He took aim again at another point of the lurker's anatomy, but did not pull the trigger. Again he shifted his aim to another point, the left, say, but he did not pull, nor dared not, though he fiercely desired to do so. The foe lay too flat to the brow of the terrace to make it safe to shoot, because of risk to some person or other in an opposite basement window, from any point of sight he could get on that cat. He then took a seat on a chair before the window and waited.

There was a trio of watchers now, and the minutes drew together into quarter hours. The man with the rifle whispered "pussy, pussy," in his most enticing falsetto, but it was of no avail; he imitated the faint squeaking of a mouse and gently scratched at the same time with a pin upon the woodwork by the side of the window, but that black imp in fur merely turned the least bit of the corner of a yellow orb toward the place from whence the sound issued. This feline seemed possessed of the philosophy of the stoics, except that there was surely a quizzical expression in the corner of that near yellow eye. The quarter hours drew on to half hours and the time to start for the incursionists' rendezvous was drawing very near.

Suddenly there fell upon the rifleman's ear the quick clatter of a pair of feet upon the pavement; then there was a bang-bang of the gate; next there was a glimpse of a russet-shod foot as it shot under the wygelia and the jump of a cat to escape a kick; then there was a glimpse of a grocer's boy with a basket as he swung around the side of the porch and down the basement steps; there was next a stumble and a dull sprawling thud—compounded of boy and basket—against the basement door; then quickly followed a loud half inarticulate shouting of "Oh! Golly! Gee-e!"

It took scarcely a moment for the chronicler to conceal his weapon; he made no stop for equipment, but started at once for the mycophagists' rendezvous, where he arrived fifteen minutes too late.

An engagement elsewhere prevented the keeping of the usual watcher's vigil that evening. The next morning—Philomela's second Sunday out—she failed to come for our greeting. Forebodings that some evil mishap had befallen her entered our hearts. The day ran its course without her appearance and our hearts grew sad. Our eyes have never since rested upon her and we mourn her as lost.

If the faithful chronicler had been romancing he might have penned a happier ending, and if he had been a better shot, then in fact there would have been two endings, and the last end in that case better than the first.

It gives me pleasure to say that while I am penning it now, on Thanksgiving Day, the melodious strains of a nightingale have been and are at this moment filling my ears. These are the strains of our Phil, so nicknamed to distinguish him from Philomela, whose companion he was.

This is the ninth yearly recurrence of Thanksgiving Day he has spent with us. His extra feasts for the holiday comprise a double allowance of meal worm—for turkey—and the berries of the Virginia creeper, now plucked ripe, from the vine that hangs upon our front wall—for cranberry sauce.

His strains are expressive of health and of the happiness he feels.

This Phil, I may further mention, was the nightingale that the poet naturalist of Riverby, who writes like an angel and talks like an archangel, heard sing on a bleak November morning three or four years ago.

And it was just after our friend had failed to hear a nightingale's song in his quest for it, as he has told, while on his visit to the country of good old Gilbert White, of Selbourne, our friend's prototype, who knew how to observe and then write accurately of what he had seen, and who never therefore could have been guilty of writing such nonsense as to say that "blood and dreams" or blood and poppy seed would form a mixture fit to nourish nightingales.

THOMAS PROCTOR.

BROOKLYN, N. Y.

The Panther's Cry.

Editor Forest and Stream:

Over the nom de plume Juvenal a writer in your issue of Dec. 16 speaks of the animal known in the Eastern, Middle and Valley States as the panther, and beyond the Rockies as the mountain lion, not as a howling success, but a "screaming terror." I infer from his article that the editor also holds to the idea of "screaming and man-hunting panthers."

I have been hunting in the wilds of the Indian Territory and further west for twenty years, in the haunts of the cat or felidæ family. I am tolerably well acquainted with the great big yellow coward, and have heard many times his "lonesome and deceptive cry." I have no more respect for him than I have for his human counterpart, the Digger Indian. There is no question but he makes a noise, and that to the imagination of those who have been fed "upon the traditions of the past and the lullaby stories of childhood" his dismal cry, especially at night, when alone in the woods, sounds human. Surroundings sometimes change a sound as well as a view. In the first place, the panther, or mountain lion, as it is called further west, is only a larger cousin of the common house cat. Any yellow tomcat is a miniature panther, even to vocal ability, which is abridged only by his smaller anatomy and the mellowing influences of his naturally ferocious nature by the domesticity of his ancestry.

Your purring pet Tabbie, if turned adrift in the wilderness to "root kittie or die," will naturally take to the ways and mode of life of his overgrown relative, the panther or mountain lion. Then his caterwaul, which, when he was prowling around at "the ghostly midnight hour" when living a pastoral and quiet life, produced profanity, bootjack bombardments and insomnia, would cause the ice to form along the spinal column of the timid and belated hunter and convince him that the cry was like that of a "woman in distress."

From my experience "distance lends enchantment to the view" that Juvenal and the editor hold and causes them to adopt the theories of those who said "the panther screamed and attacked man." I have heard the panther at the distance, supposably, of a mile, and when he was but a few yards away, and his cry is a perfect duplicate of the sound Tommie makes when he starts out to "make a night of it."

It is simply a loud caterwaul, and it is the only sound I ever heard one make, except the mewing that is common and often heard to emanate from the fireside pet.

Had Juvenal and the editor been with me three weeks ago they would quickly agree with me that there is no scream in the panther's cry, when all of the cry is heard. I had journeyed further away from camp than I anticipated I would go when I started, and when I had found and killed a good-sized buck I concluded that as night was upon me I would camp and carry my game in in daylight. I hung the carcass up, and in the ravine near it I built a fire, "jerked" some of the juicy meat and made my supper. After having satisfied my appetite, I made a bed of leaves and branches and prepared for a nap. While lying there watching the flames and thinking away up the mountain I heard a "scream," I knew what it was instantly, and knowing the nature and habits of the animal began speculating on my chance of securing his pelt. Possibly every three minutes he would do that scream, all the time approaching my position. As he came nearer the "scream" vanished, and there was the pure tomcat, sleep-destroying sound that every denizen of our cities and villages has of times heard.

The fine treble of the caterwaul at a distance is not heard, only the coarser tones at the end of the "waul" when the distance is too great. As he approaches all the notes of his song are heard and there is not a semblance of the "scream" in it. This cat came up near enough for me to hear him crunching the leaves with his velvet-shot feet, but he was careful not to expose himself to view. He had no business to transact with me, but had come solely for the purpose of dining off the choice venison that his acute sense of smell informed him was there.

He is a great big, cowardly brute, with all the characteristics of the human bully. Like his counterpart, the house cat, he will climb a leaning tree and watch all day for an unwary deer to pass, when he will pounce upon and kill it. Possibly, were a hunter to pass where he was

watching, and the animal did not realize that it was a human being, he would jump and there might be some raiment torn and nether garments soiled. But it would be "hoss and hoss" which suffered the most from fright. He is easily killed, and I think there is no animal that lives in our forest that is as easily disabled as the panther. His flesh is as soft as mush, and I verily believe that one could, with a .22cal. target rifle, shoot the largest of the kind through, from "eend to eend." He is a sneak, and the greatest coward that preys upon our game, and the smallest poodle can frighten him so that he will climb the highest pine. If Juvenal and the editor will put in an appearance about Dec. 1 next at some station on the Pittsburg & Gulf road, I will agree to lead them to a point where a night in the woods will convince them that the panther's scream that our fathers tell about has gone entirely out of fashion. Cut the tomcat's caterwaul in half and listen to the latter part of it and you will have the scream the "ancients" tell about.

"Get close to the bird and the scream is not heard."

Weir City, Kan.

The Bird Fauna of "The Lake."

At Lincoln, Neb.

A few miles west of Lincoln is a small lake about three-quarters of a mile long and half a mile wide. Altogether it covers probably 200 acres. The banks slope gradually to the water and in most places are scantily covered with short grass and sedges. The water on the average is between 2 and 3 feet in depth. This lake is called either "The Lake," or, in polite society is known as Burlington Beach.

The Lake is semi-artificial and semi-natural—semi-natural in the fact that there always was a natural sink or hollow, in which there was more mud than water, and artificial in that a dyke was necessary to keep the water in. This dyke is only a few feet high and about a quarter of a mile long. At the upper end a short channel connects with the creek and allows the water from the creek to flow into and fill up the lake. The water is very salty and does not support much plant nor animal life.

During the spring and fall migrations of the water fowl The Lake is one of the most attractive spots in this section of the State for the birds. At these seasons there is not a time but when one may see one or more flocks of ducks or geese. Formerly a number of the birds bred in the immediate vicinity, but now there are very few that do. Some of the sandpipers stay till the middle of July and August, but do not nest. Some even stay till the first of the fall migrants arrive from the north.

There is so little concealment for the hunter that the birds find it comparatively easy to keep out of range. Most of the shooting is done from boats or from blinds. The best record for the season just closed was made by two local gunners, who in six afternoons from a boat killed 157 ducks of various kinds. The most for any one afternoon was forty-four. On days when there are few hunters about there are sometimes as many as 4,000 or 5,000 birds on the water in one flock.

The following is a list of the birds collected by myself and other ornithologists in the immediate vicinity of The Lake:

3. Horned grebe—uncommon.
4. American eared grebe—frequent.
6. Pied billed grebe—common.
7. Loon—infrequent.
36. Pomarine jaeger—very rare.
51a. Herring gull—rare.
54. Ring-billed gull—uncommon.
58. Laughing gull—uncommon.
59. Franklin's gull—common.
60. Bonaparte's gull—uncommon.
64. Caspian tern—very rare.
69. Forster's tern—rare.
70. Common tern—rare.
74. Least tern—infrequent.
76. Black tern—common.
120. Double-crested cormorant—rare.
120a. Florida cormorant—rare.
125. American white pelican—uncommon.
129. American merganser—rare.
130. Red-breasted merganser—rare.
131. Hooded merganser—frequent.
132. Mallard—common.
133. Black duck—uncommon.
135. Godwoll—common.
137. Bald pate—common.
139. Green-wing teal—very common.
140. Blue-wing teal—very common.
141. Cinnamon teal—very rare.
142. Spoonbill—very common.
143. Pintail—common.
144. Wood duck—frequent.
146. Redhead duck—frequent.
147. Canvasback duck—frequent.
149. Lesser bluebill—frequent.
150. Ring-neck duck—very rare.
151. Golden-eye wheedler—rare.
152. Barrow's golden eye—very rare.
153. Buffle head—common.
163. American scoter—very rare.
165. White-winged scoter—very rare.
166. Surf scoter—very rare.
167. Ruddy duck—common.
169. Lesser snow goose—frequent.
169a. Greater snow goose—frequent.
169, 1. Blue goose—rare.
171a. American white-fronted goose—rare.
172. Canada goose—frequent.
172a. Hutchins' goose—frequent.
180. Whistling swan—rare.
181. Trumpeter swan—rare.
190. Bittern—common.
191. Least bittern—rare.
194. Great blue heron—frequent.
197. Snowy heron, very rare.
200. Little blue heron—very rare.
201. Green heron—common.
202. Black-crowned night heron—common.
204. Whooping crane—rare.
206. Sandhill crane—rare.
212. Virginia rail—uncommon.
221. Coot—very common.
223. Northern phalarope—uncommon.
224. Wilson's phalarope—common.
225. American avocit—infrequent.
230. Wilson's snipe—infrequent.
231. Dowitcher—infrequent.
232. Long-billed dowitcher—infrequent.
233. Stilt sandpiper—uncommon.
234. Knat—very rare.
239. Jacksnipe—uncommon.
240. Bonaparte's sandpiper—common.
241. Baird's sandpiper—very common.
242. Least sandpiper—very common.
243a. Red-back sandpiper—rare.
246. Semi-palmated sandpiper—very common.
248. Sanderling—rare.
249. Marbled godwit—infrequent.
251. Hudsonian godwit—infrequent.
254. Greater yellowlegs—frequent.
255. Lesser yellowlegs—common.
256. Solitary sandpiper—uncommon.
258a. Western willet—uncommon.
261. Bartramian sandpiper—frequent.
262. Buff-breasted sandpiper—frequent.
263. Spotted sandpiper—uncommon.
270. Black-billed plover—uncommon.
272. Golden plover—uncommon.
273. Killdeer, common.
274. Semi-palmated plover—frequent.
277a. Belted piping plover—rare.
283. Turnstone—very rare.

J. S. Hunter.

Lincoln, Neb.

Mastodon Tooth on Staten Island.

Last summer, while certain improvements were being made in the Moravian Cemetery at New Dorp, S. I., a swamp which occupied a morainal basin was drained. After the water had flowed off the muck of the bog was dug out, and while this was being done there were brought to the surface a number of vegetable and animal remains, which show that this morainal basin long ago contained a considerable pond.

As the excavation went forward, the decaying vegetation of the upper layers of the soil was taken out, and below this was found 5 or 6 feet of fine mud, which contained the trunk and branches of trees. Still below this was a black, sandy silt, stratified, which contained cones and twigs of the white spruce, a tree which at present is not found further south than northern New England and the Adirondacks. Below these cones, and about 23 feet from the surface of the bog, was found the molar tooth of the mastodon.

In connection with the spruce cones already referred to was found a considerable amount of charred wood, presumably indicating the presence of man.

Prof. Arthur Hollick, who announced this discovery to the section of biology to the New York Academy of Sciences, concludes that the deposits now disturbed were laid down in still water in a continuous and unbroken series of layers, and inasmuch as it was in the morainal basin, the laying down of these deposits must, of course, have taken place after the moraine was formed. "The probabilities are," he says, "that a pond was formed in the morainal depression immediately after the recession of the ice sheet, and that this pond was a receptacle for silt, dust and decaying vegetation ever since; the accumulations finally filling it up and converting it into a swamp with a little pool of casual water in the middle."

A Loose Alligator in an Animal Store.

An alligator, 8 feet 8 inches in length, caused consternation among patrons and employees in a wholesale animal and bird store on Market street last evening. The animal attacked one of the employees at a time when several women customers were in the store. Although the cage is strong, the alligator succeeded in forcing the iron fastenings. The employees rushed toward the door, shouting to the customers to follow them. The women became panic-stricken, and several of them had to be carried or dragged from the store. No sooner had the alligator made its appearance than a howl went up from the monkey cages. The alligator started toward a cage in which were two large baboons, and, despite its iron bracing, the reptile's mighty jaws demolished it in short order. One of the baboons attempted to get away, but it leaped directly into the jaws of the alligator, and the next instant its life had been crushed out. The other baboon made no effort to escape, and before the attendants could prevent the reptile had killed it also.

The uproar made by the other terrified animals disconcerted the alligator for the moment, and the attendants, who had by this time been reinforced in numbers, started in to capture the saurian. A noose was thrown over the animal's head and securely fastened. A similar noose was fastened about its tail, and it was securely lodged in another cage. While this was being done the reptile's tail struck one of the employees and knocked him against a plate glass case, shattering it and cutting him on the hands and face.—Philadelphia Ledger, Dec. 6.

An Illinois Gray Wolf.

Springfield, Ill., Dec. 10.—*Editor Forest and Stream:* The capture of a gray wolf in the vicinity of this city is quite a rarity, and excites considerable interest. Saturday, Dec. 2, while a number of hunters were ranging the woods east of Chatham, about nine miles from here, an undersized gray wolf, evidently a young one, was discovered. When cornered he fought fiercely, and suceeded in killing a hound belonging to one of the hunters, before being captured. The animal was brought to this city, none the worse for his fight, and is now on exhibition in the window of a cigar store. T. M. S.

The Forest and Stream is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

Museum of Science and Art.

On Wednesday, Dec. 20, the Free Museum of Science and Art of the University of Pennsylvania was formally opened, and the president and Board of Managers of the Department of Archæology and Paleontology transferred it to the provost and trustees of the university. On the same day the Dr. William Pepper Testimonial Committee, through the Hon. Geo. F. Edmonds, presented to the provost and trustees of the university the completed statue of the late Dr. Wm. Pepper, which was executed by Karl Bitter and recently erected on the museum grounds.

Camp-Fire Flickerings.

"That reminds me."

Pat O'Brien's Rabbit.

A few years ago a farm in my neighborhood, on which there was some good shooting, changed owners, and naturally I felt like cultivating him in such a way as to still keep my former shooting privileges. He moved on the place in the fall, and a few days afterward I drove along the road and found him husking corn, so I stopped, and introducing myself, asked whether he would sell me some corn. He proved to be a genuine Irishman, one of those good-natured, cheerful fellows who at all times overflow with good nature and ready humor. His face was a map of Ireland, and his brogue was Irish too, and a rare rich brogue it was. After fifteen minutes' talk with him, about various agricultural matters, but none about the shooting, which was really what I stopped to talk about, I started on, but after driving a little ways stopped and said: "By the way, Mr. O'Brien, I sometimes go quail shooting. If I should happen to be over this way some day would you have any objection to my shooting on your lands?"

"None at all, sor. None at all," said he. "Oi want to be a naybur and to have nayburs. Come as often as ye loike an' shoot all ye can foind. Oim not goin' to have any of thim dudes an' town fellies huntin' an me, but Oi don't care for a naybur huntin' all he playses, an' good luck to thim whin they come."

"Thank you," said I, "and do you like rabbits?"

"Sure an' we do. But we've no way av gittin' the craythers."

"I'll see that you have some when the snow comes."

"Thank you sor. Oim thinkin' we can ate all that you'll be able to bring us, said he, with a merry twinkle in his eye that said, "It's shtarvin' we'll be entoirely, if we daypinded on you for mate."

When the snow came I one day wandered across the fields to Pat's, picking up half a dozen rabbits on the way.

"Be the sowl av St. Patrick, but thot's a foine lot of aitin'," said Pat. We have had but wan rabbit the sayson so far, an' it was moighty nigh we came to not havin' thot."

"Tell me about it," I said, for I knew Pat had a story to tell.

"Well," said Pat, "it was the mornin' but wan afther the fallin' av the snow, an' Kelsey Ryan, him thot lives in the village, he was coomin' along the road, and matin' a rabbit track comin' across the road, he follied it, and located it, sittin' undher a bit of grass out in the falde, a short distance frum me house. Kelsey havin' no gun with 'im, barrin' a broom he was carryin', an' Oi do'no what he should be carryin' it for, he called to me to bring the gun and shoot the rabbit, an' me havin' no gun, an' spyin' wan av the nabor byes crossin' the meadow with a gun, Oi called to him to coom over, an' whin he got there, Kelsey said: 'Let me thry wan shot at him wid the broom, an if Oi don't get him, thin ye can shoot him all ye loike.' So Kelsey thried him wance wid the broom, but the spalpeen takin' the brush ind av th' broom, it was no good, seein' th' rabbit was sittin' down dape into the snow, as anny sinsible rabbit would. Thin, whin the rabbit ran away, the naybor bye wid the gun foired at it twict, an' both av the toimes he fired he didn't hit it. Aftherwards the rabbit ran undher my house, and was annybody's rabbit, for nobody cud get 'im. Well, in about two hours there coom a shtrange cat an' got undher the house, an' as Ellen was sittin' forninst the cook stove, nursin' the baby asleep, roight oop through the floor undher where Ellen was sittin', there coom a sound of squallin' an' a bumpin' an' a poundin' against the floor till Ellen dhropped the baby, an' retrated out into the yard, an' she says, 'Howly blazes, Pat, an' phwat is it Oi dunnow.' 'Begobs, an' it's thot dirthy baste of a cat aitin' the rabbit aloive,' sez I. An' perhaps ye won't belave me, sor, but the rabbit come out from undher the house wid the cat houldin' to it wid the fate av him, an' he was aitin' the rabbit wid his tathe as they wint. Do you moind thot big black dog of moine? The wan Dinnis Rafferty, me father-in-law, presinted to me a year agone nixt Easter. Will, the dog was round the corner of the house, beyant where they wor comin', an' the dog scatthered the cat wan way an' the rabbit another way, an' thin pickin' up the rabbit, he was makin' off wid it, till wan of me byes was afther takin' it, but the dog was not for lettin' 'im have it at all, at all, till Terrence took 'im by wan ear an' Michael by another, an' Peter got hould av wan fore fut, an' Dinnis another, an' Jimmy got him by a hind fut, an' Matt by another hind fut, an' little Pat, seein' help was naded an' no other place to take hould, Pat took 'im by the tail, an' wid Lawrie hould of the rabbit, there was such pullin an' haulin' as wud have did your heart gude to see."

Here the story was interrupted by Matthew, who was reading while his father talked. "Daddy," said Matt, "what is a phenomenon?"

"A fanomenon is it?" said Pat, scratching his head. "A faynomenon, Matt? Do you moind the big sycamore three shtandin' down in the meddy?'

"I do," said Matt.

"Well, said Pat, that three is not a faynomenon. D'ye moind the ould cow thot's been on the place for tin years agone?"

"Yes," said Matt, "but wot's that got to do with it? I want to know what a phenomenon is."

"Aisy now, aisy," said Pat. "That cow is not a fay-

nomenon, aither, but whin you see thot cow climbin' thot sycamore three, tail fornists, thot will be a faynomenon."

O. H. Hampton.

On the St. Francis.

To his notes on "Quail Shooting in the Blue Ridge," Mr. Lowry adds:

Since writing the above I have received a letter from a friend who has for a number of years past been trying the birds 'way down in Mississippi. As he mentioned an experience of his near McComb City, where he stopped at a house in which many of the window panes were missing, and upon inquiring of the owner why they weren't replaced, he was informed that "he hadn't time to do it" (although he had been living there about seventeen years), this put me in mind of a little experience of mine in Arkansas which perhaps may be worth telling.

About ten years ago I happened to be in Memphis, and as I heard that there were a great many ducks over on the St. Francis River, about forty miles from Memphis, it did not take me long to get there. Well, I struck it in a blizzard, and found myself lodged at what by courtesy was called a hotel. This hotel had only one room for guests. There were three double beds and a large fire. I have always thanked heaven for that fireplace, for had it not been there I believe we would have frozen to death. Of course there were three or four windows in the room, each and every one of which had one or two panes of glass broken out, and the way the icy wind did whistle and roar through them was a caution. When I came to retire I found that I had five companions, some of them pretty rough looking fellows, none of whom I had ever seen before, and as we were all six of us expected to sleep in the three beds, we paired off accordingly. As I knew pretty well that we were going to have a freezing night of it, I went to bed with all my clothes on excepting my boots, and I believe my companions did likewise. After a useless effort to keep warm, I finally arose and informed my companions that I was going to stand guard and keep the fire going for a two hours' watch, and should expect them to divide up and do likewise, which they agreed to, and in that manner we managed to pass the night. The next morning the landlord appeared, and of course asked us how we rested. As we none of us felt very good, one of our party replied in a pretty grave and surly voice, "Darn poorly."

"How is that?" said the landlord.

"Why, look at those infernal window panes! If we hadn't have stood guard, and kept that fire going all night, we would have frozen to death! Why don't you put some glass in those window frames anyhow?"

"Oh, it's too cold," said the landlord.

"Well, why don't you repair them when the weather is warmer?"

"Don't need it then," said the landlord. "You fellows don't know how to make an Arkansas window pane anyway."

"Why, how do you do it?" asked somebody.

"Why, stuff your breeches in," said the landlord.

In a little while breakfast was announced, and our half-frozen procession wended its way to a little outhouse made of boards, not tongued and grooved, nor sheathed nor battened, and each and every board had shrunk about half an inch from its neighbor, and as the door was left wide open, and neither of the two windows had any sash in whatever, with a temperature of about 20 degrees, we certainly had a cold breakfast. Now it so happened that the flooring of the little room had evidently been laid down green and left to season, and as not a nail had been put in it, the loose boards made rather a shaky floor. As I was trying to swallow some of their corncob coffee and cold pork, I felt a commotion under the floor directly beneath my chair—the loose boards were shaking and raising and falling. Of course I turned to the landlord and calling his attention to it asked him what it was. It did not take him long to enlighten us, for he seized one of those old-fashioned two-pronged forks in his right hand, and leaning over with it he thrust it through one of the cracks in the floor as far as it would go, whereupon there was a tremendous racket, with all sorts of squeals, and the landlord still leaning over and holding the fork which had passed through the floor, lifted his voice and thus addressed us: "Gentlemen, I wish to inform you that I don't allow any darned hawg to scratch his back under this hotel."

Robert C. Lowry.

Paragraphs and Postscripts.

From a Man in Boston.

I passed yesterday a couple of deer and a bunch of partridges and a few duck hung up in the door of a restaurant, and it just gave me a convulsion. It seems as though I must pack off for the Maine woods instanter, but I cannot do it, and thank you for your sympathy, which is about my only consolation, save that I do get Forest and Stream, and out of it, as I have often told you, more comfort and recreation than from everything else that comes to my desk.

His Philosophy.

Wud ye be afther sayin', Denny,
Th' m'anin' uv yer way;
Ye kapes yer dog a-slapin'
By yer fire the night an' day?
Don't yer know he'll live the longer
In th' cowld an' crispy air,
Than snoozin' on yer carpet flure,
An' sheddin' dirt an' hair?

Now, Mike, ye may be spakin' sinse,
An' I be showin' crazy;
Better his loife be short an' swate
Than long and rale onaisy.

E.

The Forest and Stream is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

Game Bag and Gun.

The Big Buck of Witch Lake.

The annual visitor to the Upper Peninsula of Michigan will note a good many changes as the years roll by. Your Uncle Sam's family is increasing in numbers very rapidly, and ere many years more the wilderness will blossom like the rose, and the wild man and wilder animals that possessed this domain a century and a half ago will be known only in history. Some ten years ago the penalty for losing in a game of pedro (a favorite evening pastime in some hunting camps) was that the loser had to take 40 acres of land in that country. Now that land is selling at from $5 to $10 per acre, and cordwood brings $4.25 per cord at Republic. It is only a question of a few years when all the hardwood and pine will be gone from lands adjacent to the railroads and considerable of the land will be cultivated. The soil is thin, but rich and dry. The country is dotted all over with lakes, the waters of which are soft, pure and cool. There are now four families located at Witch Lake, and at Witbec, two miles north, there are a few clearings. A land company is cutting timber here, and there are some lumber camps at points west reached by a wagon road that extends thirty miles through the forest. These wagon roads are corkers. A companion and I took passage on an empty supply wagon returning from a camp on this Witbec road a few years ago, and managed by main strength to stay in the wagon. When it was not trying to spill us out behind as it crept up hill it was either in imminent danger of upsetting or following the galloping horses down hill, every now and then striking a rock or deep rut, from which it would bound into the air a foot or more. On some of these roads, however, one may strike a level stretch that will allay his suspicions and soothe him to drowsiness if wearied from a long tramp or continuous watching; but ere long he will be rudely awakened, for something will rise up and smite him.

We set our tents this year in the little cove at Witch Lake, a place I have partially described in the past. I had for companions my old friends N. H. Gable, of this city, and George Hedrick, of Fort Recovery, O. These two old soldiers are sportsmen to the core, and an outing means something more to them than the simple slaughter of game. We made our arrangements for the trip with less deliberation than usual, not even deciding to go until Nov. 8, and left here at 12:29 A. M. on the 10th, arriving at Floodwood, Mich., at 8:45 A. M. on the 11th. At this station, which is four miles south of Witch Lake, I ran forward and climbed on the engine, so I could select the best vacant camp site and at the same time point it out to the engineer. As I clambered into the cab the train pulled out, and if the engineer and fireman thought me cheeky they held their peace and waited for me to introduce myself and my business.

As we rounded the last curve at Witch Lake I saw that our first choice was awaiting us. The ground was covered with a heavy coating of grass that lay flat and didn't wear through during our stay. We had our baggage unloaded in a cut in a little ridge, and had to carry it only about twenty steps down into the hollow. We had our tent up, baggage inside and fire going before noon. We drove stakes on the outside of a frame of small logs to hold them in place, then filled the frame with earth and set our bottomless stove on this. Thus the stove settled into the earth and prevented fire from escaping, and was elevated to the right height. We made a wide bed in the same manner, except that we filled the inside to a depth of a foot with balsam feathers. We had to turn our bedding crosswise, then use two pieces for the length, lapping them, in order to cover the bed fully. This bed was very alluring. It contained warmth, room, flexibility and fragrance, and was one of the most pleasant dreams of this delightful outing.

> For what care we for all the wealth
> That man can gain by toil or stealth
> When we have lost life's blessings - health and happiness?

It was health and happiness we were seeking—a rest from the worry of everyday business cares—and at the same time a change of air and scenery.

When the camp was put to rights and the afternoon was speeding by we concluded to have for supper potatoes with the jackets on, but, lo and behold! we had forgotten potatoes. In our hasty preparation we had mentioned that we were going to a potato country, and there the matter was dropped. Mr. Layton Jay, with seven companions from Boone county, this State, was in camp nearby, so I called on him to borrow a small measure of potatoes until we could procure some from a settlement or town the next day. He received me as only a sportsman would, and not only met my request, but gave me a portion of the hindquarters of a deer and declined any pay or repay. When Sunday morning dawned I was glad it was so, for I didn't want to do anything but just rest. No so Hedrick. He was hopping around like a pine squirrel, and no sooner was breakfast over than he wanted to see the lakes and woods.

The first week sped by, and although I hunted as faithfully and intelligently as I ever did I neither saw nor heard a deer in all that time. I shot the heads off of three partridges, and could have killed more, but I was licensed to hunt deer, and our camp needed meat. Fowl, though good and all right, wouldn't do in this case. Hedrick and Gable killed some grouse and rabbits, and caught several strings of perch. Mr. Jay's party was getting a deer or two nearly every day. Three or four of the party would go up or down the railroad a mile or so, then follow a trail out into the woods, where they would form a skirmish line. A like party would start a few moments later, turn into the woods near camp, form a line and hunt toward the first party. Sometimes the members of one party would station themselves along the edge of a thicket or swamp, and the other would beat their way through. By invitation, I joined them the latter part of my first week, and got a stand nearest the Michigamme River, at the north end of a thicket. There were plain trails entering the thicket, and fresh sign in the trails. Before four members of their party and I got stationed we heard the other party shooting about a mile down the river, and fully expected to be compelled to kill something to avoid being run over; but, although the fellow who came along on purpose to beat the thicket came my way, making as much racket as possible, all the deer that were jumped slipped out to one side or the other. We didn't get any, and I did not attempt to go with them again, for fear I might prove a hoodoo.

The first of the second week came, and Hedrick said he would go up the railroad three-quarters of a mile and go out east along an old trail. I turned in a trail that left the railroad about a quarter from camp, then hunted north, intending to strike a burned section at a point where a ridge extended into the green open woods. I knew some of Mr. Jay's men had gone up the railroad a mile or more, and might head a deer my way. I struck the place and walked up an old pine log and took a stand on the stump. From here I could see south, east and west, also northeast and northwest, as far as my gun would carry, but directly in front, or north, the ridge was covered with tall, dense brush. I had been there less than thirty minutes, when I heard the report of a gun west of north from me, and about half a mile distant, and a moment later a large buck appeared to the left of the ridge in front of me. He was about 200 yards distant when he came in view and stopped to listen and survey the open woods in front of him. There was too much brush between him and me to justify the risk of a shot, and as the ground in front of him was more sparsely covered and he was headed that way and did not seem aware of any lurking danger I simply took hold of myself and waited developments. But it was pretty trying after a whole year chained to business and a whole week in a deer country without seeing a deer. I had time to recall telling Forest and Stream that I never had had the shakes, and all the time that buck stood there looking into the woods. His range of vision no doubt took in all the woods from the ridge on which I stood to the portion on his right, which he had no doubt carefully scanned before he came to the point where he stopped. It might have been the elevation, or my old green coat, or just my change of luck that kept him from discovering me and darting back behind the brush-covered ridge. When he did move he did what I was waiting for—he simply walked straight ahead until his body showed in the open, and then I bleated and brought him to a sudden stop.

Three seconds later, as my gun roared his death knell, he whirled and bounded off behind some standing timber, and I got only a momentary glimpse of a gray and white streak. Though I was ready for another shot in an instant, before the smoke from my gun scattered he was out of sight and hearing, and as I strained my eyes and ears I said half-aloud: "Is it possible that I missed him?" He had time to run about half a mile, when I heard from that direction three shots in rapid succession, and then I was more than half convinced that I had missed him. I stood there on that stump for fifteen or twenty minutes, hoping against hope that another one would come my way, and all the time reproaching myself for bad shooting, bad luck or anything that caused me to lose that big buck. For a big one he surely was, though I sized him up at fully 150 yards.

But most things have an ending, and when I had lectured myself as much as seemed justifiable, I slid off the stump and down the hill, going around a hollow or basin some 30 feet below the line the ball from my gun made, and reached the spot from which the buck had disappeared. By careful search I found three hairs or parts of hairs. I knew then I hadn't missed him, and started on his trail with renewed interest. I had gone but a few steps before becoming convinced from the zigzag, irregular trail and overturned chunks of wood, broken brush, etc., that the buck had been hit hard, and within 200 yards of where he had stood I found him dead. And now I saw for a fact that he was a big one; and I also saw that what I had been condemning myself for as a bit of bad shooting was in reality the very thing I had aimed to do. My ball had struck exactly where I intended, a little above the center of the left shoulder, ranged downward and lodged against the skin of the right shoulder. I stood looking at the big fellow lying there until I had recalled the whole transaction, and then soliloquized thusly: "Well, that's another of those unexpected occurrences that don't repeat themselves."

When I had the buck ready to hang up and was cutting the first fork Hedrick came in sight, and I changed my plan and proceeded to peel bark and cut two small poles to make a litter. At first Hedrick demurred. He said we would never carry that buck to camp whole. "Hain't he a big one!" was his exclamation. The hunter who scared him up and shot at the streak came along, and after looking him over and telling how big he looked as he went out of sight left with the parting remark that we had a job on our hands.

But we got him out to the railroad and were lucky enough while resting to attract the attention of two young woodchoppers who were passing. They wanted to see how heavy he was, and their curiosity, coupled with good nature and willingness to lend a helping hand, made light work for us the remainder of the way. Gable had heard of the kill from the other hunter, who had gone on to camp, and met us near the railroad to carry our guns. Gable, by the way, had rheumatism in his right shoulder to the extent that it was not only very painful, but made the shoulder so lame as to be almost useless. It prevented his shooting, and annoyed him a great deal in fishing and managing a raft that he and Hedrick built on Witch Lake. But, like Barkis, he was willin', and more than once declared this the finest outing in his experience.

When the buck was hung up at camp the word reached the settlement that the big buck had been killed, and Messrs. Gibbon, Spencer and their wives came to see him. Should these lines meet their eyes I trust they will pardon me for the reference. Mr. Gibbon said he had been on the trail of this fellow, but had not got sight of him. Mr. Shellman and wife, and our neighboring camp of hunters also came, and the lowest estimate of the weight of the buck was 250 pounds as he hung. From the complimentaries on the kill, especially by

our lady callers, I was led to infer that there was more honor in capturing one big noble looking buck than a number of ordinary deer. But again I recalled that when last camped on this spot, and I killed seven deer, among them a fine 12-point buck, we had no lady callers. I skinned out the forequarters, recovered the ball, and have further proof of what a .38-40 Winchester can do. The hole in each shoulder blade was almost an inch in diameter, and one blade (I don't remember which) was split over half of its length. I give these incidents for the benefit of such of your readers as they may interest. As for me, when the chase is ended the story is finished. I don't enjoy the butchering part, only so far as it proves the success of an exciting or skillfully consummated bit of sport.

A couple of days later, on my return from a morning hunt, I found the camp shrouded in mystery. I was certain something unusual had happened, but asked no questions. Gable and Hedrick had been fishing and were sitting near the stove. Gable had torn his pantaloons below the knee, and finding nothing better with which to patch them had used a portion of a canvas bag, and to hide the contrast had rubbed the patch with a piece of charcoal. But that wasn't what made him fidget on his camp-stool and look at Hedrick several times before speaking. Finally he blurted out: "Let George see it." Hedrick arose from his stool, and going to the side of the tent brought up from behind his trunk an old game sack, and out of its innermost recess took a fish over 30 inches long, and laid it on the ground. Looking up at me, he asked: "What kind of a fish is that?" Then I laughed, for I saw the point. Seeing that my companions thought it no occasion for levity, I answered "a lawyer." Neither of them had seen a lawyer fish, and were afraid they had taken something the law protected, yet it was such a prize that they were holding it for identification. They said they had baited their hooks, and run their poles in the muck in the lake, and expected to have some more lawyers in the morning. The following morning Hedrick went to Floodwood to get tickets stamped, and order checks for baggage preparatory to leaving for home that evening, and I went out with Gable to get the lawyers. Sure enough, there was something tugging at two of the lines, and we hauled in two more lawyer fish, one over 30 inches, the other about 24 inches.

This brings me to the evening of our outing; but before closing I want to mention seeing a good many fresh scrapes and horning of bushes. I brought home a section of a cedar bush that had been horned only a short time. I don't know at what time the deer up there shed the velvet, but my opinion is that a great deal of the horning and scraping I saw on this trip, which began Nov. 10 and ended Nov. 24, was done long after the velvet had left the bucks' horns.

And now adieu to Witch Lake. The land is finding owners that appreciate its fruitfulness, and the wilderness alone has any claims on the non-resident. Possibly when the autumn of 1900 is a thing of the present, I may be so fortunate as to find an asylum in a wilderness where I can commune with nature and not feel that I am disturbing some land lord's cattle. The friendship of the settlers I have met in the deer woods is so genuine that it should be respected.

G. W. CUNNINGHAM.

Massachusetts Game Interests.

BOSTON, Mass., Dec. 15.—*Editor Forest and Stream:* The convention of sportsmen held here yesterday was representative of the sentiment of the State. The meeting was called at the Copley Square Hotel, under the auspices of the Massachusetts Fish and Game Protective Association, and some thirty delegates were present. Among the speakers were President George W. Wiggin, of the Association, and Mr. A. D. F. Kinney, of Worcester, who said:

"I am here to-day at the head of a delegation from Worcester with a dozen men interested in the matter. Our proposition is a unit. It is this, that something must be done to protect what few birds we have, and that something must be done speedily. What we believe is that the sale of game must be prohibited. [Applause.] We go still further, and believe that the season should be shortened. [Applause.] We believe that the month of December should be included in the close season. It is a fact that the better class of sportsmen of Massachusetts have been making an effort for the last twenty-five years to make this outdoor recreation of hunting a popular one. They have given their money and they have given their time for the accomplishment of this end. It is a common thing for a young man to be seen with a gun, dog and hunting suit, and society does not think it strange. Society recognizes the fact that he is out for a healthy moral recreation. Men of my age have been trying to make that kind of recreation popular. Instead of young men spending their time in billiard halls and similar places, they can go into the woods, which they could not do if the recreation was not popular. We have also made it popular for young men to shoot at the trap. We have improved their arms and their legs and they have taken to this recreation so well that there is nothing more left to attract them into the brush.

"But they are not guilty of the destruction that has been going on for the last few years and depleted the game birds. Another class is responsible. It is the class that is so expert that it can kill more game in two days than a young man of the other class can kill in an entire season. They are induced to do that for the few dollars they can get. It may be said that foxes, skunks and other vermin are responsible for the decrease of game. That is not true. In Worcester county, twenty-five years ago, there were as many skunks and foxes as there are now, and there was more game in the covers twenty-five years ago than there is now or has been since. I have positive knowledge that there is not one bird where there were twenty or twenty-five that number of years ago.

"We have simply accomplished the almost total annihilation of the bird. Now we should begin at the root of the evil instead of lopping off the branches, as we have in the past. Many will say prohibition of the sale of game cannot be accomplished. I have no sympathy with that statement. I know that right with right men behind it will prevail. It is morally right to protect the game and induce young men to get out into the covers and enjoy this moral recreation."

Mr. Kinney's views were seconded by Capt. J. W. Collins, of the State Commission; Mr. L. F. Herrick, of Worcester, and Jno. W. Adams, of Rutland. A committee of five, consisting of Messrs. A. D. F. Kinney, J. R. Read, H. S. Fay, G. H. Palmer and C. C. Munn, prepared a set of resolutions, which ran as follows:

"For the purpose of effecting a general organization of all associations in the commonwealth interested in the protection of fish and game, insectivorous birds and forestry, we recommend the adoption of the following:

"That each association in the commonwealth choose one delegate to represent it, and form a central committee with full power to act in securing legislation and taking such other steps as are necessary, and that H. H. Kimball be asked to act as secretary until said committee is organized.

"We recommend open season on rabbits, squirrel, woodcock, ruffed grouse and quail, to commence Oct. 1 and end Dec. 1, and that close season on Mongolian pheasants be extended five years from Feb. 15, 1900.

"We recommend that the sale of all game birds, excepting water fowl, be prohibited.

"That the laws be amended so as to provide suitable fishways to permit the passage of food fish to their spawning beds.

"That the central association use means to secure all funds to bring these measures before the Legislature and secure their passage."

The Association will continue its effort to enlist the co-operation of individuals and societies throughout the State and the outlook is for a strong movement this winter to secure the amendment demanded in the resolutions.

Quail Shooting in the Blue Ridge.

EVERY year when the air gets clear and fresh and the white frost glistens upon the grass in the early morning, my mind begins to dwell upon the brown fields and sedge grass and cover in which my little friend Bob White hides himself; and as I have not seen the little fellow for many a long month, my heart warms toward him, and I begin to look about for a place in which I may find him most abundant. Well, of course, there is but one thing to do, and that is to consult the columns of FOREST AND STREAM, and tucked away in a little corner thereof I found a few lines telling of the Hotel Wheeler, located at Hendersonville, in western North Carolina.

Now it so happened that I had a lot of business to attend to almost in that very section of the country, business which called me to Asheville, and as I found Hendersonville was only twenty-two miles distant, as soon as I had attended to business I took the train, and on Saturday afternoon, Nov. 25, 1899, I found myself safely delivered at the railway station at the charming little town.

Of course I supposed that the Hotel Wheeler was like almost any hotel in these North Carolina mountain points, and my surprise was great when I found myself in a perfectly new house with every modern convenience. The hotel is a new creation, and commenced business only last summer. It is located on a hilly site on the outskirts of the little town of Hendersonville, and has a most charming view of the distant mountains from its piazzas. Hendersonville is some 2,600 feet above the sea, and is frequented by the aristocracy of Charleston, Louisville and Cincinnati, as is evident by the charming villas and country houses which one finds located in every direction, not only in the village itself, but for miles away in the surrounding country, and indeed no more charming place, no stronger air, nor purer water can be found anywhere than in this beautiful rocky region of western North Carolina.

Well, let us go back to the quail shooting. I found that mine host, Mr. Wheeler, was a first-class shot and a capital sportsman, and as he possessed two fine dogs, Nellie and Flora, it did not take us long to perfect our plans for a daily hunt for quail.

Of course, being a mountainous country, all the farming is done in numerous little valleys, which are visible everywhere, and which are watered by the coolest, clearest of rivulets that I ever saw. The fields have been planted in corn, wheat and rye, affording abundant food for the birds, which are indeed plentiful. So bright and early on Monday morning the team was ready for Mr. Wheeler and myself, and after a delightful ride of some five or six miles we entered the fields and put the dogs to work. As Mr. Wheeler knew where every covey was located, this was a great advantage to us, but somehow or other we thoroughly hunted through several large fields without finding a bird, at which I became greatly discouraged; but we found later on that some boys with rabbit dogs had been ahead of us, which accounted for the absence of the birds. But, by and by, I having gotten tired with tramping so much, Mr. Wheeler announced that he would take the dogs and see what he could find, so away he went, and I seated myself upon a rock by the roadside and lit a cigar and waited for developments. It was not long before I heard from Mr. Wheeler, and there away across the valley I could see the pointer Flora stationed upon the hillside pointing a covey of birds. Of course I didn't lose much time in endeavoring to reach her, but I had gone but a short distance when I found my passage barred by a wide and deep creek, which was bridged by a single log. Now if there is one thing that I never could do in all my life, it is to walk a log across a stream. I never yet failed to fall in, no matter how big the log was, or how small; and as the embankment was fully 10 feet high and the water very deep, I stood aghast, and finally determined to wriggle across. Now, for a man as stout as I am (I weigh 220 pounds) to attempt to wriggle across a log by sitting down upon it and letting one's self up by one's hands a few inches at a time, is by no means an easy task, especially when one is in a mighty big hurry to reach a covey of quail, and although the distance was only about 25 feet, it did seem as if I should never "get there." However, I "got there" at last, and then commenced a galloping over the cornfield. Brother sportsmen, did you ever try to run through a cornfield in which the corn stalks were standing up and lying across your track? If so, you know what that kind of business is. But finally the cornfield was behind me, and I found myself away up against a ditch about 3 feet in width, the other side of which was a very rotten board fence surrounded and protected by barbed wire, and worst of all, this fence, instead of standing up straight, had toppled over toward the ditch, and there I was in plain sight of the dogs and the covey of birds, and my friend urging me to hurry forward. I rushed up and down the fence and the ditch trying to find some available place to get over. At last I discovered a partly detached board on the bottom of the fence, and by wrenching it off and scratching and digging a hole underneath, dog fashion, I managed to get under, much to the amusement of friend Wheeler, who was convulsed with laughter at the way I made the sand fly.

But through all this delay there stood the faithful pointer hard and fast upon that covey, but it didn't take us many minutes to flush it, and as we both made doubles we were well satisfied. The birds flew up the mountain sides, and Wheeler followed them, and as fast as he flushed them they flew back again, and lit along the ditch banks so that we had no little sport then and there.

Well, luck seemed to be coming our way, for it wasn't long before we found another covey, and during the three or four hours' shooting that we had, we found ten coveys of birds and bagged thirty-two quail. We ought to have had fifty birds, but somehow or other both of us seemed to lose our grip and shot very badly. Now why is it that almost all sportsmen will have certain "off days" in which even the best of shots can hardly hit the side of a house? Is it the light, or one's nerves, or what is it? I might go out into the fields to-day and would make the finest kind of a bag and hardly miss a shot, and again to-morrow it would seem as if for hours I could hit nothing.

Well, every day for the next three or four days, the weather was delightful, and Wheeler and I tried the different meadows and valleys with which that country seems to abound, and we found them all full of birds. They certainly are plentiful, and ten to fifteen coveys a day can easily be found with a pair of competent dogs.

If any of my fellow sportsmen, readers of FOREST AND STREAM, want a most delightful spot, both as to an abundance of game, comfortable hotel and charming country, I think that Hendersonville cannot be surpassed, and as I have had some experience with the summer climate of these North Carolina mountains I think it is highly probable that I shall pay them a visit during the hot months. I know that all of my Northern friends seem to think that to go South in summer time is to court a hot climate, but I can assure them that the climate of the mountains of the Blue Ridge of North Carolina at those high elevations cannot be surpassed in summer time, that is, if one wants dry, bracing air, cool nights and no flies or mosquitoes whatever, and fine speckled trout fishing.

ROBERT C. LOWRY.

CHICAGO AND THE WEST.

Shooting with the Saginaw Crowd.

(*Continued from page* 489.)

On the second day at Grassmere the weather proved still cool and cloudy, and not badly adapted to hunting purposes. The party paired off much as before, less Mr. Huumphreys, who was obliged to return to Saginaw on the morning train. Mr. Mershon and I again shot together, but as he also was obliged to go home that evening, his train leaving about 4 o'clock, we arranged for a short day, and visited again the country over which we shot on the day previous. We too had proof enough in our own experience of the fickleness of shooting fortune. As on the previous day we had shot in exceptionally good luck, killing practically every decent shot we had; to-day the reverse was true, and we did some very patchy work indeed. First point was won by the setter Queen, and Mr. Mershon gave me the shot. I missed with the first barrel, and my friend killed the bird an instant later. We went on into a willow thicket, and again saw Queen pointing. This bird rose full in view of both of us, going up very high to clear the thicket. Mr. Mershon nicked it with his first load, and I turned it over with mine an instant later, Mr. Mershon's second barrel again catching the bird. He was sure that it fell stone dead, but from my vantage point I could see that it lugged off and fell more than 100 yards further on. In this case old Bob's invariable success at retrieving received its first setback, for search as we might we never found this bird at all. At about the place where I thought it was, Bob began to road, and supposing that he was about to pick up the bird, I let him get a bit too far ahead, and another grouse went out ahead of him, out of my reach.

This was the beginning of our bad luck, and to make a sad story short, I may say that we lost two other grouse that day which were cut up and fell at no great distance. We had less than a dozen birds in our pockets at night, and our shooting reputation was only saved by a little piece of work which we did on a bevy of quail. These birds were put up in the thicket by the dogs, and alighted at the edge near some grass. They went up rapidly, and out of seven which rose we killed six in very short order. After that Mr. Mershon killed a couple of grouse, long, hard shots in heavy cover. We went home that night rather crestfallen, though we did not find any one of the party with success very much better than our own. Still, by this time every one was bringing in the birds, and the arch over the door of the old car began to have quite a sporting look with the long festoons of grouse and quail which were hung up to cool in the chilly air. Jake and Harry again played their parts nobly, and at night the trials and disappointments of the day were forgotten. The Saginaw Crowd has just as good a time in the round up at night as it does scattered over the country in the day time.

The Third Day.

The shooting not proving so good at Grassmere as was anticipated, the car was dropped down to the south and stopped at Akron early in the morning of the third day. Here a half-hour later we were again met by Mr. Mershon, who came on the up train. On the evening previous we had been joined by Dr. Sumner, of Rochester, N. Y., who was to prove a very desirable companion, and one of the fittest to join this shooting company.

At Akron we were in the hands of our friends. Dr.

Sumner and Jack Morley dropped off and hunted back the track, and Dr. Cross and Mr. Briggs, as usual, made a quiet and modest hunt, but a local merchant by name of Mr. Cook took out the party, excepting Mr. Mershon and myself, who were taken in charge by two young gentlemen of the town and escorted a couple of miles out into the country. These young men had not any dog, and we all four shot together, with what results may be imagined.

This was not what Mr. Mershon or myself would call a red letter day, for bad luck seemed to stay with us. To begin with, old Bob began to crouch and run a trail which we were sure meant partridge, but Queen, in a very unladylike way, ran in ahead of him and put up two birds. A little later she retrieved herself by pointing nicely near a log, and a partridge went out, which I killed. A hundred yards on, she pointed stanchly once more, and one of the young men and myself divided on this bird. We next went after quail and got a bevy scattered on dry leaves, on which we all did very bad work, sometimes all missing the same birds, and sometimes all shooting into it—a very sad state of affairs. We had less than a dozen birds between us when dusk came on, and Mr. Mershon and I started on foot for town, the others going to a farm house nearby for the team. We had walked nearly to town in the dusk, when, looking back down the road for the team, I saw a bunch of birds closely packed fly across the road toward a little stubble field. Against the sky line they seemed as large as prairie chickens, but I knew they must be quail. We hurried across the fence and in a moment were among them. With very good luck, we knocked down five out of six shots, almost in the dark, Mr. Mershon killing two very long shots indeed, but we lost two birds in the hurry, and so we finished our walk and our day of somewhat monotonous ill fortune.

Arrived at the car we found that everybody else had had good luck. Dr. Sumner came in with five partridges in his pockets. He was weary and footsore, having had to walk more than five miles from the point where he had struck the railroad. Jack Morley had, if I remember correctly, three partridges and quite a little string of quail. He complained bitterly of his poor shooting, and said he had seen birds enough to have made a fine bag. The Cook party brought in a lot of quail and reported fine sport, though the birds were mostly marked down in hard swamp country. Mr. Cook said that he had fired thirty-five shots during the day, and all the others reported plenty of excitement. The game piled up in the middle of the floor of the drawing room that evening made a goodly show. And then, I ween, a dark frown sat upon the features of Billy Mershon as he realized that he had not been in it. "We'll move the car to-morrow further down the track," said he. "I'll take you into the country above Guilford, and we'll get plenty of quail, even if we don't seen any partridges." There was some demur to this from those who had had good luck in Akron, but it was finally decided to make the shift the following morning.

The Fourth Day.

The fourth day dawned clear and pleasant, and we set forth to do or die. The plan was to hunt from the little station where the car had stopped in parties much as above indicated, with exception of Jack Morley, Dr. Sumner, Mr. Mershon and myself. Jack Morley went back over his country near Akron, coming down on a later train. Mr. Mershon, Dr. Sumner and myself dropped off the car about four or five miles above Guilford, where the conductor obligingly slowed down for us. Dr. Cross and Mr. Briggs as usual kept close at home, and for them I may say they had better luck than any of us, their bag being eighteen birds, more than any other two guns brought in that day. Mr. Harvey and Mr. Geo. Morley began to pick up in their shooting and added a handsome bunch of birds to the strings. Jack Morley had his pockets bulging when he joined us. Mr. McCarty had been obliged to go home.

The little party of three of which I was a member had a most enjoyable day, and I must say I never was out with two better shooting companions in all my life, my only complaint against them being that they shoot too well to be in my class. We found this country an open farming country, and ideal in its appearance for quail, though we put up only three or four bevies during the day, these, as usual, taking to the thickets after the first rise. Dr. Sumner took his pointer and went around one edge of a bit of wood, while Mr. Mershon and myself followed Bob in the opposite direction, Queen having been left at home on this day. Presently we heard a couple of shots and soon after saw Dr. Sumner motioning us to come up.

"Did you get any?" said Mr. Mershon.

"Only two," said Dr. Sumner, calmly. He was about the coolest, calmest man I ever did see. It was with this same calmness that he explained to us where the birds were marked down. They seemed to have run together at once after lighting, for they went up wild ahead of the dogs, and all in a bunch, Mr. Mershon scoring the only chance, a long shot to the left. We marked them again among some old logs, but the birds flew very wild and were hard to handle. Even Mr. Mershon missed one, but an instant later Dr. Sumner cut down one under what I called the hardest sort of conditions. The bird sprang directly in front of him and crossed back, very high and dropping swiftly. To kill this shot one must hold far below the bird, something which few people have the nerve to do. Dr. Sumner did the trick handsomely and put the bird in his pocket as calmly as if he were used to doing that sort of thing right along. I got one shot here and managed to stop my meat.

After that things became a little confused. The wind was very high, and shooting was difficult, the quail putting up a game that day which was hard for both dogs and men. For my own part, I went entirely out of even my usual bad form, and fain would draw veil over the occurrances that followed. I don't believe I averaged one quail in three shots. The old stagers who were with me were much steadier, and the unruffled Dr. Sumner continued to put bird after bird in his pockets, each time with a deprecatory cough as though he were really apologizing for shooting so well. Indeed, I think he owed me an apology, too. The Doctor and I shot together most of the day, and indeed toward evening were quite separated from Mr. Mershon. All through the day we had more of the hard luck which had followed Mr. Mershon and myself. It seemed as though the quail were phantoms, and when we knocked them down they would disappear even before the noses of two as good field dogs as I ever saw. We lost during the day eight birds which we knocked down and did not find. Once Dr. Sumner's pointer, after trailing the bevy down wind for fully 200 yards, gave us a splendid point, out of which we got a fine bevy rise together. We knocked down four birds, which fell on naked blue grass sod, yet we never picked up but two of them, the others being crippled and escaping. The balance of this bevy we marked in a little clump, and Dr. Sumner going in killed two in the heavy cover. I crippled one and missed one as they came out of the thicket, and Mr. Mershon wiped my eye handsomely on one of these from his station at the fence beyond. He then knocked down a second bird, which fell in plain sight on the blue grass, but this bird too got away, and we began to lose faith in all mundane things, for Bob had never allowed this to happen in all his days before, and Dr. Sumner's pointer is also usually safe to locate what comes down. At this warm corner Dr. Summer proceeded to stop another bird, which had run along the fence, and he and Mr. Mershon divided honors on a 40-yards stop on a bird which made back toward the heavy cover.

We drew a good many blanks after that, until later in the afternoon, when Dr. Sumner found another bevy, which he marked down scattered along the edge of a swamp. Here I fear I spoiled part of his pleasure. His pointer made a beautiful point and the Doctor stepped up to take a picture of him with the kodak which he had brought along for that purpose. Thoughtlessly stepping to one side in order to cover the bird should it go up, my action caused the dog to turn about, and the bird rose from between his feet. As the Doctor had laid down his gun, he could not shoot, and I killed the bird, though I had spoiled the picture. The Doctor took this very calmly, and with equal calmness he wiped my eye four or five times within the next hour on some singles which we got scattered in an open wood. Here we lost Mr. Mershon, and practically wound up our day's shooting. It was dusk when Dr. Sumner and I got back to the car. I think he had just under a dozen birds for his day's work, Mr. Mershon and I being much less fortunate. Others reported that more birds were found right near the car than further out in the country.

This closed the hunt for me, and indeed for most of the party, as the car ran into Saginaw that night. This, however, was chiefly for coal and provisions, for on the following morning some of the gentlemen pulled out north again with the car, bound this time for Omar. I am sorry to say that the latter trip was hardly more successful than those reported above. I never had a more delightful time in my life, and it would be a privilege to shoot with the Saginaw Crowd even if one got nothing at all, but it could hardly be said that we had very heavy shooting on this occasion. We took an inventory on the car before we reached Saginaw, and discovered that the entire party had brought in 154 quail and 30 partridges. This seems like a pretty big pile of game, if you see it all together. Yet it took eight guns the best of four days to make the bag, and during the time I do not think any one man bagged a dozen birds on any one day. As in this party there were some wing shots as good as any in the land, it may be seen that the supply of birds was none too good on this country. The Omar trip was practically a blank. Yet the car was not to cease its wanderings, but was kept in commission for the best of the following week, Mr. George Morley especially being emphatic in his assertion that he was out for a week's quail shooting and he intended to have it. By later letters from Saginaw, I am advised that two or three other points were visited, and that finally they did get some fairly good shooting, though not so good as they might have expected it a couple of years ago. Mr. Mershon, who was making positively his last appearance when I left him at Saginaw, managed to sneak out again, this time for better results. On one day he hunted Queen alone, and she made him nineteen points with only one flush, and he killed eleven partridges and six quail. He got one bunch of four partridges and killed all four. Therefore, I may say that our ill success of the earlier days was fully avenged. Dr. Sumner also had some sport after I left the party, one day four partridge and eight quail, and I am advised that George Morley completed the ruin of the gabardine suit with which he started out, and added many quail to his string before he decided that his hunt was over.

Such are some of the nearby wanderings of the Saginaw Crowd, all of them business men, all of them sportsmen, and I may faithfully add exceedingly hard men to leave behind, whether as shooters or as hosts.

The Founding of St. Louis.

CHICAGO, Ill., Nov. 10.—There is a certain interest, which increases as one gets into the habit, of prowling around in the ancient history of familiar places and things. As I have sometimes mentioned, I have found considerable pleasure in reading about the beginnings of that country which we call the West. When one is forced to study history as a schoolboy, it goes against the grain; but the history habit, once taken up from choice, is quite a different thing.

Perhaps a good many of us are in the habit of dating everything in America from the Fourth of July and the Revolutionary War. It is popularly supposed that the American settlements were then in what we now call the East, and it is getting very fashionable to write novels located in the Revolutionary period and Revolutionary territory. As a matter of fact, however, there was a West even at the time of the Revolutionary War, and a West whose drama was so vivid that no one has yet needed to write fiction about it. The progress of the French settlements westward along the St. Lawrence and the Great Lakes, and thence into the Mississippi Valley, began nearly three hundred years ago. The upper Mississippi Valley was taken by the French, while the mouth of the Mississippi, which would naturally have belonged to the early Spanish explorers, was juggled from hand to hand between the French and Spanish. Meantime, between the French on the north and Spanish on the south, there drove in that wedge of Anglo-Saxon civilization which never retreats from a country it has once occupied. Thus our Boones and Kentons and Wetzels pressed West until they reached the country midway on the Mississippi River and came into ground part French, part English and still faintly Spanish. That is to say, it had had this mixed complexion at a date long before our Revolutionary War. Already there had begun the opening of that great Northwest country later to be known as the Louisiana Purchase. The genesis of the American trapper and fur trader may thus be seen to clearly antedate the Revolutionary era.

If in the popular mind the Mississippi River be indissolubly associated with the idea of a mighty commerce, so is the Missouri River equally suggestive of a land of Homeric adventure. Sometimes I trace out the course of that crooked stream upon the map, figuring in my own mind the different points where I have crossed it, and then thinking what those places must have been a hundred years and more ago. Perhaps not every one may remember at first thought that the city of St. Louis, the gateway of that old Land of Great Adventures, the valley of the Missouri, was founded before the Revolutionary War. It was holding on in the even tenor of its way as a growing trading point in those troublous days after the Revolutionary War when the Americans living west of the Alleghany Mountains were figuring on starting one or two new republics of their own, and when Gen. Wilkinson, once of the American army, was intriguing with the Spanish commandant at New Orleans to hand over the whole Ohio Valley, to be added to the provinces of Spain. Gen. Wilkinson seems not to have been a gentleman, but a gent. He did not arrive.

Now, as to the founding of St. Louis, supposing that this beginning of the Northwest seems as interesting to everybody else as it does to me, we are to imagine the French up the Mississippi River, the Spanish down the river, and the English claiming the east bank of the river. The French were in temporary control in Louisiana, and in 1762 a gentleman by the name of D'Abadie was Director-General. They had a great way in those days of giving exclusive rights to some fellow to trade or hold lands exclusively, over a territory bigger than all outdoors. M. D'Abadie farmed out the exclusive trading right with the savages of the Missouri and "all nations residing west of the Mississippi River" to a company formed under the name of M. Laclede Ligueste, Antoine Moxan and Company. If these gentlemen had had a notion of what this Western country was going to be, they would probably have felt sorry that they could not hold it all down. As it was, they were satisfied to begin with the building of one modest little settlement.

M. Laclede Ligueste was advance agent of the company, and he went up the river on Aug. 3, 1763. He arrived in Illinois, Nov. 3, 1763. Meantime, by one of the pleasant little changes of the time, France had ceded to England all the settlement on the Illinois side of the Mississippi River. On the Missouri side of the river there was only the settlement of St. Genevieve, and here Laclede could not get a house big enough to store his trading goods. Making temporary arrangements at Fort Chartres, on the Illinois side, Laclede set out to look for a town site of his own, and after canvassing all of that country he settled upon the site where the city of St. Louis now stands.

This was in the month of December, 1763. Laclede's companion in this search for a townsite was a young man named Auguste Chouteau, ancestor of the prominent Chouteau family who are still citizens of St. Louis. My friend Mr. Horace Kephart has sent me a little pamphlet showing a part of the ancient "Chouteau Narrative," describing how the settlement of St. Louis was made. Laclede blazed some trees with his own hand and laid out the lines of the town. He and Chouteau then returned to Fort Chartres to look after their goods. In February, 1764, they went back with boats and men to the townsite. On March 14, 1764, the men actually went to work, first building the shed for a store room, and then going on with their cabins.

These first builders were much bothered by Indians, of whom numbers came and camped around the growing settlement, but the latter were finally induced to go away, and after they had left, a few families, with women and children, came from the other French settlements on both sides of the river and settled at "St. Louis," as this settlement was now named in honor of Louis XV.

Meantime, other matters were shaping themselves to the gain of the embryo city. The treaty of 1762 had given the Illinois country to England, and orders went out from the Governor-General of Louisiana to M. de Neyon de Villiers, who was then Governor of upper Louisiana, or Illinois, to evacuate all that country. Neyon was an odd genius, and he thought he would cut something of a swath if he went down the Mississippi with a big retinue. So he told pretty much all the French folk around these upper settlements that they would better move out and go down the river into French territory, where they would be free from the English and could live as they liked. A great many people left the old Illinois French settlements and went down the river with him, in spite of the advice of Laclede, who understood what the little game of Neyon was. By this time there had been another change of affairs at New Orleans, and that country was now in the hands of Spain, so the unfortunate families who had followed Neyon down the river were much worse off than if they had stayed where they were. Nearly all who were left up the river listened to Laclede, and Fort Chartres and the other little setlements thereabouts were practically abandoned by the French, who all moved over to the new town of St. Louis. And there you are.

Ten years before the War of the Revolution we were doing business out here in the West, and we have never stopped from that time to this. This was the beginning of that epoch of our Western life when the trapper and the hunter were typical figures of the poplation. From that time to this the glory and the charm of those wild, free days have never faded.

An Early Game Dinner.

Mr. Charles Hallock, writing from Washington, D. C., incloses to me a newspaper clipping bearing date of Dec. 2, 1886, and describing the menu of one of the erstwhile famous game dinners given by John B. Drake, of the Grand Pacific Hotel, Chicago. Although this was thirteen years ago, it was the twenty-first annual game dinner given by Mr. Drake. The menu certainly ran the gamut of our Western game, and was as follows:

Blue Points. Soup—Venison, hunter style; game broth. Fish—Trout, black bass. Boiled—Leg of mountain sheep,

ham of bear, venison tongue, buffalo tongue. Roast—Loin of buffalo, mountain sheep, wild goose, quail, redhead duck, jack rabbit, blacktail deer, coon, canvasback duck, English hare, bluewing teal, partridge, widgeon, brant, saddle of venison, pheasants, mallard duck, prairie chicken, wild turkey, spotted grouse, black bear, opossum, leg of elk, woodduck, sandhill crane, ruffed grouse, cinnamon bear. Broiled—Bluewing teal, jacksnipe, blackbirds, reed birds, partridge, pheasants, quail, butterball duck, English snipe, rice birds, redwing starling, marsh birds, plover, gray squirrel, buffalo steak, rabbits, venison steak. Entrees—Antelope steak, rabbit braisé, fillet of grouse, venison cutlet, ragout of bear, hunter style; oyster pie. Salads—Shrimp, prairie chicken, celery. Ornamental dishes—Pyramid of game, en Bellevue. Boned duck, au naturel. Pyramid of wild goose liver in jelly. The coon out at night. Boned quail, in plumage. Redwing starling on tree. Partridge in nest. Prairie chicken en socle. Among the guests was Long John Wentworth, who had been present at the first dinner, thirty-one years ago.

At the above dinner Mr. Hallock was the guest of honor, and he makes the following comment, with some description of his earlier wanderings, which show him to have been something of an old-timer himself:

"This is interesting especially to me, as I was a guest at the third of these game dinners, which was given at the old Briggs House in Chicago in the early fall of 1858. I think it was about Oct. 1. Don't remember the exact date. I had just returned from northern Minnesota, having footed it all the way from St. Paul to the Red River of the North. Buffalo meat was still possible at the date of the twenty-first annual dinner in 1886, though becoming quite scarce. I was Mr. Drake's guest of honor, as my trip was considered quite an adventure. I wrote it up for Harper's Magazine same year. There were no settlement north of St. Joseph, except a Catholic Indian mission, then located twenty miles from St. Cloud, and ninety-five miles north of St. Paul. Indians were somewhat troublesome even then, but did not break out until the massacre of 1862. After the insurrection was suppressed thirty-six of the red ringleaders were hung at Shakopee at one time. A friend of mine on the frontier lost his wife and family during his absence from home—all tomahawked. He afterward evened up with the Indian by bayoneting him and taking his entire scalp, ears and all. This specimen came into my hands later on, and after some years I donated it to the Long Island Historical Society of Brooklyn, where it is now. Quite a curiosity."

An Operatic Singing Mouse.

Mr. Earnest Seton Thompson, the well-known naturalist and artist, writes me regarding an operatic singing mouse, which seems to have annexed itself to his menage: "Since last I wrote you, an operatic singing school has moved into our rookery. To-day our Erse domestic remarked: 'It's just wonderful how that there singing mouse has improved since the operatic school tuk the lower flat.'"

Dog in a Bag.

You see all sorts of funny things in a city. This morning as I was going down to my office I saw a woman carrying a rat terrier. The air was sharp with the first cold wave we have had, and the woman had inserted the dog carefully into a paper bag, out of which its head protruded very comfortably. This was really not at all a bad idea, as any one can testify who ever wore a paper vest.

E. HOUGH.

480 CAXTON BUILDING, Chicago, Ill.

New England.

BOSTON, Dec. 23.—The big-game season on the Megantic preserve was a good one. Mr. L. Dana Chapman, secretary and treasurer, finds that fully 100 deer were taken on the lands of the preserve during the open season by members and invited guests. Partridge shooting was the best for years, with duck shooting good. It will be remembered that the fishing season was a particularly satisfactory one, and the club management is doing everything possible to keep the fishing up, and even to greatly improve it. Mr. Chapman himself has made a late trip to the preserve, and has landed more salmon there than any other member, or anybody else in fact. He landed 5,000 there on his last trip, though it was in the midst of the close season. They were little fellows, however, and landed into the waters for restocking. Mr. Chapman then went over to Jo Merry Lake, and was fortunate enough to have just the right fall of snow the night he arrived. But the next morning was Sunday, and legal close time. In the afternoon he was out with his guide. Soon they saw what the guide at first pronounced to be a cow moose in the thicket, but turning about it proved to be a big buck deer. This one was located, and early Monday morning Mr. Chapman had him. The next day he shot another, and was much pleased with his trip. Good tracking snow did the business.

The weather is against the pickerel fishermen in this State. Not a particle of ice, and little signs of any. The water is also very low in the pickerel ponds. Christmas day the fishermen cannot have their usual sport fishing through the ice. But some of them are bound to try. They have provided themselves with "bobs," and will set their lines from boats. The line is attached to the float or bob by means of a little lever that projects from one side. Nearly opposite this lever is attached a little flag. When the fish is on and pulls the lever down the flag is up. Indeed, all the jerky motions of biting and swallowing the bait are communicated to the flag, and those who follow the flags with a boat say that the sport is really more exciting than ice fishing. A big pickerel will run with bob and all, and often the pursuit with the boat is very exciting.

The ponds in Maine are generally frozen over, though the larger lakes are not, and although the water is very low, some good catches of pickerel are being made A couple of fishermen went from Lewiston to a pond in Turner the other day and returned with forty-one pickerel. They claim that the very low water makes the pickerel more hungry. The Winthrop and Monmouth ponds have scarcely been frozen over sufficiently strong for pickerel fishing, though some ice fishing has been done, with good results.

SPECIAL.

The Minnesota Indian Case.

ST. PAUL, Minn., Dec. 22.—*Editor Forest and Stream:* I send you the text of the decision of our Supreme Court in the Indian hunting case. It is almost a reversal of the former decision in the Selkirk case. Our able Attorney-General, W. B. Douglass, fully believes with Justices Mitchell and Start, and says the decision will not stand. Of course, the Attorney-General had nothing to do with prosecuting the case; that was done by Mr. Donley, the attorney of the Game and Fish Commission, who, when the verdict was against him, ought to have moved for a rehearing, but instead let the matter drop. I believe with the Attorney-General that when a chance is presented to again try a similar case the verdict will be as Messrs. Mitchell and Start have written it. F.

STATE OF MINNESOTA, SUPREME COURT, OCTOBER TERM, A. D. 1899. No. 18.

State of Minnesota, Appellant, vs. Al Cooney, Defendant; Julia Selkirk, Intervenor-Respondent.

Syllabus.

While the State authorities have a very extensive jurisdiction over the territory included in the White Earth Indian reservation in this State, held, the tribal Indians on the reservation have under their treaties with the United States, and the acquiescence of the State for over thirty years, a license to hunt and fish on the reservation in their usual and traditional manner in order to procure food for themselves, notwithstanding that the State laws prohibit such fishing and hunting.

Order affirmed.

Opinion.

This is an action of replevin for the meat of fourteen deer. The action is brought in the name of the State by authority of the Board of Game and Fish Commissioners, under the claim that such meat was in the possession of the defendant after five days after the close of the open season, contrary to Sec. 14, Chap. 221, L. 1897. Julia Selkirk intervened, and in her complaint of intervention alleges that at the time of the seizure of the game under the writ of replevin herein, such game was on the White Earth Indian reservation in this State, and she was in the possession of the same and the owner thereof; that she is an Indian by birth and a member of one of the tribes of Chippewa Indians dwelling on said reservation, and was both at the time of the seizure of said game under the writ and at the time she acquired the same, authorized by the United States to trade and barter with the Indians on the reservation. That during the time when the killing and possession of deer is authorized by the laws of this State, certain tribal Indians lawfully belonging upon the reservation killed the deer thereon and during such open season, bartered the same to her, and that she held the same for the purpose of bartering the same to the Indians on the reservation and of supplying the children attending the Indian school thereon with meat, and that no part of the meat was ever removed or intended to be removed from the reservation except by plaintiff under said writ.

Plaintiff demurred to this complaint on the ground that it does not state either a cause of action or a defense, and appealed from an order overruling the demurrer. In our opinion, the order appealed from should be affirmed. In Selkirk vs. Stephens, 72 Minn., 335, we had occasion to go into the history of the White Earth reservation. The territory covered by the reservation ceased to be Indian country in 1855, as it was in that year ceded by the Indians to the United States, and the laws of the United States and of the Territory of Minnesota were then extended over the ceded lands, which remained in that condition until after Minnesota was admitted as a State in 1858, and until 1864, when a new treaty was made with the Indians, and 1867, when another treaty was made, whereby these ceded lands were set apart as a reservation, and the Indians have since resided and maintained their tribal relations upon the same.

We are of the opinion that while under those circumstances the jurisdiction of the State authorities over the territory covered by this reservation is very extensive, it is not so extensive as to enable the State authorities to destroy or impair the efficacy of the guardianship of the United States Government over the Indians, or destroy the effect of the treaties of the United States Government with the Indians. To prohibit the Indian from fishing and hunting in order to procure food for his own consumption, would undoubtedly impair or destroy such efficacy. He is less vicious, more contented and more easily controlled when he is allowed to follow his traditional habits.

He acquires the habits and learns to follow the pursuits of civilized man but slowly. By compelling him suddenly to break off his old habits and attempting to compel him to form new ones, he becomes a loafer and a vagabond, both dangerous and criminal, who is a menace to the safety and well-being of all the civilized communities in the vicinity of his reservation. The State has without objection for more than thirty years permtted the tribal government to exist within its borders on this reservation, and we are of the opinion that the State cannot at this late day do any act which will practically destroy that government. Though they are both connected with the Federal Government, the tribal government and the State Government are rather foreign to each other, and the rights as against each other, of governments foreign to each other, usually grow up out of acquiescence and traditions. We do not wish to be understood as holding that as between the State Government and the tribal government, tradition and acquiescence will have any such an extensive effect as it will between governments wholly foreign to each other; but still, we think such tradition and acquiescence as between the State Government and the tribal government may have sufficient effect to give the tribe a license to hunt and fish within the boundaries of the reservation, as this peculiar right is practically indispensable to the maintaining of the tribal relation.

By the course of things for more than thirty years, it must be inferred that the United States Government assumed that the Indians had a right to hunt and fish on the reservation, and the State Government has acquiesced in that assumption. It is said in U. S. vs. Halliday, 3 Wall, 407 (419): "In reference to matters of this kind, it is the rule of this court to follow the action of the executive and other political departments of the Government, whose more special duty it is to determine such affairs. If by them the Indians are recognized as a tribe, this court must do the same." After thirty years of the mutual recognition by both the Federal and State governments of the right of these Indians to do something so essential to their tribal relations, we are of the opinion that the courts should follow this mutual recognition and hold that while the title to all the wild game is in the State, the Indians have a license to hunt on the reservation in their usual and traditional manner in order to procure food for themselves. In Selkirk vs. Stephens, supra, we held: "This limitation of the power of the State does not arise from the fact that the laws of the State are not operative upon this reservation, but it grows out of the personal relations of such Indians to the general Government. They are its wards, and under its guardianship and control, and the State may not interfere with or impair the efficacy of such guardianship."

The Federal courts have strongly maintained the right of the Federal Government to prevent any action by either the State or the private citizen which will impair the efficacy of the guardianship of the Federal Government over its Indian wards. See U. S. vs. Halliday, supra; U. S. vs. Boyd, 42 U. S. App., 637; the Cherokee Nation vs. Georgia, 5 Pet., 1; Worcester vs. Georgia, 6 Pet., 515.

The two latter cases are instructive and much in point here. Georgia was one of the thirteen original colonies, and clearly from the time of the treaty of peace with England (if not from the time of the declaration of independence) to the time the United States Constitution took effect, Georgia had jurisdiction over the Indians within her borders if any white man's government had such jurisdiction. But notwithstanding that, it was held in these two cases that such jurisdiction devolved on the United States Government.

But if this game was killed or was being held, not for personal consumption by the Indians on the reservation, but for sale or disposal to persons other than the tribal Indians or for shipment off the reservation, then such game is not protected by the license of the Indians to hunt in their traditional manner, and may be seized by the State authorities whenever this can be done without interfering with the person of the Indian in whose custody or possession the game may be, even though it is so seized on the reservation. Whether the game here in question is protected by such license would ordinarily be a question for the jury, and cannot be determined on this demurrer.

CANTY, J.

Order affirmed.

Mr. Justice Collein and Mr. Justice Buck concur.

Dissenting Opinion.

I am unable to approve this opinion.

It seems to me that in view of the history of this so-called reservation given in Selkirk vs. Stephens, 72 Minn., 335, the only logical conclusion is that the State has full and complete jurisdiction of the territory, and that the right of the Indians to kill game upon it is subject to all the game laws of the State. It may be that the remedies of the State for the enforcement of these laws are incomplete so far as the persons of the Indians are concerned; but, if so, it is not because the laws do not apply to Indians, but because of the exclusive guardianship of the Federal Government over tribal Indians on a reservation.

This, however, would not stand in the way of the State reclaiming its own property.

I do not see any sufficient basis for the position that by tradition and acquiescence the State has given the Indians a right to hunt and fish unrestricted by its game laws. Game laws were in force when the Government placed the Indians on these lands. If the State has in years past failed to enforce these laws as to Indians, the same is true as to white men. But if there is any such traditional license it does not extend beyond the right of an Indian to kill game on reservations, irrespective of State game laws, for his own personal consumption as food. It certainly cannot extend to the right to kill or keep game in violation of the law for the purpose of making it an article of commerce and sale. It is not the policy of the United States to perpetuate the tribal relation among Indians. On the contrary, its object is to induce the Indians to abandon their tribal relation and adopt the habits of civilized life as soon as possble. The only interest the Government can have is to preserve for their Indian wards such rights as are essential to their existence while they do maintain the tribal relation. In view of the fact that tribal Indians who have not adopted the habits of civilized life are accustomed to depend largely on the fruits of the chase for their food, it may be necessary that they should be allowed to kill game for that purpose on their reservations all the year irrespective of the closed season under State laws. But there is no necessity that they should be allowed to kill it for the purpose of sale to others. It is a matter of common knowledge that these Indians realize very little from the game which they sell, and what little they do realize is quickly squandered. The idea of these Indians buying game from those who keep it for sale will cause a smile of incredulity on the part of those who know them best; but even if they do sometimes buy it, it is the Indian who kills and sells the game, or the trader who keeps it for sale, and not the Indian who buys it for food, who is benefited. If an Indian has the money with which to buy venison he is able to buy beef or some other article of food with his money. I know of no more effectual method of depleting game in both Indian reservations and the adjacent country than to hold that they may kill it for purposes of barter and sale, or that traders may buy and keep it for sale during the closed season.

As far as I would be willing to go is that conceding, without deciding, that a tribal Indian has the right to kill game on this so-called reservation during the closed season for consumption as food by himself and family, this is the limit of his right; that the right does not extend to killing or keeping it for sale, even to other Indians.

MITCHELL, J.

I concur in the views of Mr. Justice Mitchell.

START, C. J.

A California View.

From the San Francisco Chronicle.

A SYSTEM of game laws has been gradually developed in this State which might be correctly designated "A Code for the Encouragement of Poaching." Every step in its development has been taken under cover of the pretense that it was necessary to save game from extermination.

The American theory regarding wild animals at large—whether birds of the air, beasts of the field or fishes in the waters of the earth—is that the ownership is invested in the public, and as common property may be captured or killed at will. It also presumes that game is a source of subsistance upon which all classes can draw without favor. To prevent the wanton destruction and extermination of game closed seasons have been established when its capture is prohibited. To that extent game laws are beneficent and necessary.

But under the pretext of protecting game from annihilation legislation has overreached itself and laws have been enacted which operate strictly in the interest of the wealthier classes in the community and solely for their pleasure. Through the agency of these laws clubs have been organized for sporting purposes only, and the game of the State is fast being reserved for them. Their preserves extend over wild and uncultivable land formerly accessible to everybody, gamekeepers have been installed to exclude every one except club members, and poaching has, as a natural consequence, followed and been stamped by the courts as a crime.

The latest legal device for the encouragement of poaching has been introduced under the plea that it is a necessary police regulation for the common good. Never was a greater fiction grafted upon any code of laws. The ordinance which has been adopted by a great many counties in the State, Santa Cruz joining the list last Saturday, prohibiting the shipment of game elsewhere for sale, presumes that the killing of game as a pastime and a luxury for a class is no offense, while its slaughter for food for the common people is a crime. Another incentive to poaching has thus been introduced into our game laws.

We are now drawing the lines between the rich and the poor in our game laws, nearly if not quite as sharply as they are defined in the Old World, where the former have a monopoly of nearly everything that runs or flies or swims, while the latter, to gratify the appetite, must resort to stealth and poaching, which was once a capital offense. Only one step more needs to be taken to put our game laws on the same plane as those of Europe, namely, making it unlawful for any one to carry a shotgun without payment of a license.

Nothing can be more obnoxious to the American mind than class legislation. The State Constitution directly forbids it. Yet the sportsmen's clubs seem to have invented a police regulation which overrides the Constitution and gives privileges to one class of citizens denied to all others.

Assuming that the public interests require the preservation of game the State and national reservations and the public lands will always serve as preserves. Laws prohibiting the killing of game on the reservations and during the seasons of propagation would clearly meet all requirements for saving wild animals and set up no class distinction. Beyond that it does not seem possible for the State to go without drawing class lines and encroaching upon individual rights, unless the law of trespass can be so amended as not to include wild land in private ownership incapable of cultivation, entered upon for the shooting of the game temporarily occupying it. With such a system of game laws the encouragement of poaching would be reduced to a minimum.

Consul-General Turner's Moose.

OTTAWA, Dec. 13.—*Editor Forest and Stream:* I have noticed in your issue of Dec. 9 an effusion from Mr. W. W. Hastings, of Jersey City, in which he refers facetiously to my big moose.

Now, my good friends Hastings starts off by saying: "I know Consul-General Turner. I stopped for three years in Waterbury on my way south to New York." It took my friend Hastings a long time to get from Waterbury to New York, as he stayed "three years in Waterbury," and the distance is only eighty-eight miles. For heaven's sake what was he doing, if he was on his way to New York, to stay three years in Waterbury? I don't blame him for staying there if his objective point was Jersey City; and the only fault I have to find is that he did not stay there for good instead of finally landing in the home of the mosquito.

I presume friend Hastings has been shooting mosquitoes in Jersey (not to mention craps), and has come to the conclusion that that is the largest game there is. I don't blame him for thinking so, for I have not heard that he has been out of New Jersey for some time.

He refers to the fact, or rather implies, that "Lo the poor Indian" was "under the influence" when he estimated the weight of my moose as 1,800 pounds. I am very sorry to say I did not have any of Hastings' "Jersey lightning" with me; if I had any of it I presume I could have got the Indian to say that it weighed 2,800 instead of 1 800 pounds. I cannot take very long paces myself, consequently I got the Indian to pace it for me, and as he said 420 yards, I took his word for it as to the distance at which the moose was killed.

This moose, as Mr. Hastings would like to imply, was not a contorionist. He was not standing on his head at the time he was shot, but he stood on his head immediately after. The heart was not in the moose's mouth, for no doubt the moose had enough presence of mind to swallow it; neither were his shoulders up near his mouth, as Mr. Hastings would imply. Our friend, the moose, had his heart in the normal place, and it only goes to show that Mr. Hastings is entirely ignorant of the anatomy of the moose when he asks how it went through his shoulders and heart at the same time. I can only say to friend Hastings that the proof of the pudding is in the eating, and if he will only come to Ottawa and be my guest while he is here, I will show him the head and antlers of the "1,800-pound moose," and if he does not say it is the biggest moose head that he ever saw, I will make him a present of the cheapest Waterbury watch I can buy.

Come up, Hastings, and I will show you some hunting, or rather tell you the locality to go where you can kill something larger than the Jersey mosquito, and give you the best time that you ever had in your life while you stay in the Ottawa district.

I will say to the editor of FOREST AND STREAM that it will give me much pleasure to send as soon as it is mounted a photograph of the head of the "1,800-pound moose" with the full measurements of it.

In conclusion to Mr. Hastings, I am sorry to say that the Government does not supply me with a range finder. I presume that Mr. Hastings would need no range finder at forty rods. They don't keep any "Jersey forty-rod" up here, but if he would send up a little of the kind he can recommend I should try it on the Indian if it wasn't against the law.

Doesn't it seem like another case of the pot calling the kettle black for a life insurance man to question the veracity of even an Indian? C. E. TURNER.

Two Men of the Early West.

Ruxton and Williams.

DENVER, Colo., Dec. 20.—*Editor Forest and Stream:* In your issue of Dec. 9 Brother Hough, in his article entitled "Chicago and the West," gives considerable information about two quite celebrated characters in this Western country in the early part of its history; namely, George Frederick Ruxton and Bill Williams. I judge by Mr. Hough's review of Ruxton that he had read only one of the latter's books, namely, "Life in the Far West." Ruxton published two books. His first was an account of his earlier experiences in this region of country, and the one above mentioned was largely written by some one after his death. The reference to Ruxton's early life is correct. He had been educated for the English army; came to America at the beginning of our war with Mexico, and landed, probably, at Vera Cruz, Mexico. He went up into the interior of Mexico, and apparently was engaged in observations upon the campaign then going forward. He entertained at that time an exceeding contempt for the United States, in the belief that it was oppressing and unjustly making war upon Mexico, a weaker power. Of course, he was not conversant with the provocation or the circumstances which brought about the war. His comments upon the course of the United States were very partial, and unfavorable to this country. He did not remain very long in the neighborhood of where the fighting was going on, but headed northward, passing through Chihuahua, at about the time General Price, with his command of the American army, was moving southward in and through that State, and he seemed to apprehend unpleasant experiences if he should happen to fall into the hands of General Price's forces. However, he made the journy safely and worked his way up as far north as where the city of Pueblo is now, in this State. After some delay at that point, which was a frontier trading post of very little importance, he traveled up the Fountaine-qui-bouille, to the foot of Pike's Peak, where the city of Manitou now stands. He tarried there for quite a time in the winter season, and very narrowly escaped capture by the Indians, who were searching for him, but he managed to keep out of their sight. Soon afterward he made his way eastward across the plains to St. Louis, Missouri, and from there went home. His sentiments toward the people of the United States had greatly changed in the meantime, and apparently he left the country with only the best of feeling for Americans. He was not satisfied with this one visit, but planned to return to the United States for a more thorough exploration of the country, and began making his preparations accordingly. A year or two later he came back, and made his way through the Northern States from New York to St. Louis, where he set about gathering material for his book, quoted by Mr. Hough, entitled "Life in the Far West." While engaged in this work, and after making very satisfactory progress for a time, he was taken ill with typhoid fever, and eventually died in St. Louis, leaving his enterprise unfinished. Some one came into possession of his notes, and carried out his undertaking, in, perhaps, what might be considered a very successful manner. Mr. Hough has probably used the sentiments and labor of this last author, and credited them to Ruxton. If he will read Ruxton's first book, he will find that the early part of it, at least, differs very greatly from the latter part, and from the second book.

This brings us down to old Bill Williams, the second character who appears in Mr. Hough's article. Ruxton's second book gives a good review of Williams' personal history, the major portion of which was probably gathered by Ruxton himself. He gives a report of Bill Williams' death, stating that he was killed, according to his information, in the northern part of what is now called North Park, which he also refers to as called by some of the mountain men, "New Park," and I presume the story is faithfully told by Ruxton. North Park, or "New Park," or, as it was also called, the "Bull Pen," is in the extreme northern edge of Colorado, its northern boundary just touching the State of Wyoming. It is drained by the North Platte, or the North Fork of the Platte River, which heads in North Park, flows northward into Wyoming, to nearly the heart of that State, then turns eastward, uniting with the South Platte in western Nebraska, thence flowing almost due eastward to its junction with the Missouri River. Williams was one of the earliest mountain men in this region of country of whom any definite history remains. He seems to have been a very active energetic, venturesome man. This is proven by the fact that more streams, mountain passes and other localities were named for him than for any other of the early mountain men. In the early modern settlement of this region, including the whole mountain frontier from Yellowstone Park south to Mexico, the name "Williams," or "Bill Williams," was found in all sections of the country, generally applied to some stream, mountain, pass or trail. These names are now being lost, succeeded by other names, but quite a number of them are still remembered and used. But Williams was not killed in North Park, as stated by Ruxton. When Fremont made his last expedition across the mountains in the late forties, he organized his party at St. Louis, afterward adding to it as he traveled westward through the country. At St. Louis he applied to Philander Simmons, an account of whose death was published in the FOREST AND STREAM only a few weeks ago, to accompany him as a guide through the mountains. Simmons declined, telling Fremont that it would be very hazardous to travel through the mountains during the winter, which was Fremont's intention. After failing to secure Simmons, he next went to Williams, and secured him as his guide. Williams led the party along the old Santa Fé trail and up the Arkansas River to the edge of the mountains. Williams advised Fremont to remain at the foot of the mountains until the snow melted; but Fremont was determined to push forward. With great labor, they crossed to the Sangre de Cristo Range, to the San Luis Park, traversed that through deep snow to where the Rio Grande emerges from the main range, and thence followed up that stream to the mouth of Embargo Creek, which enters the Rio Del Norte from the north. They turned up the creek and traveled as far as they could go for snow. There they remained, until all of the animals either died from hunger and neglect, or were killed and eaten by the men of the command. When conditions became almost hopeless, Fremont sent Breckenridge, one of his most trusted men, and three or four other men of the command, to make their way to the Mexican settlement in Taos Valley, to secure assistance, if possible, to succor the expedition. Breckenridge and his men suffered great hardships, but finally reached the Mexican settlement, losing one man, and immediately following them came the remainder of the command who were still alive, with Fremont at the head. The following spring, as soon as they could well make the journey, Bill Williams and several men were sent back to recover whatever they could of the personal effects which had been left when the camp was abandoned. Williams made the journey, and had begun his task at the "Starvation Camp" when the little party was attacked from ambush by Indians, and all were either killed or wounded except Williams, who escaped with a pony, and after traveling some miles, and up to the edge of the forest near the line of timber growth, encamped. After dark, while sitting by his camp-fire, he also was fired upon by the Indians, and was killed. Later in the season, when the Fremont party returned to their abandoned camp, they found the remains of Williams seated against a tree near his camp-fire, where they had been placed by the Indians. They also found, leaning against the tree, beside the body, a rifle, which was recognized as having been given by Williams some years before to a chief of the Southern Ute Indians. The theory of the Fremont party was that the Indians had killed Wiliams without knowing who he was, and that when they came to examine the body they discovered his identity, and left this rifle, which had been given by him some years before to one of the party of warriors, by his remains as an evidence of their respect for him. This is the account of Bill Williams' death, given by Breckenridge and also by Simmons.

Two years ago last fall Breckenridge was invited to attend the "Festival of Mountain and Plain" in this city, and came as the guest of the Festival management. Arrangements were made for a party, including the Governor of the State, to go, later in the season, to the head of Embargo Creek, to examine the condition of the "Starvation Camp" of Fremont fifty years before. Breckenridge was to meet the party at Del Norte, and accompany it as a guide, the party to include photographers and newspaper men to the number of six or eight, in addition to the Governor. It was expected that a good deal in the way of history of the Fremont expedition could be gathered, and it was the hope of the party to find the grave of Bill Williams, under the guidance of Breckenridge. Before the time arrived for setting out on this expedition, however, the great miners' strike at Leadville compelled the attention of the Governor at that point, and others of the proposed party were also engaged in duties pertaining to the strike, so that the expedition was necessarily postponed. Before there could be another opportunity for making it, Breckenridge returned to northeastern Missouri to visit the friends of his early years, and was there taken sick and died. Simmons died recently, and I do not know that there is any one now living who is familiar with the ground, or knows anything about the scene of Fremont's great defeat, or the death of Bill Williams. There is a son of Breckenridge yet living in this State, but he probably knows nothing about the Fremont expedition. A son of the Southern Ute Indian, to whom Bill Williams gave the rifle which was found beside his body, is yet living, and is prominent in that tribe of Indians. It is not likely that he knows anything about the circumstances pertaining to the subject of this sketch.

As an indication of the popularity of Bill Williams among his old mountain associates, I will mention a circumstance that occurred in 1859, soon after the settlement of what is now Colorado by the white people. A convention was called in the summer of '59 to take preliminary steps toward the organization of a State. It was made up of delegates from all of the settlements of this region, and among them were some of the old-time mountaineers. When it came to a discussion of names to be suggested for the State, there were proposed among them Montana, Idaho and others, and the name "Bill Williams" was strongly advocated by a delegate from the Arkansas Valley, near Bent's old fort. Of course no such idea could be adopted by the convention (the name Jefferson was afterward adopted by the convention because of President Jefferson's identity with the acquisition of this Western part of the United States—the Louisiana Purchase), and I speak of it now simply because it illustrates the admiration for Bill Williams among the early traders and trappers of this mountain region.

WM. N. BYERS.

DON'T SHOOT
until you SEE your deer—and see that a deer and not a man.

Sea and River Fishing.

Tenting at Ragged Rapids.

IN the vicinity of Pittsburg there is a happy trio who, with wives and families, have spent many sacred days in the Muskoka and Severn River regions. The other day the leader in all our wildest adventures, when he heard we were wasting time playing billiards, swimming in the natatorium and doing other silly and trivial things, as he thought, expresed his disapproval. "Why will you waste time on imitations when the real sport may be had afield? Don't you know gray squirrels are frisking among autumn leaves? Don't you know rabbits, quail and pheasants are ripe for the harvest? Come with me and Doc Walker. Follow our good dog Don, and find out for the first time what real sport is. If there is one drop of the real thing in your sluggish veins it will be set tingling as a princely grouse goes out with a rush and a roar that would scare a Boer. Don't you know, Jim, I'd rather fire at and miss one of those noble birds than haul in the gamiest 25-pound muscallonge that ever fought to a finish his last battle in those chilly North Country waters?"

Ah, George, I am afraid you are very like the Dutchman who, when called upon to decide which is better, beer or wine, said, "Vich you got most of." I remember your supreme delight when camped on the tranquil Severn River. Don't you remember the thrill that came when you hooked that 15-pounder at the foot of the roaring Ragged Rapids, and you and I as well saw the princely fish swing himself fully 5 feet out of the water; and the iridescent sheen of silver and gold flashed and scintillated in the August sunlight, and when he came down with a resounding crash your smoking reel screamed as exultingly as the eagle that carries to the beetling crags choice morsels for the waiting eaglets? Don't tell me that you would have dropped that rod and fish to have gone 25 feet back in the woods to shoot a barnful of pheasants, each one of the size of an albatross. That lusty 'lunge still carries his coat of mail through the foaming waters of the Ragged Rapids; but the look that came to your face when a straightening bamboo announced a lost cause was one born in the very triumph of defeat. I think that you would still turn your footsteps aside from a cover wherein grouse and quail frequent to do battle with this Goliath of the Ragged Rapids.

Has George forgotten the day when half-way between Rat Island and the East Shore he ran on a snag in the way of a 15-pound muscallonge, that dashed in and out and up and down and came into the boat vanquished but fighting still? and the triumphant yell that came from the fisherman's throat may find its echo running around those encircling bays yet, if it has not since died away in silence. To emphasize the bigness of the fish he gave it to his small boy to carry home, that its great forked tail might trail on the ground, while its head played hide and seek over his left shoulder. There are other tricks than those of "Ananias' art" in the angling trade. Does George remember when the wear and tear of those Laurentian rocks wore away the leather soles so that his feet fell through his shoes, and like the bravest hero at Valley Forge he went forth daily to do battle with bass, pickerel and muscallonge, and never a complaint? For the delights of this Severn River region are very seductive, and few who visit there are not ensnared by

"LONGING FOR A 'LUNGE."

its manifold charms. Don't you remember the good-natured Rosselle, and how days spent with him were enjoyed? and days bereft of his kindly companionship seemed lost days. When he first arrived in this delightful angel land he said to me, "You know that I don't care anything about fishing; don't care anything about it and don't care to learn. I'll lounge around and rest and read while you fellows fish." I am reminded of Goldsmith's swains:

"Truth from his lips prevail'd with double sway,
And fools who came to scoff, remain'd to pray."

I felt sure that if some old-time blackened and bronzed bass would get at one end and this selfsame Doctor at the other end with the gentle tie that binds a light silk line and slender steel rod—the electric thrills would come trooping up that line and down the rod, and on down his spinal column, and a glorious conversion would follow, and it did. He first tried his hand at angling where the murky waters of Grass Lake pour a wealth of worms, bugs and other marine life into the lap of the Severn River. Where the fish came to feed we came to fish. I soon saw that a bass was nosing around Rosselle's bait, and in due season he struck, set the hook, and the battle began. The line fairly twanged with the strain as the fish telegraphed himself through the water, and the reel fairly screamed as if afraid the prize would not be taken. With a wild rush the fish dashed 2 feet clear of the water, and we saw for the first time the princely proportions of the gamy bass. Here is where the Doctor was converted. He yanked that struggling bass into the boat with the same zest that a hungry goat munches tender celery tops. From this time forth the Doctor went after the fish hammer and tongs, wisely concluding that if he had a life a little longer than Methuselah's he might waste some vacation days in his declining years in reading, especially when too old and rheumatic to get into a boat. That night he entertained us all with the triumphs of the day, and as he bade me a cheery good-night he added, "If you're waking, call me early."

At an hour so early that it seemed to me the middle of the night, he ruthlessly dragged me from a warm, comfortable bed down over grass, every blade heavy with dew and every weed and branch a shower bath. When I sat down on the boat seat I fancied I sat on a watering trough. As we moved from our mooring a white, silvery mist muffled the landscape a mile deep. As we rowed up the river the coming god of the day sent his dutiful daughter Aurora to weave with yellow mesh a gauze of

"IT WAS A LIKELY LOOKING PLACE."

shining gold around every floating gossamer of dew and with deft fingers she cast the shuttle of light forth and back, changing the hue from yellow to gold and from gold to crimson and purple, and the big pine tree at Bowers Bend stood bedecked with jewels and ornamented as for a Christmas for the elusive sprites of the woods. From behind this curtain of crimson and gold smiled forth as lovely a landscape as any angler may ever hope to see. The contour of the river and rock came up through the mist and we watched the charm of its coming as eagerly as the photographer watches the outlines on the dry plate after the developer is on. The river bends itself into long reaches of gentle curves, and at the big bend, where long lines of overhanging trees adorn either side, the river slips under the bridge and glides away only to lose itself in the softly pictured wood where Monahan's big pines stand like giants silhouetted against the sky. What a peace came to us that morning as we basked and dreamed in the quiet of the river. Gentle reader, you of disturbed rest and troubled life—you upon whom the burdens of life rest heavily—you who are weary of hand and heart and brain, why don't you seek some lonely Canadian River and let its gentle spirit of rest and quiet be upon you, and you will experience a freedom from worry and care that the "lotus eaters" never knew.

Amid such charms I admit it would have better harmonized with our finer feelings to have loosed the captive fish in our livebox, and to have given the fish food and drink, but nay, verily, we had brought along a basket full of succulent worms packed in moss, and we picked out them of most tempting figure for our first cast. At home we are wont to despise the worm, but up here where bass govern the Dominion and supreme courts adjourn in his honor, blessed, yea thrice blessed, is the man who has brought along a barrel of them. He will have every angler for his dear friend with whom he is willing to whack up his worms. For be it known that a big, fat, juicy worm with a rich, red belt around the waist is the bait par excellence for Ontario bass. We trolled up and down a swift current and found the sport fine. In the swiftest water we got the pickerel, and in the eddies below found plenty of waiting bass. Again and again we hooked bass and pickerel, getting some and losing more, for in swift water you must strike quick, and in so doing lose many fine fish.

I caught two pickerel all scarred and cut, and so weakened that there was very little fight left in them. Some of the wounds were a good half-inch deep. I have taken many pickerel in this region with old-time scars and a dozen or more with fresh ones. I once saw a very large 'lunge chasing a belated pickerel, and fancied this was the cause of many of the scars; for the muscallonge is the shark among other fish, often attacking bass as you haul them in. Just above this current I hooked a fine bass of a pound or more, and hauling in, a musky disputed my right to this fish, and as a result I added a 10½-pound 'lunge to my list of prizes.

As we float down the current, Rosselle suggests breakfast; but I hate to neglect duty "when bass are jumping crazy for the fly." Lusty-lunged Lige with a big conch shell chased echoes up this river for two miles, announcing breakfast, and the supreme pleasure reflected in Rosselle's face showed that in imagination he was already feasting on ham and eggs, hot cakes and fried bass, but all at once that pleasure was changed into joy as a big bronzed bass galloped away with his bait and he and the bass were at it again hammer and tongs, and with chances of triumph equally divided. Go to breakfast! If I hadn't fairly dragged him from the spot he'd be there still.

Of all the glad days we spent there last season, the most delightful were in camp at the eastern end of the Ragged Rapids portage, some twenty miles down the Severn River in a region of utter loneliness. There is not a house after we leave Sparrow Lake. We carried a 12 by 14 wall tent and a very meager camper's outfit. Five of us carried cups with the handles off and other two flourished handles with the cups broken off. We pitched our tent a hundred yards or more from the beaten trail, in a little valley hidden away that we might escape notice of marauding Indians. So far away from civilization, we didn't relish the idea of having any of our scanty store stolen.

We pitched our tents near some overspreading pines, then made our beds, gathering plenty of the aromatic sweet fern. A bed of this 18 inches deep, with the last 3 inches of pine tufts and balsam twigs, makes a very comfortable place to sleep, soft and springy enough; but there is more dampness in the fern than in pine and balsam; for this reason we were too cold for comfort the first night in camp.

There were in the party Dr. Rosselle, of Homestead; Dr. Montgomery and Paul M. Collier, of Oakmont, Pa.; R. M. Davis, cashier of the Pennsylvania National Bank; Jacob T. Schellhaas, of Allegheny, Pa.; and chief among ten thousand, George Hamilton, an up-to-date youth of twelve summers, eleven and three-quarters of them spent in innocent mischief, and lastly, the writer. Roselle, Montgomery and I are no light weights. When we step on the platform, the scales groan. This condition has its advantages in this climate. No use coming here to fish unless you're big and strong—just can't pull the big ones out. Now with Collier and Davis it was different—entirely different—light. So light that both of them stuffed in a crack two-ply thick wouldn't keep injurious rays out of a photographer's dark room. Angling is no gentle art up here at the Ragged Rapids. To do any good at all these twain had to sort of splice themselves together and the rear splice carried heavy boulders as ballast, and then were able to drag out only middling sized ones. When you saw Davis' hat dance up and down like a flying jigsaw, his arms fluttering like a Dutch windmill and his slender body bent and twisted like a hickory sapling in a tornado, then we knew a big old bronzed bass bearing the battle scars of twenty years had come upon Davis alone and away from his Collier splice, and had started in for some fun, and you can bet there was high jinks in bass town then. When the fish was tired playing Davis, he lightly flipped out of the water, turned his forked tail up to his nose after the fashion of the impudent urchin in a back alley, winked his fishy eye and was gone to tell the joke to a waiting school below that clapped their fins and laughed for joy.

Davis came up the beach "with melancholy step and slow," muttering, "I juches! if I'd only weighed a pound and a quarter more I could a-fetched it to," and whispers were heard of a monster windlass, and with this the brownies were going to fetch them home. But all jokes aside, the clear heads, sound judgment, kind hearts and willing hands of this slender twain were the sheet anchor of the party, and we never even crossed a wide stream without consulting their wishes.

After dinner the first day Montgomery, Davis, Schellhaas and Hamilton fished down along the shore of the rapids, selecting little circular bays and eddies, and what an afternoon for fishing it was. No one waited over a minute or so for a bite. All were kept busy baiting hooks, fixing reels and lines and unfastening the lines from sunken timbers and rocks, and begrudging every second taken to change hooks, put on bait and make repairs. Big catfish would occasionally make off with the bait, and though they are as game a fish as may be found, still we wanted bass and were disappointed when pickerel came struggling into the landing net. Occasionally a big muscallonge would grab the bait and then there was sport

BAITING FOR BASS.

royal, but these usually broke away from us in this swift water. Dr. Rosselle and I took our boat a mile up the river to McDonald's Rapids. On our way up we ran the nose of the boat on a sunken rock. It was a likely looking place. Twenty feet away there was a bay filled with wild rice and rushes. We jointed our rods to try results. We had brought along a basket of large dew worms a friend in Toronto had sent, and this bait suited the bass that day. I cast off first and immediately hooked a 2-pounder near the edge of the weeds; and Rosselle cast just below and our lines crossed, but his fish swam back and unloosed the tangle, and we drew them in together. A piece of twine tied to a piece of pine shingle made our stringer. In an hour we took probably twenty-five bass. The first six we strung; but the struggles of the last loosened the stringer from the gunwale of the boat and we saw them wabbling off through the water, pushing the pine shingle with them. We calmed our conscience by concluding they would eventually free themselves. We loosed anchor and trolled up and down in some weedy bays that fringe the left-hand shore going down, with the hope of taking a monster muscallonge. Although many heavy fish have been taken here, the best we could do was one small one. We then rowed up to McDonald's Rapids and fished in circular bays, where the waters rush round and round, and here again we found the fishing splendid. When

bass are biting, this lower Severn River furnishes as good fishing as may be found in the Dominion. We did not count our catch—merely landed them and threw them into the water again; but we caught probably 100 bass that afternoon. Not bad for two rods. While fishing my line tangled in the reel, and thrice, while loosening it, I caught bass on a small piece of worm, and finally in sheer desperation I threw my hook high and dry on a rock, while I untangled my line. While bass may have eyed it longingly, none ventured to crawl up the bank to purloin it.

Near where I fished there was a large crack perhaps 2½ inches wide and 6 inches deep running from the water's edge back into the granite rock. I caught a bass, laid him in the water in this crack, head toward shore, and he never made a move to get out. I caught three other bass and kept them in that crack like cattle in a stall for at least two hours. They moved forward, but never backward; even when only a little over one-third of their bodies was in they seemed powerless to get out. I very much doubt if a bass can move backward at all. Perhaps some fellow angler has noticed this fact and can add his testimony or test the truth of my statement by trying it.

At 7 P. M. we had supper of fried bass, and if you like bass rare done you can always have it; for in camp it is rarely done well.

After supper we recounted the triumphs of the day, and all agreed that it was a day long to be remembered. Schellhaas built a rousing camp-fire, and although we were in the heart of the Canadian wilderness, a region infested with bears, wolves, lynx and other wild animals, yet no one seemed uneasy.

At 10 o'clock we went to bed and were lulled to sleep by Mother Nature's own slumber song, made by the manifold voices of the rushing, beating waters of the Ragged Rapids, and our dreams were sweetened by the incense of pine, balsam and fern, and we all slept soundly until the coming sun sprayed the tops of the old pines and cedars with a mist of gold.

Montgomery volunteered to get breakfast, and it was one of the best meals of the season. After breakfast we all fished up the river, but with rather indifferent success. The fish refused to bite, as was their wont the day before; of course we caught more than we could use. Rosselle and I did considerable trolling for muscallonge, but were unable to even get a strike.

We came to camp early, and all hands turned in and helped with dinner. After dinner we all fished down at the foot of the Ragged Rapids. Here the waters come down this narrow gorge, boiling and fretting themselves into fury—wild as an avalanche of snow, and just as white. The falls are caused by a drop in the bed of the river of 100 feet in about an eighth of a mile, and it seemed as if some Titanic hand had cleft the sheer walls of granite that the pent-up waters might be freed. Where the water rushes round and round in circling eddies we found the fishing fine for bass, pickerel, muscallonge and channel cat. At this rapid Dr. Rosselle caught a bass of perhaps a pound and a half, and as he drew his prize to shore a giant muscallonge darted from under a rock, swallowed the bass and galloped away with it. Fifty feet from shore old "musky" dashed out high above the raging waters to relieve his overloaded stomach. The Doctor tried to lead him in toward the shore, yelling at me to come and gaff the beast. Just as he got the 'lunge to a shelving rock that ran down into the water, the fish disgorged the bass, and the rushing waves threw it into a niche in the rock 8 inches up out of the water, and *mirabile dictu!* that fool fish ran his nose up that rock and thrice snapped at the tempting morsel, and then darted away. The recurring waves dislodged the bass before we could secure it, and the fish floated off, bleeding from the three gashes down the sides and apparently quite dead. This is no very unusual thing for muscallonge to take captive bass, but unless the bass is lightly hooked through the lip the 'lunge frees himself by disgorging.

I saw an angler catch a 17-pound muscallonge that had gorged a captive bass here. After Rosselle's experience I fastened a large spoon on my silk line; casting well into the raging waters that went thundering by like wild white horses coming down the home stretch at a county fair. My spoon sped away a hundred feet or more, and I moved over and reeled it in through the eddies. For a half-hour I cast off and reeled in, longing for a 'lunge to take hold. While yearning for a battle with a big one, Rosselle took a snap shot, which shows the rapids just as they emerge from the gorge. To my left are the eddies in which the 'lunge come to feed.

While I was angling close up to the rapids Montgomery fished to my left in a circular bay, trolling with a quarter-pound live bass he had hooked (the fish mentioned earlier in this narrative).

My! it was a splendid fish, and for a while it seemed as if he should land it. It rushed hither and thither in the eddies, but finally swung so heavily on a taut line that Montgomery just donated 15 feet of his valuable silk. Being a minister, he said nothing, but what he thought will never be known.

Rosselle and I then fished up the right bank of the narrow gorge, and where there was a bay or even the appearance of one—just enough to make an eddy and furnish a place of rest for the bass—we found the fishing fine. As the Doctor was baiting for a bass, I took a snap shot that shows the wild waters of the gorge, and the dangerous descent he and I made to reach likely bays.

Up to this time our lad Hamilton had done nothing to distinguish himself in the Canadian wilderness, and felt he must do something historic to link his name to the legends of this wild country. He did. While fishing he tumbled headlong into the raging rapids and was fortunately washed into an eddy that threw him near enough shore to be dragged out. He then saw the tip of his fishing rod and gamely dived in and recovered it and again came out safe. A few inches further out, or an unfortunate movement of the undertow, and he would have been hurled down the gorge and his body might have been wedged under a rock and never recovered.

At 7 P. M. we had supper, and Hamilton and Rosselle took a very hazardous journey down the gorge for channel catfish. Although the moonlight was exceedingly clear, and as it always is in this North country, yet I was glad when they wandered into camp at 10 o'clock.

We gathered another supply of pine tufts and made our last night in camp the most memorable. At 8 next morning we had our luggage packed, and on pulling away from camp we said never a good-by nor an "au revoir," but fervently spake "Auf Wiedersehen."

In an hour we were over the McDonald's Portage and fishing at the head of the falls. Where the waters first break we found splendid fishing. We saved six of the best bass we caught and carried them home to our families at Sparrow Lake.

At the First Portage, eight or ten miles from home, we had dinner. Here in a quiet little nook, just below a fallen hemlock, whose green branches played up and down the eddies, and under the shade of a big pine, we caught eleven beautiful bass. They were mottled as prettily as trout.

The remainder of the distance was splendid muscallonge fishing, and my companion and I were determined to carry into captivity one of the largest in the region. Although we trolled in and out of every weedy bay, we took only one mean, measly little 'lunge no larger than a good-sized trout.

At 7 o'clock our boat grated at the landing, and we returned safe and sound to our families. This was Schellhaas' first experience roughing it, and I fancied he did not like it. The other day I met him in Pittsburg and asked, "Schellhaas, what was your most delightful experience in Canada last year?" His face shone with the honest emotion of the Teuton as he said, "I had my best time in the little old tent down by the Ragged Rapids, and I find myself thinking of those delightful experiences every hour of the day."

The time of our departure was drawing nigh. Thousands of guests were hurrying southward with the haste of feathered tourists in autumn, but we had gathered our store of health and strength, and a wealth of pleasant recollections that abide with us still like the memory of a pleasant dream, and form the basis of a lively hope that next year we may come again.

Allegheny, Pa., Dec 11. James M. Norris.

Onondaga Anglers.

Syracuse, N. Y., Dec. 18.—*Editor Forest and Stream:* The Anglers' Association of Onondaga has sent to the Board of Supervisors its annual report for the fiscal year of 1899, which reads as follows:

Gentlemen: One year ago your honorable board appropriated $200 to be expended by the Anglers' Association of Onondaga for the purposes of fish protection and propagation in the public waters of this county. We therefore desire to place this report before you that you may be informed of the manner in which the money has been expended and the work that our Association has done with the aid of your appropriation.

Our last report to your honorable board was for the year ending Nov. 30, 1898, and showed no balance of your previous appropriation on hand. Since then we have continued to employ Wm. Everson as protector, and we have also continued our work of restocking the lakes and streams of the county with game and food fish. The salary and expenses of our protector and our expenditures in the transportation and planting of fish and fish fry have aggregated $539.53. Of this sum $200 was paid with the fund appropriated, the balance from the funds of the Association. There is, therefore, no part remaining of the amount set aside by your board for our use. All has been expended for the purposes for which it was designed, and in addition thereto $339.53 of our own money derived from the dues and contributions of our members.

During the year ending Nov. 30, 1899, our protector has been employed continuously except during the months of January, February and March. A summary of his work is as follows:

Number of miles traveled	2,656
Fyke nets captured and destroyed	25
Gill nets captured and destroyed	8
Trap nets captured and destroyed	5
Flat nets captured and destroyed	1
Seines captured and destroyed	2

Total number of nets captured and destroyed, 41, the aggregate value of which was $336.

Number of persons arrested for violations of the law, 17; number of convictions, 13; aggregate of fines, $595.

Our Association has received from the State during the past year and planted in public waters, 3,000,000 pike fry, 48,000 yearling and fingerling brook trout, 39 adult brook trout, 26 adult brown and rainbow trout, 25 adult black bass and 11 adult pike. The total of 98 adult fish named above were those exhibited at the State Fair in September last, which were given to our Association and planted in the Geddes Brook, Nine Mile Creek and Onondaga Lake. This is the second time the exhibit at the fair has been turned over to our Association, and it a fortunate circumstance that places them in our hands, as the few adult fish that we have thus been able to put in our waters are more valuable so far as breeding and propagation are concerned than as many thousands of fry.

Adding the number of fish planted last year to those reported to your board during the two previous years that we have been engaged in the work makes a grand total of 6,940,000 fry, and 64,060 adult and yearling fish. Of these 6,925,000 were food fish, and 79,060 were game varieties. We are planning to continue this work with an enlarged scope during the next year, and expect to cover streams and waters that we have as yet been unable to reach, and we would repeat the request made in our report last year, that if any member of your board knows of streams that are adaptable to restocking we shall be glad to have their advice and will follow it so far as we are able. It will be remembered that these plantings have been made not for the benefit of the few, nor for the sportsman and angler, but are made in waters only that are open to all people, and are for the good of everybody who may desire to take the fish in a lawful manner for either food, sport or recreation.

Hand in hand with the restocking of the waters goes the necessity for their protection from the depredations of unlawful fishermen, who in their selfish greed would take and destroy everything, by any means, for the transient gain of a few in reckless disregard for the future or for the rights of the people to whom the waters belong. The urgency of protective laws is recognized by all enlightened governments, our own among the foremost, and the recent public utterances of Governor Roosevelt upon the subject show the regard in which they are held by the chief executive of this State. Our Association is also planning more extensive measures in this respect for the coming year, during which we shall devote our energies, our time and our money to the protection of the people's rights and the upholding and enforcement of the laws that are upon the statute books of our State.

Our Association is not composed of wealthy men, nor is our treasury well provided with the funds necessary to carry forward this important work, and we appeal once more to your honorable board for the aid and assistance you have so liberally granted us in the past. We thank you for what you have done; we ask that you will again at this session set aside for this purpose a sum not less than that you have appropriated heretofore. If you can find it within your means and your judgment to make the appropriation larger at this time than it was last year, we assure you that it will all be economically and carefully applied to the public good and for the benefit of the people alone to whom it belongs. Very respectfully yours,

The Anglers' Association of Onondaga.
George B. Wood, President; John H. Forey, Vice-President; J. E. Bierhardt, Secretary; Charles H. Mowry, Treasurer; R. V. Miller, Chairman Executive Committee.

By a vote of 31 to 3 the Board of Supervisors this afternoon adopted the resolution presented at a previous secction by Supervisor Rubin, appropriating $200 to the Anglers' Association. There were present in the interests of the Association, Riley V. Miller, George B. Wood, John C. Bierhardt, S. T. Betts and Charles H. Mowry. Those voting in the negative were Supervisors Shaver, Hoffman and Breitschwerth. G. B. W.

As to Eels.

Happening casually to pick up a copy of your interesting paper of July 1 last, my eye fell upon an article on the subject of eels from the fertile and ever welcome pen of Mr. A. N. Cheney. From long and close observation of the habits of this most mysterious fish, I have learned some facts and formed some surmises concerning them which may prove interesting if not convincing to some of your readers, and with your permission I relate them as briefly as I can.

From Mr. Cheney's article I learn that some modern European icthyologists have reaced the conclusion that the eel is an oviparous fish—spawning in salt water, like marine fishes. Years have elapsed since I had the honor of being a pupil of the celebrated Joseph Leidy, and consequently it is with much hesitancy that I presume to put my humble opinion in conflict with that of the modern expert histologists, yet I am strongly inclined to the belief that their conclusion will not apply to the American eel. I now allude to the anadromous and migratory eel, having for its habitat the waters of the James and Potomac rivers, in Virginia. However, it may be possible that the European fish has a mode of generating its kind different from its American congener. Although not thoroughly convinced, yet I am strongly inclined to suspect that the eel I am now writing about is an ovo-viviparous fish, like the shark and some other fishes. I will state the facts and hypotheses upon which I base my conjecture.

A score or more of years ago I was angling for trout in the Jackson River, one of the principal tributaries of the James, in Highland county, Va. I was fishing near the source of the river, where the eels and trout most do congregate. Returning to my quarters late one cloudy evening in the month of August, my course lay along a path on the banks of the stream in which I had been fishing. The stream at this point was deep, narrow, clear and swift, and much broken by little falls. At a point where the path I was following crossed the creek I was compelled to leap the stream in order to continue my journey on the opposite bank, and as I did so I noticed something of a white color waving in the water, resembling a newspaper or white handkerchief. Having my curiosity excited, I laid down my rod and creel and lay down upon the bank of the brook in order to get a nearer view of the object that had attracted my notice, for it was then nearly dark. As I did so imagine my intense surprise and astonishment to find that what I had mistaken for the objects above alluded to should turn out to be a great mass or aggregation of eels wrapped and twisted around one another like a rope and slowly turning from side to side, with their heads all up stream—the white appearance in the water which had attracted my attention being caused by the white bellies of the eels as they were turned toward the light during their revolutions in the water. Unfortunately, owing to the darkness, I could not ascertain what they were doing in this singular attitude. Had I been able to determine whether these fish were spawning or copulating, the question of the generation of eels, which has confounded philosophers for several generations, would have brought this most difficult subject near to a definite conclusion. I can hardly think they were spawning, for no eel ova or young eels have ever been met with in such localities, as far as I have been able to learn. If they were engaged in the act of copulation, why then the conclusion that the eel is an ovo-viviparous fish would be inevitable.

Although I had never met with this singular aggregation of eels before (nor have I since), yet I have been informed by eel fishermen that they had met with such phenomena while spearing eels late in summer on dark nights. Although it cannot be positively proven, I nevertheless think that one would not be far wrong in suspecting that the eel is an ovo-viviparous fish; that the females are impregnated late in summer and on dark nights near the sources of our rivers, whence they proceed in autumn to our salt water bays and estuaries in order to give birth to their young.

But here another difficulty meets us: What becomes of the eel when it reaches salt water, for I have heard averred that no one ever met with a gravid eel? Well, I can only answer this very formidable and quite pertinent query by offering an hypothesis, which may or may not be attended by some elements of probability, and this is

that the eels probably continue their migration until they reach deep water (in winter), where they are not likely to be molested by seines or other nets, where they give birth to their young and where the young remain until they reach a size and strength which will enable them to perform their annual and vernal migrations to the sources of the rivers.

I have now told what I know and don't know about this most mysterious subject of the generation of eels and will turn to several other topics touched upon in Mr. Cheney's interesting communication, such as the migration, locomotion on land, etc., of eels.

As regards the migration of eels, I have to say that these fish leave the sources of our rivers during the freshets following the first frosts in autumn, usually in September and October. At this time they have attained a length of 2½ or 3 feet (not 4 or 5 inches, as stated in Mr. Cheney's letter), and a weight of 2 or 3 pounds. This autumnal migration is almost invariably performed on dark nights when the water is muddy. Immense numbers of them are now caught by the dwellers on the banks of the rivers by means of traps or weirs, conveniently termed "pots," and now commences a season of great joy and feasting, for the flavor of our migratory eel is preferred by many to that of even the famous fontinalis himself, being quite different in this respect from his white, insipid cousin, who seems to dwell perennially in the salt or brackish water. I will here remark that it may be the spawn of this salt water eel that the European naturalists—referred to above—profess to have found floating about in the salt water. And I would like to inquire in this connection whether any of this salt water spawn has ever been hatched artificially, for this would settle the question as to some eels being oviparous, at once and forever. I also wish to observe that I am not a little puzzled to comprehend what the naturalists aforesaid mean by the term "larvæ" as applied to vertebrate animals. But no doubt I am a "back number," not having studied histological subjects for some years.

To resume my story of eel migration. It is not a little singular the manner in which the eels enter the pots or weirs. They do not come in head foremost, as one might suppose who is not acquainted with their habits in this respect, but always tail foremost or sidewise, with their heads up stream. This is done, no doubt, in order to let the water pass through their gills in the natural manner. Now that the eels have reached the salt water, I will have to bid them good-by until spring.

The young eels, or elvers, as I believe they are called in the "old country," arrive from the salt water during the freshets of April if the weather be suitable. After they have reached a point of, say, a hundred miles above salt water they have attained a length of about a foot and a thickness of a medium-sized little finger of a man. At this time they are perfectly voracious, and give great annoyance to the ground fishermen, as, owing to the smallness of their mouths, they are most difficult to hook. About a fortnight after the young eels have passed on their journey up the river, the old and full-grown eels commence biting, and here another difficult problem confronts us. Have these adult eels also returned from the salt water, or have they remained in the fresh water throughout the year? And this seems to be another one of those things that "no fellow can find out." But there is one thing, however, that I am perfectly certain of, and that is that some eels remain in the fresh water during the whole year, for I have taken an occasional eel in winter in mill ponds fed by spring water. These have always been of very large size, and may be, as some aver, the barren eels, which never leave fresh water.

Eels seem to grow very rapidly, as the young eels, by the time they have reached the trout streams, a couple of hundred miles further on, have about attained their full growth.

As to another interesting matter referred to by Mr. Cheney—that of the ability of the eel to travel overland—there can be no doubt about the matter, as I have had ocular evidence of this performance on the part of the eel in several instances. Once I had captured some eels in my pot which I put in a barrel two-thirds full of water, the barrel being placed upon the sloping bank of the creek in which I had caught my eels. Going in the morning to get some eels for my breakfast, I found, much to my surprise, that my fish were missing. Thinking that some one had stolen my eels, I determined to watch my barrel. Placing some more eels in the same barrel about daylight, I concealed myself in a position where I could see my barrel without being seen myself. I did not have long to wait until the loss of my fish was fully explained. In a few moments flop! came an eel out of my barrel, and wriggling down the sloping grassy bank of the stream was soon lost therein. Another and another soon went through the same performance. Being desirous of ascertaining precisely how this singular acrobatic feat was performed, I approached the barrel cautiously and peeped over its edge. Soon I noticed the tail of an eel above the surface of the barrel. The tail was then uplifted until it extended over the edge of the barrel. Then by a sudden vigorous movement the fish threw itself not only out of the barrel, but several feet beyond its base. A second eel went through a precisely similar performance, but the third lifted itself out in a manner which was truly remarkable, and one which I think may throw some light upon the mode in which the eel surmounts obstructions while ascending rivers. This eel, instead of bending its tail over the rim of the barrel, as the others had done, slowly swept its tail around the surface of the barrel until it found the interstice between two staves; it then inserted the sharp edge of its flattened tail in this depression, thereby gaining a purchase by the expression of the air apparently, when it also left the barrel. Who would have thought that the eels understand the properties of a vacuum? These eels did not move down to the margin of the brook in an undulating, up-and-down movement, like a caterpillar, as some say, but wriggled from side to side, like a snake.

I will relate another instance of the powers of locomotion on land of this fish, and then bring to an end this rather prolonged essay. When a boy, I lived upon a farm upon which there was a pond fed by springs, a small rivulet leading from the pond to a brook a few hundred yards off. This rivulet sometimes went dry after a prolonged drought, and I have several times captured eels making an effort to reach the brook along the dry bed of the rivulet. This was always during the autumn, when the eels were no doubt obeying the imperative migratory instinct.

ANGLING NOTES.

Italian Gut.

Spanish silkworm gut is generally considered of better quality for fishing purposes than Italian gut, though the latter is often in longer strands, but thinner than the Spanish gut. There may be such a thing as first-class, thick, Italian gut, heavy enough for salmon leaders, but I have not seen it, although I sent to Italy to get some gut as good as could be found.

I have just read an article about the manufacture of gut in Italy, and it differs in one particular from the process employed in Spain, so that I make an extract from it:

"Some of the inhabitants of the Island of Procida, in the Bay of Naples, manufacture very fine gut from silkworms. They call the product silk threads, their special properties consisting in their strength and flexibility. They are made from the stomachs of silkworms just before they begin to spin their silk and form their cocoons. Not many worms in proportion to the amount of the gut put on the market are reared in Procida itself, but the makers buy them from neighboring towns in large quantities. The following is the process of manufacture: The worm is selected when fully matured—that is to say, at the moment when his nourishment ceases, and just before his metamorphosis. He is then cut open, great care being taken not to injure the membranes of the stomach. This is removed, and usually reaches the length of 13 to 20 millimeters, with a diameter of 1½ to 2 millimeters. The stomachs are then put into a pickle, which is the keynote of the whole process and the secret of which is carefully kept. When the pickling process is over the work people, who are mostly women, take one end of the stomach with their teeth and draw the other end with their hands. This part of the work requires great dexterity, for the threads are drawn out to the length of 30 to 50 centimeters, and the whole value of the product depends upon its length in relation to its thickness and the strain it will carry.

"There are two seasons for the production, namely, in the spring, when the best gut is produced, and in the autumn, when the quality is inferior. There is an important market for this specialty, and the whole production is exported to northern Italy and abroad at the the average price of 150 lire per kilo" (say about $16 per pound, which seems to the purchaser of gut at retail in this country as if the figures were wrong). "The gut is of very small specific gravity, so that a great deal of it goes to a kilo. The cost of production is also considerable, as the worms must be bought just at the moment when they are coming into profit for making silk. Again, the results are frequently disappointing, many worms being found, on dissection, not to be suitable, and have to be discarded."

It would almost seem as though the writer had written carelessly when the Italian process of drawing gut as he has given it is compared with the Spanish method. In Spain the silkworm itself, not dissected, is placed in vinegar just at the time that it is ready to spin. Afterwards the head of the worm is removed, exposing the ends of the two silk sacs, not the stomach, which are then drawn out, stretched on a board and fastened at the ends and allowed to dry. When dried on the stretching board the gut has a yellowish skin, and this was formerly removed by women, who drew the gut through their teeth; but now it is mostly "bleached" by chemical action of some sort, which on occasions, as I know to my sorrow, impairs the strength of the gut for leaders.

I cannot understand how silkworms can be dissected as the writer I have quoted describes, and for this reason: The silk sacs of the silkworm at the time that gut is drawn consist of two thin lobes or capsules of a liquid substance about an inch long and one-thirty-second of an inch in diameter, lying longitudinally in the body of the worm, and the worms are put into vinegar for the purpose of partly solidifying the crude silk in the sacs that it may afterwards be drawn to make the gut of commerce.

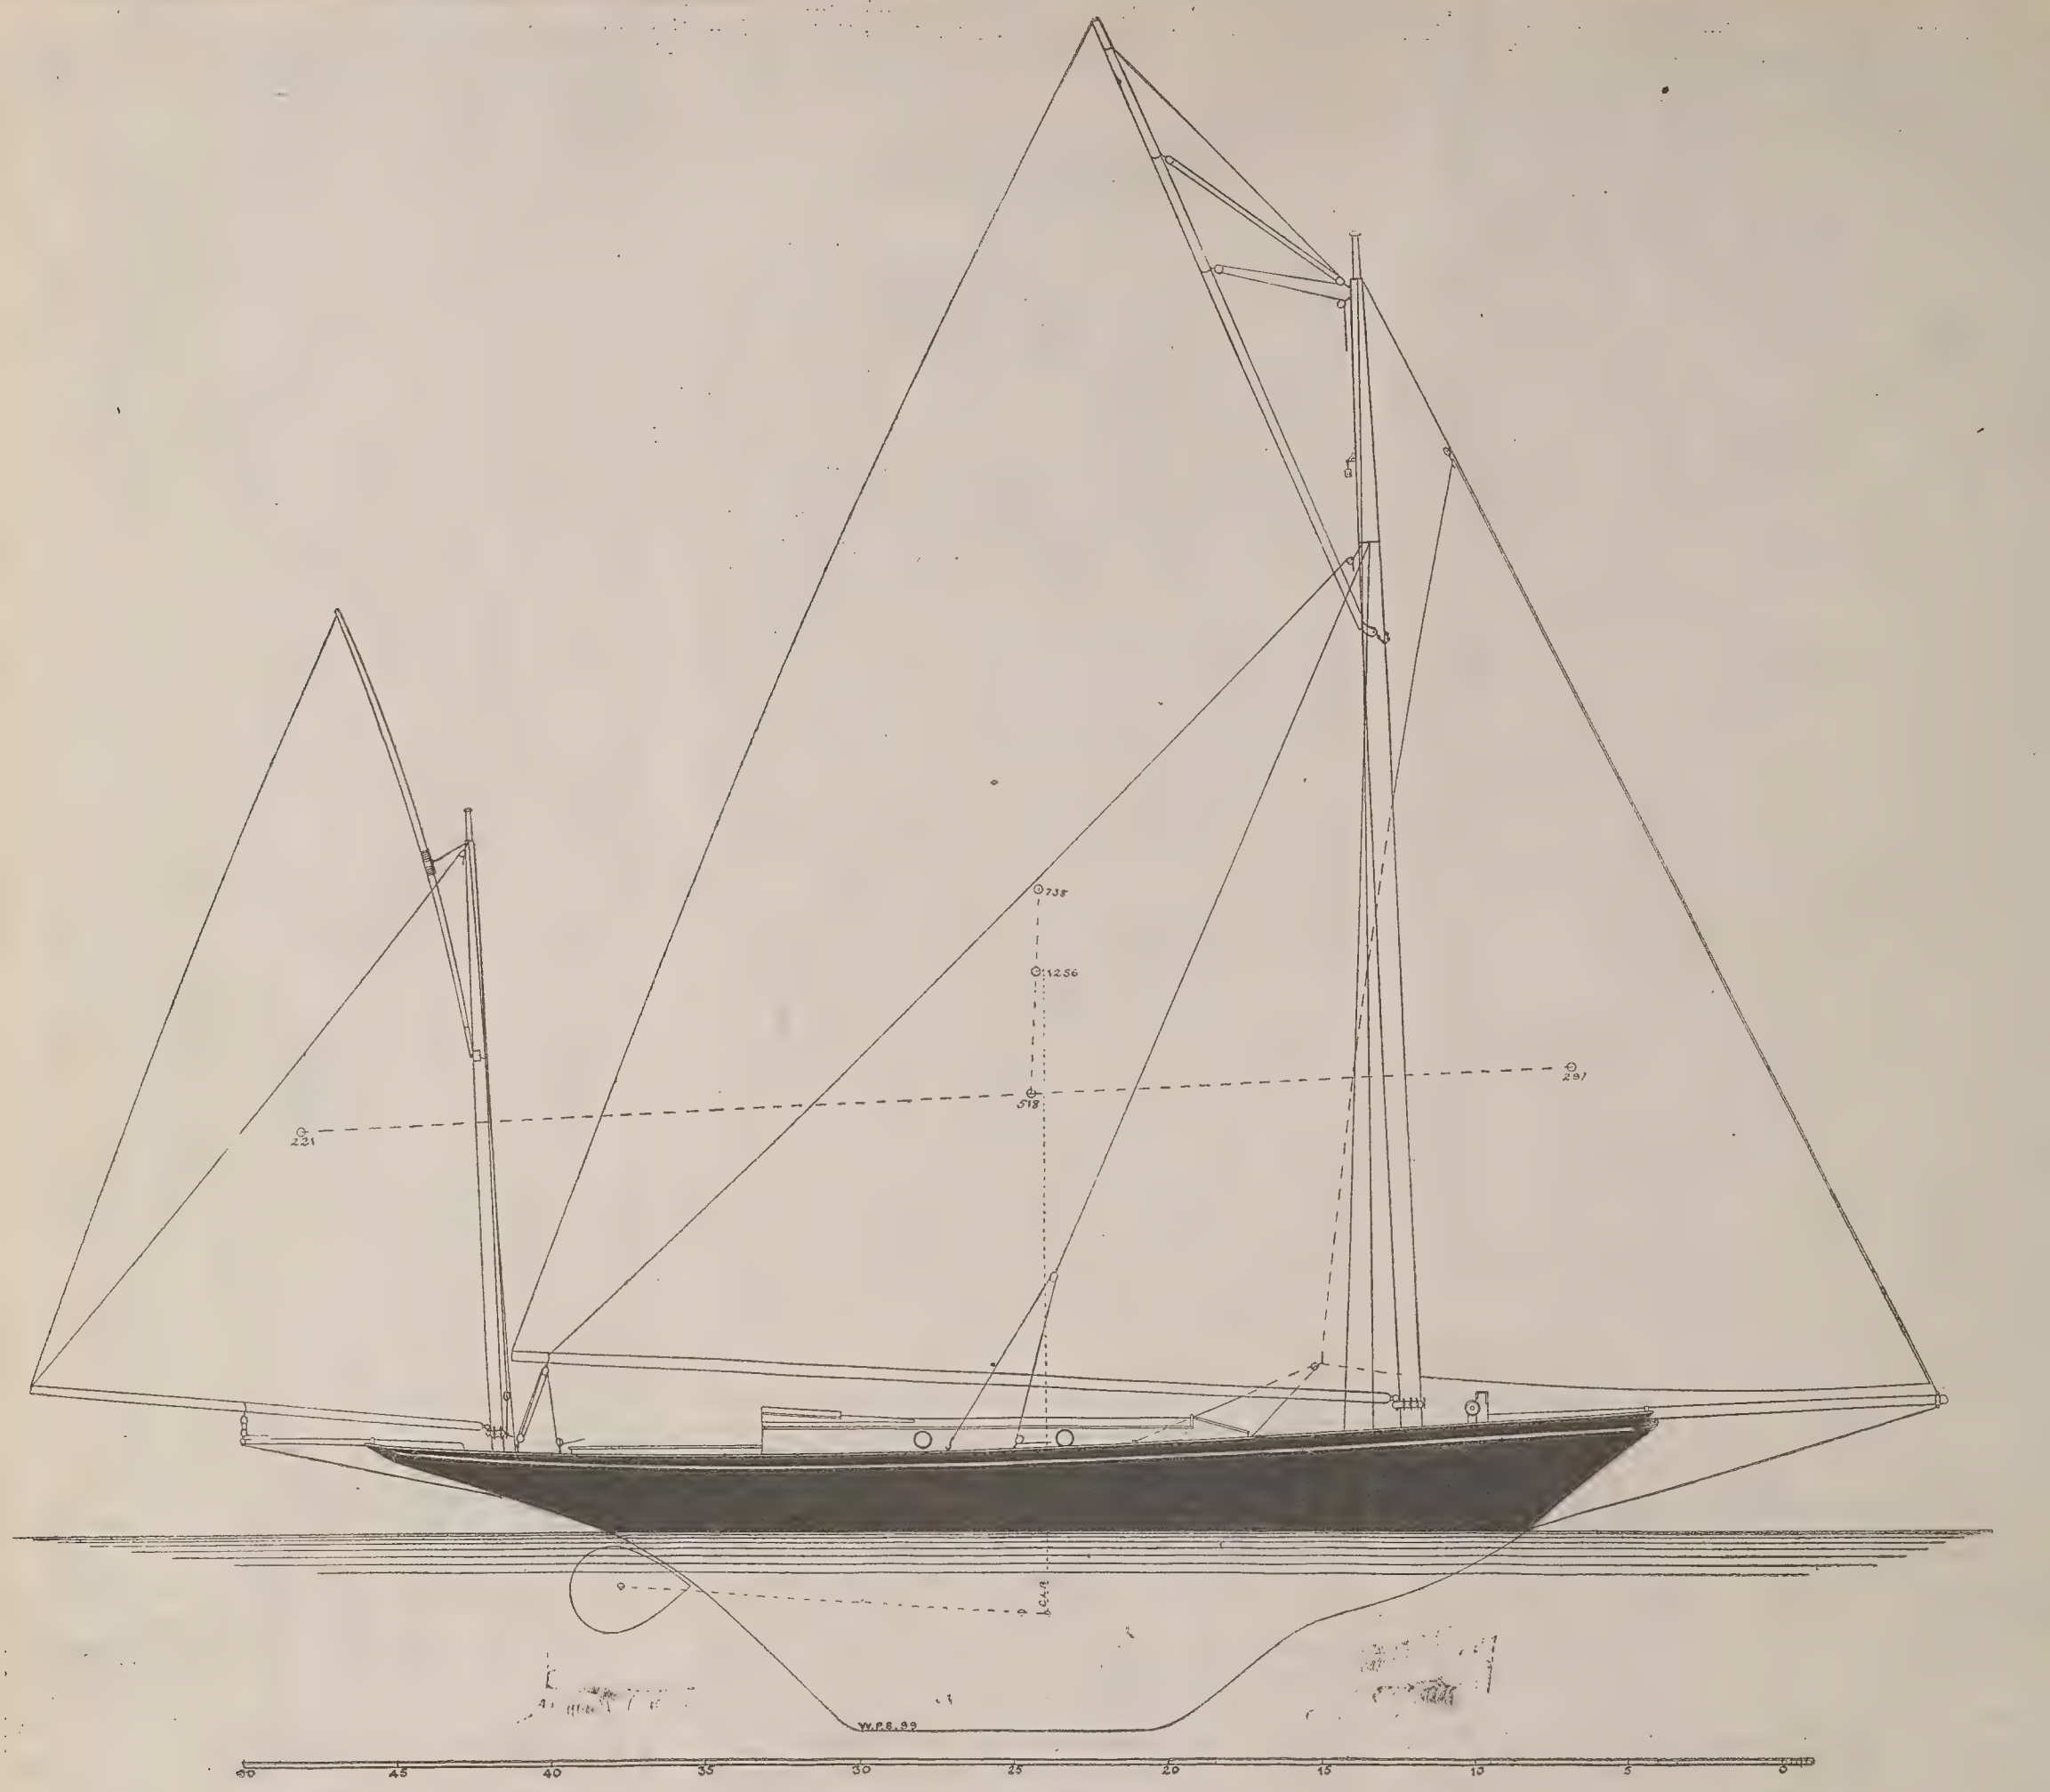
Of the "bleaching" of the gut, Mr. Marston once wrote: "A manufacturer informed me some time ago that there was no difficulty in getting gut like glass, but that the dealers would not buy it unless it was bleached, a process which impairs its strength, and he sent me some strands from which the yellow skin had merely been peeled off, instead of being removed by chemicals. This gut was as transparent as the purest glass." He then asks the question why some of that really transparent, unbleached gut is not put on the market.

All gut is not transparent, as described by Mr. Marston, when peeled and unbleached, for I have peeled it myself and found it opaque, but less glossy or glittering than some of the bleached articles. Foster puts the gut of different countries down in the following order, the best being the Spanish, the next Indian or Chinese, and the poorest Italian. If any one ever discovers proper food on which to feed the American silkworm to give the gut strength, the best gut for fishing purposes will be American.

Illustrations.

Possibly my education has been sadly neglected in matters pertaining to art, but the impressionist school in my estimation is not one, two, three when compared with the realistic for the purpose of illustrating sporting subjects, and I never could agree with a well-known artist whom I called upon to get a painting of a certain fish when he said he would paint a fish's tail on a frog if it were artistic. I have had something to do with black and white and color drawings to illustrate fish and fishing, game and shooting, and once when I had struggled for months to get the drawings, in colors and black and white, for a certain volume absolutely correct, and had caused an artist to change his drawings several times to get reels in the right place on fishing rods, and setters or pointers for woodcock shooting, instead of fox hounds, I was not particularly well pleased to have the publisher write me that he was short two drawings, and had supplied them, and he thought I would find them all right, as they were made by a good artist. When the volume appeared, one of the drawings as reproduced represented a deer hunter shooting at a deer, while a pointer (with a collar on in thick woods) stanchly pointed the deer. The other drawing was a fishing subject, and an angler was represented in the act of landing some impossible fish, and to make sure of his catch the angler grasped the rod with one hand about a foot above the reel, and while the other hand grasped the middle of the second joint, and the man was pulling as if it were a tug of war. When I saw the two creations I wished that green monkeys might dance on the artist's grave when he was through with the affairs of this world. It may be hypercritical to say that I do not consider a brook trout fishing article well illustrated that shows a man fishing a mountain stream with a 200 salmon rod; and the same is true of a drawing showing a salmon fisherman in a birch bark canoe fast to a fish with all the strain he can put on his rod, apparently, and the bowman ready with gaff, while the stern man sits with his paddle across his knees. I sent this drawing back to the artist and told him if he was on speaking terms with the stern canoeman, to put his paddle in the water and see if he could compensate for the strain on the rod so the canoe would not whirl as though it were on a pivot, otherwise the angler might lose his fish. Also, in the case of a man drawn with his gun at his left shoulder, I said that a few men did shoot in that way, but I thought it would be more familiar to the readers of the book if the man shot from his right shoulder, and for the same reason I asked him to cause one of his figures to use his reel with his right hand in reeling a fish, although some men do reel with the left hand. I can recall many more of what I consider slips on the part of an artist friend of mine, but what I had in mind particularly when I wrote the head of this note is an excellent half-tone now before me, which I found in a magazine said to be devoted chiefly to angling. The mechanical work could not be better, and the figures are excellent, but the artist has placed two good looking anglers in jeopardy of their lives. There is a strong rapid in a stream, and the rapid furnishes rocks. There is a boat containing three men, apparently two anglers and a guide. The boat is a flat-bottomed craft, and it is being run through the rapid at a critical moment. The guide sits in the bow with a paddle, and the boat is going through the rapid stern first. Both anglers are standing up in the boat and each has a fish on his rod; one fish, judging from the bent rod and taut line, is up stream just around a bend, the other is down stream, and the boat is very close to a rock on one quarter, and if it escapes that one there is another below waiting for it. I defy any one man, except possibly a river driver, to stand up in that boat with no fish to distract him, but to put two men in the boat is to invite certain destruction. I showed the picture to my daughter as a handsome piece of mechanical work, but her comment was: "I hope those men can swim, for they will have a chance in about a minute." Why not have correct illustrations, giving details of drawings as they should be, and not impossible situations and impossible fishing and shooting implements, and even impossible figures? Illustrations are supposed to be an aid to the text and not to mislead the reader. A painting was sent to me that I might write the text to accompany it, and as a terrier was painted in the picture to be used as a retriever of wild fowl, I suggested that the breed of the dog be changed, but the artist did not like the suggestion even a little bit. A column of FOREST AND STREAM could be filled in relating the misfit illustrations of sport that have come under my observation during the past few years.

A. N. CHENEY.



The Quick and the Dead of a Laker.

FROM the records of many cases of alcoholism, the one strong fact is made certain that always in the individual when an excess of a stimulant causes a striking change in the mentality and personality, yet each and every time are the same symptoms produced. It matters little how many years have elapsed between the times of such sprees, alcohol in any form will give rise only to well-marked peculiarities of sensation, motion, speech, hallucinations and irritative nervous disturbances. Of my readers I crave pardon for dipping into professional experience, and alone do so in order to bring out the thought, that if men are thus held dominant by conditions, so in their turn and in their own way are fish influenced by the state of the waters, by the method of capture, by the lure used and by the season of the year. No better illustration comes to me than the following attempts to show how utterly different the same fish can act when his environment, more or less, is a controlling factor. So will I call these memories Chapters I. and II., relating my experience with the familiar chap called the togue, or the laker, sometimes I fear having been passed off as a trout by some when relating the size and weight of a catch.

Chapter I.—The Dead.

It is now several years ago when I was first introduced to the togue. A friend, a dear, good-hearted, generous and delightful sportsman, told me, while I was at his camp, that in a lake some four or five miles away there were plenty of togue to be taken; and he even went so far as to trust to my care and keeping a rod as strong and beautiful as used for salmon, but much stiffer. The reel was a large one, with plenty of line. He also gave me a weird and strange combination of hooks, in clusters of three, some twelve in all, I think, strung on a strong, stiffened gut, at varying distances, on which I was told to fasten a live minnow. I knew nothing at all about the togue, or laker, and asking for information gained these points: The fish in this lake are large; they take the bait fiercely, and then dive to the bottom by a quick run, where they sulk for a time, and have to be coaxed to the surface.

I started with a supply of provisions, for two or three days would be needed to conquer this variety of fish, and there was only a log cabin to provide shelter at the other end of the camp; and I confess I was a bit scared at the prospect of a battle. However, after a delightful tramp through a beautiful forest, where the fallen leaves made walking most agreeable, and where the effect of sun rays through the network of brilliant green gave keen pleasure in the blending of sunlight and shadows, a rippling brook over moss-grown stones provided a sparkling, satisfying draught, and the happy

AUDAX, YAWL, DESIGNED BY JOHN HYSLOP, ESQ., FOR HENRY W. EATON, ESQ., 1892.

chirpings of feathered warblers, or the crash of an old-time monarch of the forest, as the echoes of its fall were thrown on the still air, broke any monotony that might have existed otherwise—the new home was reached safely. Then after lunch, putting my tackle together, and selecting a good sized live minnow, I hung it up on the mass of hooks, and seating myself in a fairly comfortable boat, was pulled out into the lake by the guide. I tried to remember all details. A good length of line was let out, and then I waited. Suddenly a sharp pull was felt, I struck deep and hard, and away went the line, my reel singing its joyous whirr. Now, thought I, a big one has my minnow. But he never seemed to reach bottom nor anywhere else, and most of my line had gone, so I had the guide stop rowing, and even then I could not feel any decided movement at the end of the line, so began to reel in, and after a deal of labor found I had caught strongly and well an old water-logged trunk of a tree. It took a long time to get free, but I renewed my bait and tried it over again. This time I did get a fish. True, he did go to the bottom and hump himself a bit, but he was "dead easy" to reel in, to lift into the boat and to kill.

I discarded my nightmare of a study in hooks, and my guide constructed one of three single hooks, that held a live bait securely. I caught togue—had to catch them in order to have food supply; but I never found one that gave a decent fight. I grew tired of them; ate all I could, began to hate them, and had the guide make pancakes out of flour, but did have real maple syrup on them. Once two togue were taken, from the same minnow, each being caught by one of the hooks spoken of, but it was only a haul; neither had any nerve, and both were pulled by hand into the boat, for I did not trouble to use the net.

So this sort of thing went on. One afternoon a terrific thunder storm broke, and most of the rain fell on me, and only made my disgust the stronger. It was late in June; the flies never bit better or more smartly. I did have fifteen minutes' fun with a trout which was kind enough to take my trolling bait. It was a godsend, and I enjoyed both catching and eating it. But my hate grew stronger every hour; every togue sulked, made no decent rush, was utterly stupid, and I gave it up and went back to my camp, where I could have splendid, glorious trout fishing. I vowed I never, never would be fool enough to even try any more togue fishing; and for some time after this, if I heard togue or laker spoken of as being in such a pond or lake, I rushed elsewhere. Such were my introduction and deductions regarding the laker.

Chapter II.—The Quick.

Early in springtime, so soon that the water itself to the touch seemed as if it ought to be frozen instead of being fluid. The air bracing. The winds strong in their blowing. Power, endurance and skill requisite for the guide who managed the canoe. A phantom minnow provided with only one hook, or a live minnow or strip of pork on a single hook, with sometimes a flashing spinner just above the bait, served as a taking attraction. Trolling with two rods was exciting sport, and while I naturally wished for landlocked salmon, I secured many fine lakers. But I did not know my old acquaintance. In the chilled water he was a fish of a different color and mood. Baits were strongly taken, and his rushes resembled those of a favorite and noted football hero. Proudly would he tear about, at times shaking his head fiercely in his attempts to get free. He cared less for the bottom than he did for the middle of the lake, and equaled the landlocked fellows in his wild turnings. If he had only learned in his young life to make a leap from the surface it appeared to me his gamy battling would have nearly equaled that of the "little salmon." So I had to change my mind utterly, for now I was perfectly willing to class him with game fish; and I believe he is such under the right conditions I have pictured, I like him now as much and as fervently as once I hated him; but I should not try to capture him when the water grows warmer, or the air is too balmy; for then would I be sure that only the sulky, lazy, pulling back, humping capacities would manifest themselves, and that I might swear and of a surity lose valuable time. *"Experencia docet."*

F. M. JOHNSON.

BOSTON, Mass.

The Christmas Tree and the Forests.

SING SING, Dec. 23.—*Editor Forest and Stream:* From my office window I have an unobstructed view of the N. Y. C. & H. R. R. R. tracks. For the last two weeks carloads after carloads of young spruce, pine and hemlock trees have been rushing by toward the city to fill thousands of homes with joy as the little ones dance around the Christmas tree. The rooms ordinarily cheerless, the streets bare of a vestige of vegetation, the little tree with its fresh resinous small permeating the atmosphere and with its sparkling decorations puts a cheer into the home and into the hearts of the little ones as long as it remains. On the other hand, certain lumber has been advanced from $18 to $26 per thousand this year, with the promise of a like advance next year. Is this not a terrible destruction of trees? The sentiment is fine, but can our forest stand this drain? Forty years from now these trees would have been far enough advanced in growth to be of use for building purpose. You are advocating moderation bags in fishing and shooting. Why not take up this matter before it reaches the possibility of being the cause of a famine in lumber? I have two little boys who annually enjoy their Christmas tree, so I am able to see both sides of the case.

CHAS. G. BLANDFORD.

Florida East Coast Fishing.

BISCAYNE BAY, Fla., Dec. 19.—The kingfish seem to be a little late this season, but are now being taken in large numbers on the reef off Cape Florida, and afford excellent sport. Some good catches of Spanish mackerel reported from the lower bay opposite Soldier Key.

That "Carted Deer."

Editor Forest and Stream:

What are the facts as to the carted deer that is regularly "hunted" by "the Queen's buckhounds"? In a general way I have the impression that the safety of the stag is carefully provided for, and I remember once seeing reference to the deer hunted by his name—"Old

——," I fancy—and mention of how often he had been chased.

I suppose that the deer's safety is provided for by some such means as shelters to which it can run, with watchers stationed near by to close the door when the deer enters the shelter. It is possible that the hounds may know the deer so well that they will not attack it on overtaking it, although it would seem that in such a case the deer would know the hounds also, and would not make much of a run, and I would very much distrust any hounds when they run into their game after a long, heated chase.

Our old friend, Geo. H. McDougall, wrote me that the pack of American bloodhounds at the Deer Lodge, Mont., Penitentiary were very friendly with all the "trusties," but when on an exhibition chase after the same trusties, got so savage that the trusties finally refused to "run out" for the hounds, and I know that the big mongrels of many breeds used with the play of "Uncle Tom's Cabin" got so interested in their work, that Cassie refused to play until other dogs were procured, as a very light slip would have brought the dogs on her with murderous intent. Parenthetically, our Southern friends are very much astray in blaming Mrs. Stowe's novel as the origin of the myth that "ferocious bloodhounds" were used to capture fugitive slaves in antebellum days; that work does not contain any scenes of the use of hounds. It seems to be a fact, although not commonly known, that there are individuals who leave no scent by which they can be trailed. A curious experiment would be to mount one of these non-scent leaving persons on the same bicycle that the hounds had previously trailed another person on, and see how long, if at all, the bicycle would give out the rider's scent. That our native hounds will follow a trail of a rider of a bicycle, whose individual scent had been given them, was proved beyond dispute at the trials last year of the American Bloodhound Association, and also that the hounds would take a scent, follow it where the person mounted a horse, where he had changed horses without dismounting, and where he dismounted and walked to and climbed a tree. Scent problems are utterly puzzling. It was shown beyond denial in Rod, Gun and Kennel some years since that a scent would become indistinguishable when the ground it was made on froze up, and would be in full force when the ground thawed. And is it exactly correct that scents will not lie on all dry ground? May it not be that dry, porous, ground, clay, loam, etc., will not hold scent because they occlude it, as does the dry earth in the well-known "Mowle" earth closet, or the familar instance of burying skunk tainted clothing to remove the odor? Is it not probable that scent will lie on stone or dry sand? I know that I have many a time known hounds to pick up a fox trail on a hard, dry turnpike.

But where have I got to? What are the facts as to that "carted deer"? W. WADE.

OAKMONT, Pa

Points and Flushes.

We are indebted to Mr. H. B. Donovan, Secretary-Treasurer of the Canadian Kennel Club, for one of its new bronze medals, very artistically devised in its details and very complete mechanically. The obverse side has a blank space for the inscription, while the reverse side has a number of dogs' heads, representing various breeds, bearing a typical resemblance to the breeds which they represent.

Yachting.

The Lake Michigan Yachting Association.

21ft. Waterline Knockabout Type Adopted by the Lake Michigan Yachting Association.

AT its annual meeting, the Lake Michigan Y. A. adopted the following limitations for a knockabout class, the first recognition of this type on the Lake. The yachts called for by the limitations will be superior in many important respects to the various small craft now in use, and probably quite as fast. The class promises to become popular, and a number of boats will be built in Chicago and Milwaukee.

A boat of this class is intended to be a seaworthy boat with cabin house and fair accommodations, with water tight standing room, or air tanks of sufficient capacity to float the boat when full of water. Rigged simply with only mainsail, forestaysail or jib and spinaker.

The length of the load waterline with full equipment shall not exceed 21ft.

The beam at the load waterline, in keel boat, shall be at least 7ft., and in centerboard boat at least 7ft. 9in.

The freeboard shall be not less than 20in. on the said respective required beams; a reduction of 1in. on the freeboard allowed for every increase of 4in. in beam, respectively.

The cabin house shall have a length of at least 7ft., and a width equal to 60 per cent. of the greatest beam on deck; a height at the forward end of at least 6½in., and the after end of at least 9in. above the deck; provided, that in case the freeboard exceeds the requirements, such excess may be deducted from the required height of the cabin house.

For centerboard boats the draft shall be not less than 3f.. for at least 5ft. length of keel; the total outside fixed ballast must be not less than 3,000lbs. For keel boats the draft shall be not less than 4ft. 6in., and shall not exceed 6ft., and the outside ballast shall be not less than 3,500lbs. Certificate of weight of ballast shall be furnished the measurer by designer and builder. The metal fin when used shall be not less than ½in. in thickness.

The keel, stem, frames, house and deck beams shall be of oak, or its equivalent in strength.

The frames shall be not less than 1 sq. in., deck beams not less than 1 1-3 sq. in. sections, house beams not less than ¾ sq. in. section.

The spacing of frames, deck and house beams to be not more than 9in., center to center.

The planking, including deck and the side of house, shall be not less than ¾in. thick; the top of house shall be not less than ⅝in., finished.

Deck clamps shall run from stem to stern, with a minimum cross section of 4 sq. in. for at least one-half the length; also, bilge stringers of at least 4 sq. in. cross section shall run for at least one-half the extreme length of the boat, amidships. Clamps and stringers to be yellow pine or its equivalent in strength.

The actual sail area shall be not over 600 sq. ft. and not more than 480 sq. ft. of actual sail area shall be in mainsail. The measurer shall be provided with a correct sail plan of any boat to be measured, and previous to measurement the owner shall cause distinguishing marks, satisfactory to the measurer, to be placed on the spars as follows:

On the mast at the tack, and at the throat of the mainsail; on the boom at the clew of the mainsail; on the gaff at the peak of the mainsail. No part of the mainsail shall be allowed to extend beyond these marks. The marks shall be black bands painted around the spars in a manner satisfactory to the measurer. The inner edge of the bands shall be the limits of the sail.

The actual area of the jib shall be measured.

The extreme distance in feet from mast to end of spinaker boom when in position as used, shall be not more than 500 divided by the distance in feet from deck to throat of spinaker halliard block.

No battens over 30in. in length allowed to be used in sails.

Equipment to include anchor not less than 25lbs. and cable of not less than thirty fathoms of 1¼in. rope; also bucket, pump, compass, foghorn, boathook, lead and line, lantern and five life preservers.

The crew is limited to five persons, including the helmsman (who must be an amateur; not more than one shall be a professional).

Audax.

THE accompanying illustration shows the sail plan of Audax, whose lines have appeared in the two preceding issues. The rig is simple, easily handled by a small crew and it has proved effective. The original sail plan included the regular lug mizzen with yard crossing the mast, but after a couple of seasons this was replaced by the lug mizzen shown, the yard, which has about 6in. round, being attached to the mast by a special metal jaw, which allows it to hoist almost vertically. The halyard is a single part of wire rope running over a sheave in the masthead, with a whip purchase leading to the deck. The dimensions of spars and sails are as follows:

Mainmast—		
From stem at waterline	3ft.	9 in.
Deck to hounds	29ft.	
Deck to truck	39ft.	
Diameter at partners		8 in.
Mizzenmast—		
From stem at waterline	33ft.	6 in.
Deck to hounds	20ft.	
Diameter at partners		5 in.
Bowsprit—		
Over all	15ft.	9 in.
Outside of gammon iron	9ft.	10 in.
Diameter in gammon iron		5 in.
Boomkin—		
Over all	7ft.	
Outside gammon iron	4ft.	3 in.
Main Boom—		
Length	29ft.	
Diameter		4½in.
Main Gaff—		
Length	22ft.	
Diameter		4 in.
Mizzen Boom—		
Length	15ft.	
Diameter		3¼in.
Mizzen Yard—		
Length	15ft.	
Diameter		3¼in.
Areas—		
Mainsail	738 sq. ft.	
Mizzen	221 sq. ft.	
Jib	297 sq. ft.	
Total	1,256 sq. ft.	

Inland Lake Yachting Association.

THERE was a meeting of the Board of Directors of the Lake Geneva Y. C. on last Thursday evening. It was decided to make arrangements for the meet of the Inland Lake Yachting Association for late August in the coming year, at Lake Geneva, Wis. The committee are expected to hustle, and a grand event will be assured. The following are the committee appointments. Chairman Regatta Committee, Julian M. Rumsey; Chairman Committee on Arrangements and Accommodations, Ben Carpenter, of George P. Carpenter & Co.; Executive Committee, H. H. Porter, Jr., Ben Carpenter and Julian Rumsey. Chairman Press Committee, Lawrence Heyworth.

E. H.

YACHTING NEWS NOTES.

The Atlantic Y. C., of Boston, elected the following officers on Dec. 17: Com., Thomas D. Rice; Vice-Com., Walter Delehanty; Treas., William Caselden; Sec'y, M. E. Rice; Directors, Daniel J. Nolan, James Dooley, James Hagerty, J. F. Curran and J. F. Donohue.

At the annual meeting of the Pavonia Y. C., of Jersey City, Com. D. W. Kohn declined the nomination for a third term, and Vice-Com. Dennin was elected in his place, the new officers being: Com., J. A. Dennin; Vice-Com., A. C. Muttart; Fleet Capt., John Wright; Meas., W. Harding; Fleet Surgeon, Dr. D. Bowman; Cor. Sec'y, C. H. Benson; Fin. Sec'y, W. F. Tobin; Treas., Louis Mittlesdorf; Trustees, Alex J. Roe, N. F. Roe, E. J. Smith, C. H. Benson and F. G. Agens. It is proposed to sell the club property at Atlantic Highlands and to build a club house on Gravesend Bay.

The Knickerbocker Y. C. held its annual meeting at the Hotel Manhattan on Dec. 20, the following officers being elected: Com., S. H. Mason; Vice-Com., W. G. Newman; Rear-Com., A. E. Williamson; Treas., George H. Cooper; Sec'y, J. O. Sinkinson; Meas., J. G. Honey; Fleet Surgeon, J. B. Palmer, M. D.; Board of Five Directors, F. E. Barnes, Rodman Sands, H. Stephenson, L. Lochman, Jr., and H. A. Quackenbush. The club is now in a very prosperous condition. The property now occupied has been purchased and a fine new club house will be built. The club will establish a new class of single-hand yachts for racing and cruising.

The Gas Engine & Power Co. and C. L. Seabury & Co. have on the stocks a composite steam yacht for Howard C. Smith, of Stamford, Conn., to be named Saghaya. She will be 127ft. over all, 103ft. l.w.l., 15ft. 6in. beam and 6ft. 6in. draft, with triple expansion engine and single screw. The rig will show two pole masts. The firm has also an auxiliary 65ft. long for Wm. Marks, of Philadelphia. Through its city office, it has sold the steam yacht Jathniel for H. A. Hutchins to Chas. M. Pratt, and the steam yacht Elfrida II. for Dr. H. Seward Webb to Frank Bement, Corinthian Y. C. of Philadelphia.

The Morris Y. C., of New York, held its annual meeting on Dec. 18, electing the following officers: Com., George R. Moran; Vice-Com., Hugo Eckert; Rear-Com., William Neubeck; Fleet Capt., J. Belgard; Sec'y, F. Kuzek, Jr.; Treas., Ralph Kestler.

Sapphire III., steam yacht, Mr. Amzi L. Barber, sailed from New York on Dec. 21 for Gibraltar, where her owner will join her for a cruise of several months in the Mediterranean.

Com. J. Pierpont Morgan has declined a third re-election as commodore of the New York Y. C., and it is understood that Vice-Com. Lewis Cass Ledyard, schr. Montauk, will succeed him. According to an unverified rumor, when Com. Morgan goes abroad next spring, as he proposes to, both Corsair III. and Columbia will be sent across, the steam yachting convoying the cutter.

Grayling, schr., L. A. Fish, has at last been sold to be broken up, after being used for several years as a houseboat at Greenport.

Mr. J. H. Johnston, the yacht photographer, died very suddenly at Niagara Falls on Dec. 17, from heart disease. Mr. Johnston had been in business in New York for many years, accumulating a large collection of yacht portraits. He also made a specialty of views about the city. Many of his pictures have appeared in the FOREST AND STREAM.

Sir Thomas Lipton has been elected rear-commodore of the Royal Ulster Y. C. He is now considering his plans for a challenge in 1901.

Mr. Percy Chubb, cutter Vigilant, has been nominated to succeed Com. Rouse, of the Seawanhaka Corinthian Y. C.

Arcturus, steam yacht, Mr. Rutherford Stuyvesant, has sailed from Southampton for the Mediterranean.

The large racing yacht which the Hendersons have just started from Mr. Watson's designs, for Mr. Whitaker Wright, will be yawl-rigged instead of cutter, as first reported. Her L.W.L. is given as about 85ft. with about 23ft. beam.

Lasea, schr., recently sold to Dr. Walter von Bruening, sailed from New York for Southampton on Dec. 25 with Capt. Leander Jeffries in command.

Canoeing.

Forest and Stream and Canoeing.

Announcement.

To meet the wishes of its canoeing readers, as expressed through the officers of the American Canoe Association, the FOREST AND STREAM will with the new year inaugurate an important change in its Canoeing Department. Beginning with the issue of Jan. 6, 1900, the first number of each month will be a special canoeing number, extra space being devoted to the Canoeing Department. It is proposed to publish whatever may be available in the line of canoeing news; the official announcements and programmes of the American Canoe Association, the usual complete reports of the A. C. A. camps and business meetings, designs of canoes and camping appliances, canoe cruises and current discussion of canoeing matters.

As a part of this plan, it is not proposed to abandon the regular weekly publication of canoeing news. All official A. C. A. notices will appear weekly, as soon as they are received, a summary of them being printed in the special Canoeing Number for the information of those who do not see the weekly edition. If sufficient material is obtainable after providing for the special number, the publication of canoeing news of all kinds will be carried on weekly.

It is hoped that the FOREST AND STREAM may become, as it was in the most prosperous days of the Association, the common bond between the Association and its members, as well as between the members individually. In order that the plan may result in the greatest possible benefit to all, it is essential that it shall receive the general support of canoeists, both as subscribers and contributors.

An experience of twenty years has demonstrated several important points in connection with the publication of canoeing news. In the first place, a live and reliable canoeing journal is essential to the success of the sport, as a means of communication between its followers, who

are naturally widely scattered and have limited opportunities for personal intercourse.

In the second place, the various papers devoted exclusively to canoeing, such as the parent of all, the British Canoeist, the American Canoeist and Sail and Paddle, and the Model Yachtsman and Canoeist, all ably edited by experienced canoeists, who gave their services without compensation, have failed to pay, and have ultimately been discontinued.

The failure of these papers, in spite of their technical excellence, and at times when the sport was in a more prosperous condition in some ways than it is to-day, gives ample proof that if canoeing news is to be published at all it must be largely through the personal efforts of the canoeists themselves. The FOREST AND STREAM is ready to do all that can be done on its part; but this alone will not provide what we believe canoeists want. A Canoeing Department which is the work of one man—or even of several men—however competent, would fall far short of what is required; in order to satisfy canoeists, it must be a reflection of the canoeing spirit in all its forms. We call the special attention of all canoeists to the fact that the Canoeing Department of the FOREST AND STREAM is open to them for the free expression of their opinions and ideas, for the discussion of all A. C. A. business, for requests for information as to cruising waters, canoes and appliances, and all technical points of immediate interest to themselves. On the other hand, we ask that they will favor us with canoeing news from their various localities, and that they will give such information as they may have in answer to the inquiries of others.

Rifle Range and Gallery.

Cincinnati Rifle Association.

CINCINNATI, O.—The above association held their regular shoot Dec. 24, at 200yds., at the standard American target. Roberts was high on the king target with a score of 84. Gindele was high on the honor target with a score of 43:

Champion score:										
Weinheimer	5	6	5	7	6	5	7	9	6	5—61

HARRY SPERLING.

Excelsior Rifle Club.

ST. LOUIS, Mo.—Below please find inclosed scores for weekly medal shoot of Excelsior Rifle Club, at Capt. Schaaf's Shooting School, No. 5 North Broadway. The shooting was done at a St. Louis ring target, at 75ft., possible 250: C. W. Bauer 225, W. G. Todd 212, A. Ruemle 201, Capt. Schaaf 201, L. Ball 192, J. Lukins 186, J. Summers 181, W. L. Schrader 168, L. Pabst 168, C. Northwang 164, R. Y. Cunningham 164, T. G. Kennedy 162, E. Renshaw 155, E. Tricky 148, C. Spencer 147, H. Hamilton 146, H. Ward 130.

The king shoot, which also took place last week, same evening, Dec. 14, resulted in Mr. Summers winning the honors of wearing the title of king for the next six months.

A 100-shot rifle match was to take place over the range of the Excelsior Rifle Club, at No. 5 North Broadway, Dec. 22, between A. Fogarty and L. Ball for championship of St. Louis.

Trapshooting.

Fixtures.

Dec. 31-Jan. 1.—Milwaukee, Wis.—Amateur tournament of the Wisconsin Gun Club. P. Himmelstein, Sec'y.

1900.

Jan. 1.—Altoona, Pa.—Fifteen-live-bird handicap; $5 entrance. G. G. Zeth, Sec'y.

Jan. 1.—New Haven, Conn.—Holiday shoot of the New Haven Gun Club. Targets. J. B. Savage, Sec'y.

Jan. 1.—Schenectady, N. Y.—Third annual tournament of the Schenectady Gun Club. Targets. V. Wallburg, Capt.

Jan. 1.—Newark, N. J.—All-day target shoot of the South Side Gun Club.

Jan. 1.—Jersey City, N. J.—Holiday shoot of the Hudson Gun Club. J. Hughes, Sec'y.

Jan 16-19.—Hamilton, Ont., Can.—Annual tournament of the Hamilton Gun Club; $1,200 in prizes. Open to the world. H. Hamilton Gun Club; $1,500 in prizes. Open to the world. H.

Jan. 17-18.—Danville, Ill.—Sconce-Cadwallader invitation shoot. Live birds and targets. John Parker, Mgr.

Feb. 13-17.—Hot Springs, Ark.—Third annual midwinter tournament; $1,000 added; 2-cent targets (Rose system) and live birds (high guns). Capt. A. R. Smith, Sec'y.

April 2.—New York Vicinity.—Interstate Association's Grand American Handicap. Edward Banks, Sec'y.

April 18-21.—Lincoln, Neb.—Third annual amateur tournament of the Lincoln Gun Club. Live birds and targets. W. S. Stein, Sec'y.

May 7.—Chicago, Ill.—Twenty-sixth annual convention and tournament of the Illinois State Sportsmen's Association. W. B. Leffingwell, Sec'y.

June 3-8.—Utica, N. Y.—Forty-second annual tournament of the New York State Association for the Protection of Fish and Game. Henry L. Gates, Sec'y.

June 5-7.—Columbus, O.—Ohio Trapshooters' League tournament. J. C. Porterfield, Sec'y.

June 11.—New York Vicinity.—Interstate Association's first annual handicap target tournament. Edward Banks, Sec'y.

June 19-21.—Charleston, W. Va.—Fourth annual tournament of the West Virginia State Sportsmen's Association, under auspices of Beechwood Rod and Gun Club. Added money and merchandise prizes. J. A. Jones, Sec'y, Charleston, W. Va.

Aug. 28-30.—Arnold's Park, Okoboji Lake, Ia.—Budd-Gilbert tournament.

Brooklyn Gun Club.—Third Saturday of each month, Francotte gun contest. Fourth Saturday of each month, Grand American Handicap free-entry contest.

Watson's Park.—Burnside Crossing, Ill.—Medal contest the first and third Fridays of each month.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have printed. Ties on all events are considered as divided unless otherwise reported. Mail allsuch matter to Forest and Stream Publishing Company, 346 Broadway, New York.

The following, taken from a Baltimore daily paper, treats of a rather peculiar complication in the trapshootoing contest, to which it refers, and while interesting in itself, is profitable in the way of something to file for future reference: "At the Monumental Shooting Association's grounds this afternoon the fifth shoot for the American Shot & Lead Company's medal will take place. This is at 15 live birds, each entrant having a distance handicap. It has been won twice by J. C. Hicks, once by J. M. Hawkins, and it has been won by Ansley H. Fox, but whether once or twice nobody can quite determine. He tied H. A. Penrose on one occasion for the medal, and at the next general contest for it won it clearly. Mr. Penrose had agreed to let the tie of the former race be settled by the result of the one at which Mr. Fox won, and if this was legal Mr. Fox won the medal twice. An argument was advanced that both victories could not count, because had the tie been previously settled Mr. Fox would have got a longer handicap, rendering more difficult his second effort to secure a victory for the medal. The reply to this was that when he shot, both to clear off the tie with Penrose and to make an original winning of the medal, he was still a non-winner until the match was over—and his handicap of 29yds. was correct. The question is not vital to the contest, for this particular medal, as Mr. Fox has temporarily retired from the traps; but it is interesting to shooters, who, frequently overtaken by darkness, agree to shoot off ties in future events. This system of penalizing of winners in handicaps is what gave room for doubt on this occasion. However, as Mr. Fox won the medal in a straight shoot on a satisfactory handicap, that event seems beyond dispute, and gives one winning. If this be so, and the right of tied men to shoot off, according to custom, at the handicaps at which they tied be not disputed, then Fox made the second winning, especially in view of the fact that it is impossible to handicap a contestant retroactively, or, in other words, handicap a man for an event of yesterday on form shown to-day. It was impossible, therefore, to penalize the tie race on the performance of shooters in the later event. The question, however, is interesting, and experience leads to the making of rules to settle disputed points. The medal shoot is open to all, and the trophy must be won three times to become permanent property. Should Mr. Hicks win to-day it would be a popular victory. Arrangements are being made for a series of contests at live birds to be held on the Monumental shooting grounds. The first will be held early in January, and the prize will be a handsome gold watch."

The Brooklyn Eagle will give a silver trophy, to be emblematic of the inanimate target championship of Greater New York and vicinity. Any person who resides within a radius of fifty miles of Greater New York's city hall, and who is a member of a recognized and properly organized gun club, is eligible to compete for the trophy. First contest will take place on Brooklyn Gun Club's grounds, Jan. 21, on which occasion there will be an all-day shoot at targets. The conditions of the trophy contest will be 100 singles, unknown angles, and 25 pairs, all targets thrown from expert traps, Sergeant system. This rule to be observed in all challenge contests after open competition. Entrance in open competition price of targets at 2 cents each, furnished by the club. Committee appointed by the Eagle to look after this competition is: Edward Banks (chairman), Dr. A. A. Webber and J. S. S. Remsen. There also is a live-bird challenge championship trophy under consideration, which will be purchased by subscription, open to shooters within a certain radius of New York, the conditions of which are not settled upon yet, but will be ready for publication soon.

The calendar of the Marlin Fire Arms Co., New Haven, Conn., is in keeping in artistic merit with their calendar of the past year, both having a just claim to artistic merit and a theme which appeals to all lovers of the gun. Concerning it, the Marlin Fire Arms Co. writes us: "This picture was painted for us by Prof. Edm. H. Osthaus, as a companion piece to our last season's setter design. The artist shows us a city chap enjoying a day's shooting with his Marlin repeating shotgun and a pair of beautiful pointers. To the lover of animals, Prof. Osthaus' bird dogs are always masterpieces, and in the present case he has added a background that is exceptionally effective, and the entire painting has an atmosphere often seen in a typical fall day. The coloring has just enough of the violet hue of the impressionistic school to be pleasing. The mechanical work gives evidence of the rapid advances being made in reproduction by color photography. We will be glad to mail one of these calendars to any reader of your publication sending one stamp to pay postage."

"The Book of Trains, Christmas Number," issued by the Lake Shore & Michigan Southern Railway, is one of the most artistic works ever issued by any railroad company. The cover has a picture, the theme of which is in keeping with the Christmas-tide—the three Wise Men of the East, Oriental in feature and costume, are giving their attention to the star which guided them to Him whose birth has caused a rejoicing which goes on and on through the centuries. A border of holly, the green leaves and red berries of which are quite realistic, gives a most appropriate setting to the picture and a wider suggestion to its theme. There are a number of interesting Christmas sketches, in prose and poetry, all very appropriately and pleasingly illustrated, the whole concluded with the words and music of a song, "Kriss Kringle's Drive." Four cents for postage, and a request for it to Mr. A. J. Smith, G. P. & T. A., Cleveland, O., will secure this very interesting Christmas brochure.

The calendar for 1900 of Messrs. E. I. Du Pont de Nemours & Co., 32 Pine street, New York, and Wilmington, Del., portrays a U. S. battleship in action, her guns, heavy and light, belching fire and iron at the Spanish fleet in its memorable attempt to escape. Its title "A Sunday Morning off Santiago." Shells bursting in air, men stripped to the waist, working at the guns, officers on different parts of the battleship scanning the fleeing enemy through glasses, water splashing from bursting shells, make a very spirited scene. The actual size of the grain of their brown prismatic powder, used in the 4, 6, 8, 10, 12 and 13in. breechloading rifles, and the actual size of grain of their smokeless powder, used in 10, 12 and 13in. breechloading rifles, are accurately portrayed. The doings of the powder in war, sport and the industrial world are set forth tersely on the leaves devoted to the calendar.

The passing away of Mr. John Hunter has caused the most profound grief to the host of friends who esteemed and loved him. The Hunter Arms Co., in the card which announced his death, gives a brief sketch of his charming character as follows: "It is with the deepest sorrow that we announce the death of our president, John Hunter, who went to his reward Nov. 29, aged seventy-one years. Father Hunter was a man whose whole life was a living demonstration of the practicability of the Christian religion in business affairs. Tolerant always, compromising with wrong never, just to all men, to know him was to love him. A man whose ideal life was elevating and lifted up all life with which he came in contact. Warm in his friendship, firm in his convictions, unwavering in his adherence to truth and justice. Surely his life is a goodly heritage."

There will be a contest for the championship of the State of New Jersey, of which the E C cup is the emblem, on Wednesday of this week between Messrs. Geo. H. Piercy, of Jersey City, and F. Widmann, of Trenton, the contest taking place at the latter place.

The Sing Sing, N. Y., Register states that "a new gun club has been formed by some of the cadets of Holbrook's Military Academy. Kennth McAlpin was elected captain. The club intends to co-operate with other military schools having gun clubs so as to promote trapshooting, and with the idea of petitioning the Sportsmen's Association to set aside a prize for interscholastic team races to be shot for during the sportsmen's show at Madison Square Garden. The managers of Holbrook's Military Academy are to be commended for their liberality and farsightedness in entertaining this new departure in school recreation. They recognize, as every one will, that there could be no more healthful pastime than shooting at the traps or afield."

In the Carteret Gun Club's Christmas Day contest the first event was the December cup, at 10 birds, 30 yds., $1; ties at 3 birds. There were eight contestants for this trophy, it going to Mr. Browne, who killed 9 out of 10 alone. The Christmas Day cup was at 10 birds, handicap rise, entrance $10, allowances 27 and 26yds., one miss as a kill, and one no bird; ties at 3 birds. This was won by Mr. Stuart, standing at 26yds. This event was open to the Westminster Kennel Club, Philadelphia Gun Club, Riverton Gun Club, Larchmont Y. C., Westchester Country Club, Tuxedo Club, Heron Hill Gun Club and Garden City Gun Club.

An exchange states that "on Christmas and New Year's days the New London, O., Gun Club will hold shooting matches that will furnish fun for everybody. There will be trapshooting, rifle shooting and wheelbarrow rolling for the turkeys. The rifle contest of pioneer days seems to be the coming sport in this part of the country, and is becoming a part of almost every contest among marksmen. Those with whom the shotgun is not a favorite can wipe up the old rifle and learn with the rest. Good rifle shooters are not easily found at the present time."

The calendar of the Union Metallic Cartridge Co., 315 Broadway, New York, is a radical departure in the way of its pictorial features, from what is commonly accepted as the standard themes. A majestic buffalo head, in a setting of prairie flowers and grasses, has a most pleasing effect. It is artistic in its conception and execution, and the buffalo head suggests a theme of what modern ammunition will do in the hands of skilled shooters—greater than all else in the history of big-game shooting.

The Brooklyn Gun Club will hold a big holiday shoot on New Year's Day, the special delicatessen being a $20 gold piece and a $10 gold piece, whose color is of the sunshine, and whose effects are still more of the sunshine to those who win them. Mr. John Wright has been ill at home for some days, suffering from a cold. He is missed much by his many friends in the gun colony, but as his illness is not serious—a bad cold—they have much to be thankful for.

The meeting of the Interstate Association was held on Thursday of last week, and its doings are set forth quite fully in the report of it in our trap columns. The annual report of the manager, Mr. Elmer E. Shaner, is worthy of the most careful perusal, for it contains much that is valuable in the way of information, and much that is valuable in the way of sound and good advice.

In the first of the series of five matches between teams of the Passaic City Gun Club and the Boiling Springs Gun Club, held on the grounds of the latter club, at Rutherford, N. J., last Saturday, the Boiling Springs Club won by the score of 201 to 156. There were twelve men on a side, each shooting at 25 targets.

The Hudson Gun Club will hold a New Year's shoot, and visitors are invited to attend it. Take yellow turnpike Newark car to Hackensack River bridge, and the grounds are only a short walk therefrom. This is a club of jolly fellows, and there is shooting to please the most exacting as to quality and quantity.

On Friday of last week Mr. W. L. Colville (famous in the world of writers as Dick Swiveller) left New York for Batavia, N. Y., to spend the holiday season at his home. He reports a very successful season in the way of business, and anticipates even a greater business year forthcoming.

The special shoot of the Emerald Gun Club last week for the benefit of the widow of the late E. A. Vrooms, who was an esteemed member and officer of the club, was unfortunate in respect to weather, the day being rainy and unfavorable for a large attendance.

Dr. and Mrs. Shaw, of the Garfield Gun Club, Chicago, contemplate a trip to the Yellowstone Park in the near future. The Doctor has an intention to hunt big game, traveling by stage into the country from Glenwood Springs.

Mr. H. J. Sconce, Sidell, Ill., informs us that the Sconce-Cadwallader shoot has been postponed from Jan. 17 and 18 to Jan. 23, 24 and 25. There will be two days at targets, 2 cents each, and two days at live birds, 15 cents each.

John A. Ruhle, of Beloit, Wis., after many months of illness, passed away from earth on Dec. 15. He was a contestant in the tournaments quite regularly some years ago, and was noted as a skillful and successful shooter.

The Chicago sportsmen's trophy, in the seventh contest for it, was won by Mr. R. Clempson, he killing 15 straight, and won the tie struggle for it. The contest took place at Watson's Park on Friday of last week.

The match between Messrs. S. Van Allen and Albert H. Laney, members of the Aqueduct Gun Club, Jamaica, L. I., fixed to take place on Dec. 19, did not take place.

Mr. Paul R. Litzke sends us an interesting summary of the doings of the O. K. Gun Club, of Kansas City, during the year just past.

The Fulton Gun Club will hold an all-day shoot at Old Mill, L. I., the last of the year 1899.

BERNARD WATERS.

Arkansas and the South.

LITTLE ROCK, Ark., Dec. 21.—Through the courtesy of Mr. Ed Hickman, the secretary of the O. K. Gun Club, of Kansas City, Mo., I am able to submit to the readers of FOREST AND STREAM the annual report of this energetic little shooting organization. The club held twelve shoots during the year, which were supposed to occur monthly, but during June, July and August no contests are held, as this is one of the few progressive clubs that is opposed to shooting pigeons in the middle of the dog days. In order to fill out the quota of twelve contests, two scores are shot during September, October and November.

That genial and consistent shooter Chris. S. Gottlieb carried off the honors for the season, having taken part in every contest, and showing the excellent percentage of .928. F. N. Cockrell, another one of the urbane squad, is close up to Gottlieb, with .891. His brother C. B. Cockrell also showed up strong, and finished third with .883. J. W. Bramhall is fourth, .881. A very handsome trophy goes to the winner. Each contest was at 20 live pigeons.

	Jan.	Feb.	March.	April.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.	Shoots thrown out.	Average.
C Gottlieb	19	19	19	18	20	19	18	20	15	18	19	17	0	.928

PAUL R. LITZKE.

IN NEW JERSEY.

Boiling Springs Gun Club vs. Passaic City Gun Club.

Rutherford, N. J., Dec. 23.—A team of twelve men of the Passaic City Gun Club met an equal team of the Boiling Springs Gun Club on the grounds of the latter to-day. This match was the first of a series of five. The time of the next contest will be published in due time. The shooting was particularly difficult, a stiff, in-blowing wind making harder the targets, which are always hard on these grounds. There were some preliminary events shot as a warming-up exercise. The match proper was started somewhat late, so that toward the finish the light had waned considerably. Each man shot at 25 targets. The scores:

Boiling Springs Gun Club—James 13, Matzen 16, Hexamer 13, Herrington 21, Frank 10, Paul 13, C. Collins 17, Burgess 17, E. Collins 21, Huck 19, Brockart 16, Pierson 14; total 201.

Passaic City Gun Club—Hall 14, Lenone 14, Platt 16, Jelleme 16, Abbott 15, Bowker 14, Ferguson 14, Bowers 14, Beatty 4, Coman 12, Toman 10, Wise 13; total 156.

Confabulations of the Cadi.—XXI.

New Year Resolutions.

"Then, too, the Old Year dieth,
And the forests utter a moan,
Like the voice of one who crieth
In the wilderness alone,
'Vex not his ghost!'"

THE Cadi, and the stanch companion of his hours of contemplation, Moke, sat in the lodge on opposite sides of the rough pine table, each occupying his chair after the reposeful manner of a bag of rags, as was the habit of these guzzler-mates in their daily companionship when at restful ease. A pitcher of cider and a couple of glasses on the table made much in common between them. That they were seated within the lodge denoted that the weather outside was not to their liking; that their boots were nicely polished with stove-blacking and their hair smeared carelessly with bear grease denoted that the holiday season was well on, and that they therefore had a just regard for the splendor of their persons, for the useful exactions of good society and for the happy sentiments of the season, the latter strongly evidenced by the assiduous manner in which they kept their glasses well in hand. There was a calmness of manner and a contentedness of spirit in their companionship which might well be envied by the good at heart. Each had a dreamy, beatific expression of countenance which might easily be construed as coming from a good conscience, which was further sanctified by years of noble deeds; but much the same expression may be observed on the visage of a mule which stands quietly in the fence corner of his country home, head drooping, eyes half-closed, and underlip pendulous from the profundity of his enjoyment in the warmth of the spring sunshine. Thus, while the exterior signs of men and mules might be the same, any inference therefrom as to the matter of conscience might be erroneous, for in the case of the mule the contentment came from the sunshine without; in the case of the man, it came from the sunshine within, a portion of which remained in the pitcher for the time being.

The two worthy lilies of the valley had been talking entertainingly of the old year, which was nearly gone, and of the possibility of the year which would be new—for a while—discussing matters with the vivacity which comes from high spirits, and with the affectation of wisdom which comes from mixed spirits; in short, there was that atmosphere of peace and good will about them which so benificently pervades the world in the holiday season, when men cease to battle, and when philanthropy takes the place of selfish rivalry.

"The holiday season, in itself, is a fortune for mankind," Moke remarked, his eyes the while winking jerkily and spontaneously from the sunshine within him. "It is a time when the humanities may be restored or patched up, and when the great social and religious heart can throb to its true sentiments, instead of to the false sentiments of Mammonism. The holiday season, with its humane readjustments, I maintain, is a great boon to the human race."

"Humph!" the Cadi remarked, contemptuously. "The holiday season is indebted to the human race for its existence, and therefore it in part is indebted to you and me. It only exists at all because I am alive, if the matter is reduced to the proper personal equation; that is to say, if I were in the future world, there then would not be any holidays, as I know of them, and no one could then make me believe that there were such; but, there being holidays when I am alive, and none when I have passed away, I am justified in my deduction that they are for me now, and would not exist if I were not here."

"I have heard some very remarkable arguments in my time, my good friend, but never one which was so wholly egotistical. I have heard the argument that the world or the universe existed only in the mind of man; for if man ceased to exist or had never existed there never would have been any cognition that the world existed; and no cognition, no existence. I fear much, my good friend, that some of the wires in the vacant chambers of your head have become crossed, causing your mind to mix the things which serve you for ideas. Let us talk of something useful. Let us talk of some resolutions that I intend to make for the New Year. Yes, and to keep them, too!" And now Moke warmed up to the subject with much enthusiasm. "I suspect that you have the same purpose in mind, friend Cadi, and we might gain an added strength by selecting our resolutions and adopting them jointly; for if they are good when adopted by one they should in reason be twice as good when adopted by two persons."

"Quite right!" the Cadi remarked approvingly. "Then, if one of us should weaken at any time, the other could counsel firmness and encourage his faltering spirit, thus supporting him in his few moments of weakness with that firm moral courage which we both so abundantly possess in common, but which we both lose in common at the moments we most need it. But I have always thought that being good by resolution was much like protecting game by resolution—it looks very well while the actors hold the center of the stage and utter their resolutions, but off the stage they talk and act much as do other people."

"So," Moke commented, in a tone meant to be sarcastic. "I may infer that some people may be good without taking any thought as to how to be better. Don't you think that some good at some time followed a 'Be it resolved'?"

"Certainly, in a general way," replied the Cadi. "But, as to your particular proposition, it is merely a holiday idea, my good friend. You have an emotional feeling at this moment which is in keeping with the closing of the year's events, the glorious theme of the season, and the joyous stimulus radiating from your stomach. Personally, I dislike to admit that I have formed any New Year resolutions, for I will not admit that I need them. I feel that I am all right. It also renders me ineligible to join you in your well-meant purpose of reform. I thank you kindly, but I will have to decline your proposition," saying which the Cadi pushed the pitcher nearer to Moke, whose well-trained hand reached out and caught it before its motion was arrested.

"No. 1."

"You do not seem to be quite yourself to-day," said Moke, with a weird smile, which was intended to be amiable, but which seemed to mean nothing in particular. "I have not made any proposition at all. I asked that we talk over some propositions that I had in mind for the new year. As I have not mentioned what they are, I am sure that you do not know whether they were good, bad or indifferent; but I do think that it costs nothing to be civil, not to say polite."

"I perceive that I was anticipating too much. If you will overlook my curtness, I will now listen with pleasure and with some hope of being a gainer; for ofttimes the wise may learn wisdom from the simple, or, as Cowper more directly states it,

"'A man must now and then be right by chance,'

though of course he could not possibly have had you in mind when he wrote it, and therefore it has no reference to you. I listen to you, my friend," concluded the Cadi, as he crooked his elbow.

"It had escaped me that we were talking of fools," remarked Moke, imperturbably, after he had wiped the cider drops off his mouth on his coat sleeve. "But there are quite a number of authorities on that somewhat large class of useful men. Shakespeare says:

"'The fool doth think he is wise, but the wise man believes himself to be a fool.'

"What do you think of that, Cadi?"

"I don't believe a word about what the wise man believes. In fact, I know he is wrong. But we would better let that pass, for there might be many who would need but a hint to enlarge on this subject, perhaps to our misliking. Tell me now about the good resolution which you discovered at the end of the old year, though you seem to think that you discovered it at the beginning of the new."

"Well, it's this way, Cadi," and Moke commenced talking very seriously. "For some weeks I have been giving a good deal of attention to the study of magic circles and magic squares and lucky numbers, which I found in an old book which had a lot in it about magic. There were things about necromancy and horoscopes. The number 7 seemed to crop up the oftenest, and by common consent it was conceded in some matters of chance to have the greatest potency; but the number that I believe in most was not in the book at all, and that is the number that I am determined to look out for in my New Year resolution."

"What number is that?" queried the Cadi, curiously.

"No. 1," Moke replied quietly.

"Vex Not His Ghost."

"I don't see how you add any to the worth of that number by embodying it in a resolution," remarked the Cadi. "That is simply the vulgar way of expressing inconsiderate selfishness. Everybody should be selfish enough to strive to better their condition while doing good to others. That is to say, every one who works, benefiting himself, benefits mankind at large. If all selfish purpose ceased to exist, all unselfish purpose would cease also. No one would attempt to do anything. The world would be at a standstill. Your idea of looking out for No. 1, as it is vulgarly termed, can mean nothing more than that you are going to work industriously next year instead of idling as in years agone, for you must reward the world at large if it in turn rewards you. It is better to let New Year resolutions alone, unless you intend to confess to yourself and the world that you need annual reformation. It is better to do what is right at all times, and then you will not need any more good resolutions at the end of the old year than you need at the beginning of the new. When the old year dies, you then can say honestly with the poet:

"'Vex not his ghost.'"

BERNARD WATERS.

WESTERN TRAPS.

Chicago Sportsmen's Trophy.

CHICAGO, Ill., Dec. 23.—In the seventh contest for the Chicago sportsmen's trophy, held at Watson's Park yesterday afternoon, Mr. R. Clempson for the second time carried away the handsome diamond medal, and not contented with this he killed 15 straight and won the high average medal also. The capital prize he secured only after a hard fight with Barto and Miller in the ties, both the latter coming into the third frame of fives, Barto killing 4 straight after missing his first bird in the last string. Barto won second, Holly and Stannard divided in the 14-hole, and White shot out Leffingwell in the 12s. The birds ruled mainly fast and strong, with some not quite so good, but on the average making fairly difficult shooting. The weather was mild and pleasant. The following are the scores:

F Holly, 30, 1	11221121*1222011	—14
R Clempson, 30, 0	212121211221222	—15
G Roll, 30, 0	222121111011222	—14
Dennis, 30, 1	2211121221220211	—15
J L White, 30, 1	20222220*2222022	—12
T Eaton, 28, 2	12020*200221021*1	—10
W B Leffingwell, 30, 1	20022221020121122	—12
W D Stannard, 30, 1	22220122222122022	—14
P O'Brien, 30, 1	20212112122122012 01	—14
J B Barto, 30, 1	22221121212 2*212	—15
R B Miller, 28, 2	1*022212121111212	—15
H Levi, 30, 2	122122222222222	—15
E M Steck, 30, 1	01121222222211 2	—15
S Palmer, 30, 1	22122122212202 22	—15

Ties on 15, strings of 5:

Stannard	221	222	222	212—12
Roll	121	111	10w	— 7

Death of Jack Ruble.

On Friday of last week Mr. J. A. Ruble, long familiarly known to all tournament shooters of this country as Jack Ruble, died at his home in Beloit, Wis. Mr. Ruble was naturally a fine shot and was nearly always successful in the sweepstakes among the best shots of the country. He usually shot under the name of Bob White, and has been before the public for the past dozen years. A few years ago he came to this city to reside, and it was about two years ago that he met with the misfortune which eventually caused his death. While going home one night after dark, he was held up by one of the thugs who infest this city during the winter time, and before he had time to defend himself was struck over the head with a piece of iron pipe. Mr. Ruble was a man of very powerful frame, but was taken entirely off his guard. He lay unconscious for a couple of hours, and was in bed for weeks. He never recovered his strength, and all through last summer looked hardly more than a shadow of his former self. His death removes one of the familiar figures of the old-time circuit crowd.

E. HOUGH.

480 CAXTON BUILDING, Chicago, Ill.

Audubon Gun Club.

CHICAGO, Ill., Dec. 29.—The last shoot of the Audubon Gun Club for 1899 resulted as follows:

Wilcox, 28	*21*2122222200020100—12—2—14
Felton, 30	20120101010000121211—12—2—14
Odell, 29	022*1222212212*12121—17—2—19

Mr. J. H. Amberg wins first prize for the year. Messrs. Felton, Wilcox and Odell and five others tied for second, $20 in cash. The three being present to shoot off the tie, they shot with the following results:

Felton	11102021222121222022—17
Wilcox	02211222212020222100—15
Odell	22221212120220221210—17

Second tie, miss-and-out:

Odell	112111	Felton	221120

RAVELRIGG.

Garfield Gun Club.

CHICAGO, Ill., Dec. 23.—This was not a very good day at the Garfield Gun Club. The day was very dark, as the sky was thickly overcast with clouds. The birds were as a rule a good lively lot, there being but one or two sitters during the whole shoot. The old saying of "Business first and pleasure afterward" seemed to be true in the case of Dr. Meek to-day. His business kept him away during the trophy event, and so he missed the best part of the day.

Fanning and Nusly are planning a trip to Demotte, Ind. They will start next Wednesday, and be gone for two or three days, or, as Fanning expressed it, "As long as the inhabitants treated them well." They are going out for quail and chicken sho·

Dr. and Mrs. Shaw are making plans for a trip to Yellowstone Park. From there they will go to Glenwood Springs. Leaving the "Springs" by a stage coach, they will travel for about 70 miles up into the country, where the Doctor expects to find big game.

No. 1 was the trophy event, 10 birds. No. 2 was a sweep at 6 birds, $2 entrance:

	No. 1.	No. 2.

FRANK J. BAUM.

ON LONG ISLAND.

Emerald Gun Club.

Brooklyn, L. I., Dec. 19.—A rainy day was as unfavorable as to weather, the shoot suffering a special misfortune, as there was a philanthropic purpose in it, all the club's interest going to the widow of the late E. A. Vrooms, who was an officer of the club and who was drowned several weeks ago when the ferry boat Chicago was sunk by a collision in the North River. There was a strong straightaway wind, and the birds were a fairly good lot and flew fairly well, considering the unfavorable weather conditions. The attendance, too, was good, and there were several shooters present who were famous in skill. Events Nos. 1, 2, 3 and 4 were miss-and-out events, all standing at 30yds.; Nos. 5 and 6 were handicaps. The scores:

	No. 1.	No. 2.	No. 3.	No. 4.
O'Connell	20	221112	2*	.....
Van Allen	122	12222*	11	222222
Sands	1*	122222	10	0
Leroy	222	222*	22	222222
Koegel	.....	.....	1*	112*

G Meeker	11	24	11	40	15	Lane	..	20	..	27	..
G Ancrom	9	..	12	40	20						

There will be a big holiday shoot on New Year's Day. Prizes: first, $20 gold piece; second $10 gold piece. Open to all. All shooters invited.

GEO. B. PATERSON, Sec'y.

Trap Around Reading.

READING, Pa., Dec. 23.—The annual election of the Schuylkill Gun Club, of this city, was held at the Milmont Hotel, near this city, on Dec. 21, and resulted as follows: President, J. Edmund Gable; Vice-President, Frank Shearer; Secretary and Treasurer, Albert Fink; Captain, Frank Gable; Directors: H. N. Keim, Benjamin Keim, James Hipton. The treasurer reported the club in good financial condition. Retiring Captain Schmeck reported having engaged in three team shoots with the Climax Gun Club, of Gibraltar, and all resulting in a victory for the Schuylkill team, composed of H. N. K., Keim, Flecker, F. Gable, J. E. Gable, Schmeck, captain, with Fink, Shearer and Hipton, as substitutes. It was decided to change the club's shooting grounds from Milmont to a place nearer the city limits, of which the directors have three sites in view. Three names were proposed for membership and two members were elected.

Capt. Gable was instructed to announce the live-bird club championship shoot for Jan. 6, on the Milmont grounds.

The scores made Dec. 21 at the club's annual shoot follow:

Target championship, 25 targets: F. Gable 19, Shearer 12, Fink 21, J. E. Gable 21, H. N. K. 21, Keim 20, *Bright 23, *Sholl 19, Gross 17, *Ritter 20, Schmeck 20, Hinton 12, Brownnell 7, Towney 14, *Ball 17, *Jack 23, *Bechtel 20, Sheeder 19, Schuyler 12, Flecker 17.

*Denotes guests who shot for price of targets only.

The shoot-off of the tie for the gold medal presented by the Milmont Hotel and the club championship, 15 targets, resulted: Fink 11, J. E. Gable 12, H. N. K. 10.

The following sweeps were also shot:

Events:	1	2	3	4	Events:	1	2	3	4
Targets:	10	10	15	10	Targets:	10	10	15	10
J Gable	7	5	12	8	Ritter	7	8	14	7
F Gable	8	7	10	5	Brownnell	6	5	12	8
Fink	7	8	11	8	Towney	3	4	..	6
Schmeck	8	6	11	7	Schuyler	7	4	..	6
Sholl	6	9	10	6	Bechtel	6	5	..	8
Flecker	7	6	11	7	Sheeder	7	4	..	..
Bright	9	10	12	9	H N K	9	8	12	9
Gross	7	6	..	4	Keim	10	9	11	6
Hipton	3	2	12	5	Jack	9	8	14	7

W. D. Gross, proprietor of the Three-Mile Shooting Park, located at Shillington, Pa., three miles from Reading, easily reached by electric car every twenty minutes, announces the opening of the live-bird season for '99-1900, at this fine shooting park. A target match has been arranged between Shaaber, of Reading, and Benner, of Boyertown, 100 targets, $20 a side, and the county championship cup, now held by Shaaber. This match should be a very exciting contest, and a large crowd is expected to be present. The Benner-Shaaber match is on Jan. 1, to be followed by a programme of sweeps at targets. On Jan. 2 live birds will be shot, the principal event being a 15-live-bird handicap, 25 to 31yds., $10 entrance, class shooting. Sweeps will follow. Proprietor Gross also announces a live bird match for Jan. 23 between two well-known local shooters, 100 live birds, $100 a side.

DUSTER.

Fulton Gun Club.

Brooklyn, L. I., Dec. 18.—The main event of the meeting of the Fulton Gunt Club to-day was a two-men team match between Messrs. Schoverling and Dickerson against Messrs. Schneider and Belts, the latter winning by the score of 44 to 42. The scores follow:

Events:	1	2	3	4	5	Events:	1	2	3	4	5
Targets:	10	10	15	15	10	Targets:	10	10	15	15	10

Interstate Association Annual Meeting.

THE annual meeting of the Interstate Association was held Thursday, Dec. 21, at 9:30 A. M., at Oakland, Bergen county, N. J. A majority of the stockholders were represented either in person or by proxy. After the meeting had been formally opened it was decided to adjourn until 2 P. M. the same afternoon, in the rooms of the Sportsmen's Association, 280 Broadway, New York.

At the adjourned meeting, President Dressel in the chair, the roll call showed the following stockholders represented in person: Union Metallic Cartridge Co., J. A. H. Dressel; American E C & Schultze Gunpowder Co., Albert W. Money; Cleveland Target Co., Paul North; Winchester Repeating Arms Co., Irby Bennett; Parker Brothers, W. F. Parker; Hazard Powder Co., John L. Lequin; E. I. Du Pont de Nemours & Co., E. S. Lentilhon; Laflin & Rand Powder Co., A. W. Higgins.

The following were represented by proxy: Tatham & Brothers, Le Roy Shot & Lead Works, Remington Arms Co.

After the minutes of the annual meeting, held Dec. 20, 1898, had been read and approved, Manager Shaner read his report of the proceedings for the year. This report was received with considerable enthusiasm, and at the close Mr. Higgins moved and Mr. North seconded, that the report of the manager be received and filed and a vote of thanks tendered to him, not only for the exhaustive manner in which he had compiled his report, but also for his work in behalf of the Interstate Association during the season of 1899. The report was as follows:

Pittsburg, Pa., Dec. 20.—To the President, Officers and Members of the Interstate Association: Gentlemen—I herewith submit the report of transactions of the manager's office for the season of 1899, the statistical data of which, giving operations in detail, will be found in the "Review of Tournaments," a copy of which is annexed.

It is patent to all that in presenting a series of annual reports, where success has been uniform, some tautology is unavoidable, therefore I launch into my theme without further apology, confident that I am addressing an audience which appreciates the fact.

The season just closed has been, in my opinion, the most successful in the history of the Association, and, though it may seem like painting the lily, I cannot refrain from harping on the possibly threadbare subject. Again our subscribers are to be congratulated on the results directly and indirectly achieved, and on the assurance that the efforts of the Association to give satisfaction have been abundantly crowned with success. The maxim, "Nothing succeeds like success" has been verified yearly since organization, and at length all doubting Thomases exclaim, "I believe!" and are willing to believe us when we tell them that we now find our feet firmly planted and have no acquaintance with the word "fail." Simply pointing to what has been promised and performed silences all carping criticism.

The records of this office, in entirety and severalty, show that the sport of trapshooting is yearly growing stronger, and it will continue to increase just as long as it is conducted on the same clean lines as at present, and uniformly in the past.

Candor compels the admission, however, that some localities where formerly great interest was taken in the sport now show a falling off in enthusiasm, and this loss of interest has led some who are not in touch with the fraternity to believe that interest in trapshooting is on the wane. The initiated and practiced observer, however, can readily detect the cause of and prescribe the remedy for this apathetic state in each individual case. One of the prime causes of lack of interest has been the desire of the more expert class of shooters to increase its exchequer at the expense of its less skillful competitors. This is a radical mistake, and unless club shoots are conducted on a liberal basis, allowing the less expert shooters to compete with the more skillful on equal footing, the sport will continue to languish in the localities noted. One way to remedy the evil is not, under any circumstances, to allow sweepstake shooting on regular club days. Adhere to this policy. Offer trophies to be contested for, either weekly or monthly, and make the shooting cost as little as possible, and I venture the prediction that the sport will soon show a healthy growth. My experience has proven that where the sport is conducted on these lines there is no lack of contestants, much interest is manifested and a friendly rivalry is engendered. It is too much to expect that indifferent shooters will long submit to be mere profit as well as sport to the more expert. There must be sufficient reciprocity to maintain interest, and the true sportsman will not grudge it when his conscience is enlightened by a mere statement of the fact.

The wisdom of the resolution adopted by the Association barring "paid representatives," etc., from competiting for a division of the purse is no longer disputed. The experimental stage has been passed, and many gun clubs are patterning after the parent organization—conducting tournaments on the same lines. I therefore advocate the continued enforcement of the rule which has proved salutary.

Grand American Handicap of 1899.

This was the inaugural tournament, held April 11, 12, and 13, and excited more interest than any previous event of the kind. The extraordinary success of last year led many to suppose that the maximum had been reached beyond peradventure, and the great interest partook somewhat of a speculative nature. Not until the entries had been closed could some people—and many thousands they were—believe that the representation would exceed that of 1898. It is true there were sanguine people, who believed that the entries might reach 300, owing to the improved condition of business, but they were in a minority; and well-posted people, who had had a broad basis for a working hypothesis, contended that 250 would be an extravagant estimate. They reasoned on the basis of high guns and class shooting, and did not make adequate allowance for the enthusiasm engendered by the previous work of our Association. At this distance of time it is safe to say that the great majority were agreeably disappointed. Though the world has been well advised of the fact that the total number of entries was 278, it will bear repetition here. This was 71 greater than the total of 1898. The increase from the day of small beginning, in 1893, with 21 shooters, to 278 entries six years later carries with it its own comment and shows that the Interstate Association built on a firm foundation, and that its growth, phenomenal though it be, has been symmetrical and natural.

The States represented by the entries show the widespread interest excited. They were 28 in number, more than half of the 45 covered by the Stars and Stripes, and the representation ranged from Canada to Mexico, and Canada was not unrepresented. The distribution of entries may not be uninteresting. It was as follows: New York, 42; New Jersey, 41; Illinois, 34; Pennsylvania, 26; Ohio, 19; Iowa, 14; Missouri, 12; Wisconsin, 10; Kentucky, 8; Maryland, 7; Massachusettts, 7; Indiana, 7, Minnesota, 7; Tennessee, 6; South Carolina, 4; Nebraska, 4; Texas, 4; Maine, 3; Georgia, 2; Virginia, 2; California, 2; Michigan, 2; North Carolina, Rhode Island, Arkansas, Colorado and Florida, 1 each; District of Columbia and Canada, 1 each; 278 entries in all. Of this number 135 were new—that is, they had never been entered in any previous Grand American Handicap. This makes a grand total of 510 shooters who have made entry in this event of events since its establishment in 1893.

The selection of the same site for holding the tournament occupied for three years previously needs no defense, for Elkwood Park was the only one that offered the requisite facilities.

Inanimate Target Tournaments.

The opening tournament of the inanimate target season was held at Oil City, Pa., May 17 and 18. It was held under very adverse circumstances, the weather being discouraging in the extreme. The first day, shooters, visitors and all interested were drenched by a terrific downpour of rain. The lightning and thunder severely tried the nerves of contestants, making a large score impossible. Members of the local club, and Oil City people generally, treated visitors so hospitably, however, as to make them forget the inclemency of the weather and consequent discomfort. The management of the shoot left nothing to be desired and the pleasantest impression was carried away.

The third tournament was held at Bellows Falls, Vt., June 14 and 15. It was under the auspices of the Bellow Falls Gun Club, and was a success in every way, although rain somewhat marred the second day's work. The resident club had made arrangements so perfect that there was no room for suggestion for improvement. Fifty-six shooters, only four of whom were manufacturers' representatives, took part. There were many present who had never atttempted shooting, and the success of the meet lay largely in the encouragement given non-professionals and non-shooters to take up the sport. A large number of those present carried away a deeply planted desire to stand in the ranks, and they will be heard from in the future. There is no doubt that the occasion will bear good fruit.

The fourth tournament was held at Providence, R. I., July 19 and 20. As an inanimate target shoot, it was a record-breaker, so far as our Association is concerned, the average entry for each event during the two days being 51 and a fraction.

As to target throwing, the figures are eloquent, and need no diagram in the way of elucidation. There was but one set of five traps used, no magautrap and no Sergeant system. The record was 8,020 bluerocks thrown the first day and 9,285 the second; total 17,305 for the two days.

The Providence Gun Club paid a high tribute to the Interstate Association by declaring that the efficient state of the club and its appointments, as also the revival of interest in trapshooting throughout the length and breadth of Little Rhody, were due to the intelligent work done by the Association in New England. The Association showed how it must be done and created the emulation which has made the Providence club what it is. Yankee pluck can accomplish wonders. For instance, the club house, with all its elegant appointments and utilities, was built in five days, and built substantially, too. It was as clean as a New England kitchen, and no annunciator was needed to tell you that you were at least contiguous to the "land of steady habits."

The Providence Gun Club is a growing organization, and its members are workers of the most pronounced proselyting class. They do not think of doing things by halves or in a perfunctory manner. They will be further heard from.

The fifth tournament, which was also an unqualified success, was held at Portland, Me., on August 9 and 10. It was a record-breaker for the State of Maine, and the members of the home club feel that the shoot was all that could be desired; not a hitch of any kind occurred to mar the pleasantness of the occasion, although a steady rain the second day was somewhat discomforting. The results for our subscribers were splendid, and everything that the local club could do for the comfort of visitors was done.

The proceeds from the targets in event No. 3 the first day, amounting to $15, were donated by the Portland Gun Club to the Van Dyke Memorial Fund.

The closing tournament of the season was held at Portsmouth, Va., Sept. 6 and 7. The attendance was good, and the shooting of a high order, notwithstanding that the weather was oppressively hot, causing many who would otherwise have participated to weaken. The Portsmouth club, however, felt that there was no cause for complaint, and it was well satisfied with results achieved. The shoot ran smoothly from opening to finish, and the members of the home club were satisfied that their efforts to promote a love for trapshooting had not been nugatory and that interest was growing.

The unsolicited encomiums bestowed on the Interstate Association should be sufficient to assure the most conservative among our patrons and subscribers that their efforts to maintain its high standard have not been in vain. The times have been propitious, and we have had our full share of the prosperity that has gladdened not only the affluent, but the humblest household in the land. The previous year we contended with difficulties that prostrated many well-established undertakings, and in 1899 we simply reaped the reward of steady perseverance in the race for the goal set before us. Of course there may be frosts in store for us, but the foundation laid is not in sand, but in the rock of experience and carefully considered method, and its permanence is as well established as any other mundane venture.

The Future.

Though our efforts have been successful beyond expectation, yet I would again call attention to the fact that we ought to have more subscribers. The work is vast and cannot be prosecuted successfully without an outlay that in the infancy of the Association would have been considered both outside and inside the ranks ruinous, but which, with the enlarged views that accompany such success, is no longer considered terrifying. The constantly increasing demand for our services must be honored, and it costs money. For the good of the cause every member should exert himself to the utmost to increase our subscription list. "There is no excellence without labor," and experience in all human vocations teaches that a miracle of genius is also a miracle of effort. There is abundant incentive to work, and work hard, and I think all will agree that our motto should still be "Excelsior." Our zeal should no languor know until we arrive at the summit.

Eighth Annual Grand American Handicap.

For this event the preliminary details have all been arranged, contracts signed, etc. It, as is generally known, will be held at Interstate Park, Borough of Queens, New York city, the week beginning April 2, 1900.

The phenomenal success of the Grand American Handicap since its inception emboldens me to renew a suggestion I thought fit to make in my report of the proceedings of 1898, and which, I flatter myself, was received in the kindly spirit in which it was tendered, i. e., with an eye single to the advancement of the greatest of all events, without disparagement to any. It was emphasized by the gratifying success of the Grand American Handicap of 1899, a success unparalleled in the history of live-bird shooting, where the largest and finest array of skilled shooters ever marshaled on the planet carried the contest to a close without jar or friction. Our Association has not only proved to the world that it is second to none in point of skill in its membership, but it has established on a firm foundation an event which is to the sportsmen of the Western world what the Olympic games were to the ancient Greeks in the zenith of their fame.

As observed in my last annual report, there must of necessity come a time when we shall reach our maximum and cease to grow. I do not know that it has been attained, but would respectfully suggest that ere we may possibly ride a free horse to death it may be prudent to call a halt for the purpose of taking a reckoning of our reserve capital and be prepared to grow old as gracefuly as we have grown rapidly. As the Interstate Association has reached an eminence where it can view with complacency any strictures the most carping can make, I am of the opinion that this is a fitting time to take an observation from this serene height where whatever action we may take is to criticism impregnable.

I would emphasize the fact that from a managerial standpoint 278 entries are not unwieldy, and from experience gained this year I believe it possible to manage the Grand American Handicap successfully even up to the point of 400 or more entries; but in the interest of contestants to have a greater number of entries than those of this year would, in my opinion, tend to cheapen our annual contest by reducing it to the level of a show, which we are not by any visible exigency constrained to do.

I think the Grand American Handicap has accomplished all the Interstate Association proposed in the outset, and probably more; but to continue to allow more and more entries would, in my view and that of many others, be retrogressive. It has reached that point where it cannot be the ambition of any to make it the largest, but the best in existence.

In my judgment the Grand American Handicap should be so arranged as to make conditions harder without departing from our system, and made so that it can be shot in one day. Without detracting from the interest in the least, conditions might be made so that contestants would not exceed 100.

In my last annual report I called attention to the fact that "should entries to the Grand American Handicap drop to 100, it would still be the finest of its kind—still excel the Grand Prix of Monte Carlo—still be in a class by itself, and so far as can be seen unapproached and unapproachable." By limiting the number of entries we do away with otherwise possibly unavoidable mishaps, such as changes of weather, sudden illness of contestants and other demands which readily present themselves to all. It is certain that the Grand American Handicap has become a very severe strain on contestants, though the stoical fortitude which sustained them in the last trial may not have impressed outsiders as it did those whose duties compelled them to follow with scrutiny every phase of the contest.

I would reiterate that there is no intent nor need to change the system, but to make the conditions harder, and I feel confident that this will meet the views of sportsmen, who would rather fail nobly contesting under difficulties than win what might possibly degenerate in a barren honor, where conditions were made easy, inducing a multitude to compete, no matter how much outclassed.

I do not wish to be understood as advocating that the entire tournament be conducted on such rigid lines, but the main event only—the Grand American Handicap—the remainder of the programme to be arranged in a manner similar to our previous tournaments, and if deemed advisable one event could be on the precise lines of former Grand American Handicaps, which would tend to include an entry as large as formerly.

Whatever view may be taken of these suggestions, I wish to be understood as making them with an eye single to the best interests of the Insterstate Association devoid of any selfish consideration whatever, and though neither a prophet nor the son of a prophet, I am honestly convinced that time will prove my prognostications correct.

First Annual Grand American Handicap at Targets.

Arrangements have been made for the holding of the first annual Grand American Handicap at targets, at Interstate Park, Borough of Queens, New York city, the week beginning June 11, 1900. So far as I am able to see, there is no reason why this event should not become a feature as permanent and one as important in its way as the Grand American Handicap at live birds. That it will fill a long-felt want, I have not a shadow of doubt.

Inanimate Target Tournaments for 1900.

We have several applications for tournaments during the season of 1900, and there is nothing discouraging to be seen on our horizon. We are now in touch as much, if not more, with the progressive element in trapshooting as in the past, but though the plums may fall into our lap without much effort on our part, I would restate my opinion submitted a year ago, viz.: "That the Association should not rest on its laurels." While some may consider the field already large enough for good tillage, none will deny that if it be, there should be no relaxation of effort to make all our work as perfect as possible. But as yet there is no sign of senility. Our organization is as vigorous as at any former period, and so far as can be seen is competnt to enlarge its sphere indefinitely. There is plenty of territory yet to work, and if we persevere we will live to see, in all probability, that our career of conquest and usefulness has been but fairly begun.

General and Particular.

In closing my review of the year, I wish to impress strongly on the members of the Association that our outfit is very nearly worn out, and will not answer for another season. The demand for a new one is imperative.

As to the duties of my office, I have nothing to add to what was said last year. There are many things in connection therewith in the matter of correspondence, etc., which, though of interest to myself, are not to the Association as a whole.

The rule allowing clubs to exercise their own judgment as to handicap, system of division of purses, etc., as they may deem best, has worked so well that I can see no reason to counsel a change, and therefore I would advise a continuance until something well matured and highly recommending its expediency be submitted.

The Association property is still well taken care of, and stored in Pittsburg, and adequately protected by insurance.

Conclusion.

I would again call attention to the obligations under which the Association rests to the sportsmen's journals for the continuance of their work. They have satisfied the demands of the most exacting in reporting the scores of our tournaments and in publishing matters of general and particular interest to our subscribers, keeping the work well before the public. As honorary member of the Association they are entitled to unstinted praise for their efficiency and courtesy.

I cannot close without a renewal of my thanks to our subscribers for the urbanity with which they have treated me in all our relations, public and private. My duties have entailed a very large epistolary correspondence, and the courtesy I have experienced has made it a pleasure, which lessened the labor. As before, I wish to include the members of all committees, whose aid and advice have always been of inestimable value to me and I will conclude by expressing the sanguine belief that our relations will never be marred. Very respectfully submitted.

ELMER E. SHANER, Manager.

A new member was elected as a stockholder of the Interstate Association; this was the International Smokeless Powder & Dynamite Co., which was represented at the meeting by Mr. Chas. E. Willard.

The secretary then read a letter from each of the clubs for whom the Interstate Association had given a target tournament during the past year. The clubs were: The Oil City Gun Club, Oil City, Pa., and the clubs at Bellows Falls, Vt.; Providence, R. I.; Portland, Me., and Portsmouth, N. H. Each of these letters was in itself a pleasing testimonial to the work accomplished by the Interstate Association.

Manager Shaner reported that he had received applications for tournaments in 1900 from clubs located at the following cities: Belleville, Ont.; Salem, N. Y.; Providence, R. I.; Savannah, Ga.; Haverhill, Mass.; Brockton, Mass.; Sherbrooke, Ont.; Auburn, Me.; Trenton, N. J.; Richmond, Va.; Newport, Vt.

These applications were referred for consideration to the tournament committee, which later decided that no action be taken on them until after the decision of the Grand American Handicap, the first week in April.

Among other business transactions of the meeting, it was decided to change the name of the target tournament, advertised to be given by the Interstate Association at Interstate Park during the week commencing June 11, 1900, from "the first annual Grand American Handicap target tournament" to "the Interstate Association's first annual handicap target tournament." The change was made in order to avoid any possible confusion in the minds of shooters by the use of the words "Grand American Handicap" in connection with targets.

In regard to the conditions that will govern the Grand American Handicap of 1900, no change was made; the conditions will be precisely the same as those which prevailed in 1899, when the enormous entry list of 278 was recorded.

The election of five directors closed the business before the meeting. The following were declared duly elected: J. A. H. Dressel, Irby Bennett, Edward Banks, A. W. Higgins and John L. Lequin.

After the meeting of the stockholders had adjourned, a meeting of the board of directors was held, for the election of officers for the Association. The following were duly elected: J. A. H. Dressel, President; Irby Bennett, Vice-President; Edward Banks, Secretary-Treasurer.

Executive Committee—John L. Lequin, Irby Bennett and A. W. Higgins.

Tournament Committee—Irby Bennett, J. A. H. Dressel, A. W. Higgins, W. F. Parker, Edward Banks and E. S. Lentilhon.

Club Organization Committee—O. D. Delano, Paul North, Chas. Tatham and C. E. Willard.

Mr. Elmer E. Shaner was of course reappointed manager for the ensuing year.

It may be of interest to the shooting public to learn that the Association will follow the plan adopted in 1893, and will again offer a handsome silver trophy to the winner of the Grand American Handicap of 1900.

Irate Boarder—Just look at that thermometer—14° in the shade—and your advertisement called this the coolest spot in the mountains.

Landlord—Waal, it was when the advertisement was written.

Irate Boarder—When was that?

Landlord—Last January.—Harper's Bazar.

PUBLISHERS' DEPARTMENT.

A New New York Central Map.

THE growing appreciation of the use, of the beauty in the statement of facts is well exemplified in a map just issued by the General Passenger Agents of the New York Central Lines. Intended largely for foreign distribution, this new map consists of a beautiful and accurate delineation of the United States on a sheet 20 by 48 inches in size, the ocean spaces in the corners being utilized for smaller-scale maps of the Atlantic Ocean and Europe, the Pacific Ocean, with the Asiatic coast and Australia and Alaska.

The map shows all the railroads in the United States, but refers especially to the New York Central system, which embraces in its through-car lines the New York Central & Hudson River, Boston & Albany, Lake Shore & Michigan Southern, Michigan Central, "Big Four Route" and Pittsburg & Lake Erie Railways.

An interesting feature of the map is the treatment of the mountains. Contour lines are introduced showing elevations, and the slopes are heavily shaded to give "lift" to the higher ranges and peaks, with the result that these features stand out in bold relief as though modeled in clay.

A copy of No. 21 of the New York Central "Four-Track Series," which contains, in addition to this very valuable map, a large amount of information of interest to all travelers, will be sent free, post paid, on receipt of 3 cents, by George H. Daniels, General Passenger Agent, New York Central Railroad, Grand Central Station, New York.—*Adv.*

Whether it is as a manufacturer of graphite as lubricant for the winning American yacht or of graphite for the editorial pencil, the Joseph Dixon Crucible Co. stands easily in the lead. This is not very surprising, since the company has been making the lubricant and the pencils for lo these many years, and ought by this time to be familiar with the idosyncrasies of the material which they are handling. If it is a joy to sail the winning yacht over the line, it is a least a comfort to write with the Dixon pencil.—*Adv.*
